SMITHSONIAN LIBRARY

FOREST AND STREAM.

INDEX---VOLUME 8.

ANSWERS TO CORRESPONDENTS.

PAGE.

A Good Drawing Book.....35
Alligator Hides—Their Value.....345
A Pleasant Pedestrian Tour.....265
Army Pattern Brogans—Where to Get.....67
Artificial Eyes of Birds, Etc.—Where to Get..179
August Shooting—Where to Go For.....147
Best Hunting and Fishing Port in Maine....35
Best Light for Floating for Deer.....67
Bird Skins and Eggs.....68
Beach Shooting.....285
Best Catfish Bait.....115
Best Jumping on Record.....99
Black Bass for Stocking Streams.....83
Bogardus Glass Balls—Cost, Etc....147, 163, 265
Birds Eggs and Skins—Where to Buy.....83
Bleaching Sponges.....445
Blooming Grove Park as a Summer Resort...245
Brant and Goose Shooting.....19
BOATS AND BOATING:
Adirondack Boats—Where to Get.....163, 211
Best Model for a Boat.....67
Birch Bark Canoes—Where to Get.....147
Boat Builders.....147, 385
Boats and Canoes.....325
Boating Resorts.....147
Canvas Canoes.....5
Cat vs. Sloop-Rigged Boats.....35
Duty on a Boat from Canada.....67
Gigs, Shells and Open Boats—Difference...405
Most Suitable Cloth for Cat-sail.....99
Rowing for Money Bars from Amateur Rowing.....131
Varnish for Paper Boats.....51
California Salmon Fry—Where to Get.....245
Camping Tents—Where to Get.....67
Cane Growing in Florida.....5
Can Steam be Seen?.....147
Capt. Borgardus and the Champion Badge....385
Care of Pets—Works on.....445
Catfish—Different Varieties.....325
Catskills for Camping.....13
Cause of Fish Dying in Ponds.....147
Caviare—How Prepared.....179
Cisco.....179
Colorado for Farming, Trapping and Hunting.....5, 195
Conditions of Salmon and Shad Rising to a Fly.....385
Creedmoor Rules, Targets, &c.—Where to Get.....345, 385
"Dead Shot" Powder—Where to Get.....385
Duck Shooting Resorts...5, 19, 35, 51, 67, 99, 163
Do Frogs Eat Trout Spawn?.....365
Do Perch Rise to the Fly?.....163
Eels—Propagation of.....51
Elk—Easternmost Range of.....35
English Shot—Where to Get.....345
English Snipe on Delaware Marshes.....115
English Sparrows—Where to Get.....285
English Sparrows—Do they Migrate?.....115
Fastest Running Time.....325
Fish Culture—Best Work on.....131
Fish of the Hudson River.....195
FISHING RESORTS.....3, 67, 99, 131, 147, 211, 265, 285, 345, 385, 425, 445
Bass and Weak Fishing.....163, 179
Black Bass Fishing Resorts....83, 131, 179, 277, 225, 425
Pike Fishing.....131
Striped Bass Fishing.....211, 285, 445
Trout Fishing Resorts.....149, 179, 211, 227, 245, 285, 325, 345, 365, 385, 405, 425
Fishing "Up Stream" and "Down".....227
Flies and Fly-Tying—Fly Fishing.....5, 19, 83, 131, 179, 195, 325
Florida—Climate, Map of, etc.....51, 131
Food for Orioles.....345
Food for Red Cross-Bills.....147
Food for Young Mocking Birds.....425
Foreign Sporting Papers.....285
Game in Florida.....425
Game Laws and Close Seasons (See also Game Protection)....265, 285, 345, 365, 425, 445
Game Shipment to Europe.....179
Gold Fish Breeding.....131
Golden Pheasants—Cost of.....19
Grackle—Different Species.....35
Hazard's Ducking and Electric Powder.....35
Herbert's Notes.....115, 195
GUNS—As to Loading, Ammunition, etc...5, 19, 35, 51, 67, 83, 115, 130, 163, 179, 211, 265, 345, 365, 385, 405, 425, 445
Altering Guns....5, 19, 35, 83, 99, 147, 163, 179, 205, 211, 245, 345
Best Length and Weight of Guns for Off-Hand Shooting.....245, 445
Best Sized Gun for General Shooting.....365
Choke Boring Guns.....5, 19, 35
Damascus Double Barrels—Where to Get.. 83
Gun Used by Bogardus.....426
Guns With Two Sets of Barrels.....195
Lubricant for Shells.....163
Magazine Rifles.....445
Size of Shot for Pigeon Matches.....51
Various Guns.....5, 19, 35, 67, 83, 115, 131, 163, 179, 245, 265, 285, 305, 325, 345, 445
What Became of the Centennial Exhibits... 5
KENNEL:
Are Dogs Property?.....19
Beagles—Where to Get.....265
Best Book on Dogs.....115
Best Dog for Florida Hunting.....445
Best Dog for Hares and Foxes.....99
Best Duck Dog.....265
Best Food for Pups.....245
Best Imported Setters—Where to Get..67, 345

FOREST AND STREAM

Devoted To

Out-door Recreation and Study.

Game Protection, Fish Culture, Natural History, Preservation of Forests, Rifle Practice, Yachting, Boating, the Kennel, and Sports of all Kinds.

Terms, Four Dollars a Year. Ten Cents a Copy.

NEW YORK, THURSDAY, FEBRUARY 8, 1877.

Volume 8, Number 1. 17 Chatham St. (City Hall Sqr.)

A FRIENDLY SERVICE.

For Forest and Stream.

A Day of Sport in Texas.

ON Saturday, the 6th inst., I received an invitation from Mr. J. G. Tracy, Secretary of the Houston & Texas Western Railway, to accompany a party of officials of the road to its present terminus on the following Monday. This road is intended to run to the Rio Grande, but as yet only thirty-one miles have been built from Houston. I knew that the prairies through which it passes are at this season of the year swarming with wild fowl, and I knew that we might have a merry time of it with the dog and gun. I, therefore, accepted the invitation with alacrity, and forthwith called upon a young gentleman of Houston, who has two as fine bird-dogs as ever followed a sportsman, to induce him to join in the excursion. Unfortunately I found him sick with a cold, and unable to go, which was a bitter disappointment to me, as I was utterly dogless myself. My friend offered me his dogs, but the rascals could not be persuaded to accompany me. They looked at me and wagged their tails, as if they meant to say: "You are very good looking, but you can't come in," and with all the coaxing I could do, refused to budge an inch.

At ten o'clock Monday morning I was at the depot, armed with double-barrel gun, and considerably weighed down with ammunition. (The splendid sporting costumes advertised in your columns haven't found their way to Texas yet.) It was a bright, ringing morning, as clear as a silver bell, not a cloud in the sky, and one of those singular "Texas Northers" piping away at a tremendous rate. The temperature was a point or two below freezing, an unusual thing for this latitude. Soon I was joined by Maj. J. W. Goodwin, Chief Engineer, and shortly after him came a company of about a dozen, nearly all bearing shot-guns or rifles, but not one with a dog. I asked Mr. Peter Floeck, a Houston banker, and Vice-President of the road: "Why is it that you bring no dogs?" Said he, "we need no dogs. Dogs would only be in the way. We shall have plenty of fun without them." Presently came Mr. J. G. Tracy, in charge of a large box, over the edges of which a great many bottles were seen poking their interesting heads. A huge demijohn also accompanied the box.

The object of this trip was to give the State Railroad Inspector a chance to examine and report upon the last ten miles completed on this road. If his report should be favorable, it entitles the company to a donation from the State of sixteen sections, or ten thousand two hundred and forty acres of land for each mile of road, and also allows them to sell bonds to the amount of $10,000 per mile. A number, like myself, took advantage of the trip for pleasure and observation.

At 10:15 the whistle blew, and all jumped on board. This road has a guage of only three feet, and the coach provided for us seemed so small, that I thought we should have a jam of it, but after all were seated there was plenty of room for more. The little coach had capacity for about thirty-six, and our party did not reach twenty. The train moved off slowly, not more than ten or twelve miles an hour, in order to give a number of strangers an opportunity to observe

THE COUNTRY

through which we were passing. I took a stand outside, in spite of the chilling norther, to take notes of the same. After clearing the outskirts of Houston, it seemed an interminable ocean of prairie, except that a few miles to the north and south of us were two great lines of timber, extending westward as far as the eye could reach. That to the right of us was the forests of Buffalo Bayou; that to the left, the forests of Brag's Bayou. The road passed nearly equi-distant between the two, over a plain utterly treeless, smooth as a billiard table, and covered over at this season with a dense matting of grass. There were, however, no cattle upon this great natural pasture. The furious norther had driven them all to seek the shelter of the forests.

Neither were there any farms at all upon this great prairie, after passing three or four miles from Houston; but the land lay virgin and untouched, just as God made it. The soil is almost jet black, and evidently very strong. Give it drainage in the direction of the bayous to the right and left, and put a thrifty population upon it, and this great virgin field would soon blossom like a garden. And the day will not be long delayed before a great garden it will be. Fertile soil, genial climate, producing almost anything, easy access to market—a thriving city almost in

in sight—how can it be otherwise? I asked at what these lands could be purchased now, and was told "from fifty cents to a dollar an acre." But then where are you going to get your fuel from, and your timber for fencing? When this road reaches the great Brazos "Bottoms," only a few miles from its present terminus, it will deliver you splendid oak from two and a half to three dollars a cord, and the vast pineries just east of Houston will furnish illimitable resources for plank fences, cheaper perhaps than in any prairie country in the world. And then before the plank fence decays, the pyracanth and osage orange hedges will be ready to take its place, lasting till the crack of doom. When that thrifty population comes, this prairie may well say: "Match me, ye gods!"

AT THE TERMINUS.

About 1 p. m. we reached "Wimberly," where the road now stops. I thought that as this place has a local habitation and a name, I should find it also a village or something of that sort; but there was not even a house, or the sign of one! The road stopped short in the midst of a solitary prairie, and Wimberly existed only in name. I felt severely disappointed at this dreary prospect, as visions of a snug saloon and hot punches had for some time been tempting my appetite; and, moreover, I was hungry, and chilled to the bone. However, Mr. Secretary Tracy soon announced good cheer. Standing in the door of the apartment of the coach intended for baggage, he announced in a loud voice: "Gentlemen, walk up, roll up, tumble up—any way so you get up—and let us have something that is good. As I knew that Wimberly was as yet unprovided with hotels and saloons, and ever mindful of the comforts of the wayfarer, I have brought both hotel and saloon along with us. If any man cannot here find good cheer, let him charge it to the fault of his own stomach, which does not know how to appreciate things that are good."

In sooth it was so. Going forward I found both hotel and saloon. There were wines, whiskies, brandies, of which all partook amply; there were meats, breads, condiments and fruits, of which all stored away a heavy cargo. After this it was arranged that the party, or all who choose, should break into groups and spend three hours in hunting, but that we must not go beyond the sound of the whistle, for fear some of us might be lost or not get back in time.

THE HUNT.

As I had chatted much with Major Goodwin on the way, we naturally consorted together when the parties were made up. He is physically a splendid specimen of a man, and I found him as sparkling as a bowl of champagne punch. He was all sprightliness and joviality. He was, as I am told, a favorite engineer of the great southern general, Lee, and is responsible for many of the fortifications around Richmond and Petersburg, against which the Union army battled so long. He, too, was armed with a double-barrel shot gun. We struck out alone in a direction which none others had taken. By this time clouds had covered the whole heavens, and there was a heavy driving mist, scudding rapidly before the norther—behooved us now all our stores of viands and fluid stimulants to keep us warm. We had walked only about two hundred yards, when suddenly a flock of

PRAIRIE HENS OR GROUSE

rose almost from beneath our feet. We were not expecting them, and no shot was fired. They flew but a little distance and we pursued. When they rose again each of us fired two shots, Major Goodwin getting two birds, while I got but one. They were noble fellows, about three pounds weight, and as fat as butter balls. So large were they, and so steady their flight, that it seemed almost impossible to miss them on the wing, and yet I had failed with one barrel. Never mind, it is a long time since I have played the sportsman. I have not got my hand in yet. Major Goodwin kept his eye on the living, while I picked up the dead birds. Again they rose, somewhat scattered, and each of us got one apiece, firing one barrel each. "Now," said Major Goodwin, as we bagged the game, "we will let these fellows alone. We must have some of that flock for seed." We had bagged but five, and it seemed to me there were at least a dozen left; and as they had again gone but a little distance I objected, and proposed that we renew the attack, remarking that I feared that if we gave them up we should find no more. The Major said, "Oh, we cannot go amiss for them. The country is full of them. We shall find plenty." He then stated that this bird is rapidly increasing in Texas; that they are more numerous this year than ever, and that he supposed that it was on account of the increasing farms. His opinion was that the grains of the farmers encouraged them to increase and multiply, and that they are a bird that loves proximity to human habitation. "I guess," added he, "they are nothing but stray chickens after all, and have had their characteristics permanently fixed by long in-and-in breeding."

SAND HILL CRANES.

Passing to the southwest some fifteen minutes more, carrying our guns nearly at "present arms," I observed, some three or four hundred yards off, through the driving mist, an assemblage of moving objects, which I at first took to be a herd of deer. A more careful examination soon revolved them into birds, and my companion cried out: "Sand-hill cranes! Now to get a shot at them we will have to be sharp."

He proposed that we separate and march upon them from opposite quarters, the idea being that if one of us could get a shot at them while they were on the ground, they might give the other a chance by flying over his head. We withdrew the grouse charges from our guns and loaded with heavier metal. He struck off obliquely to the northwest, while I obliqued to the southwest. After getting directly opposite to the cranes, both began to move slowly directly upon them. They had not yet noticed us, or had not appeared to do so, though we were now within two hundred yards of them. They were feeding leisurely towards me, but gradually tending to the west. At last they perceived Major Goodwin, and began moving in a course which, if continued, would bring them within fifty yards to the west of my position. I concealed myself behind a small thicket of briars, which gave just screen enough to hide me. I cocked both barrels, and watched the tall birds as they were marching gracefully towards destruction. As they drew nearer and nearer, I was seized with a regular "buck-ague," and shook at a terrible rate. I drew from my pocket a flask of brandy, and emptied almost the entire contents down my throat. By this time the birds were easily within fifty yards, and I raised my gun, still having the ague, and fired quite at random into the array. Without noticing the effect of my shot, I gave them the second barrel as they rose into the air, and saw one big fellow tumble fluttering to the ground. Instead of going towards Major Goodwin, the flock flew to the southwest, doubtless seeking the advantage of the wind to get away as quick as possible from such dangerous quarters. My friend had not got a shot at all, at which I felt somewhat chagrined. My first shot had also been effective, and I had two sand-hill cranes.

These birds are majestic to look at. They stand about three feet high, and move with a stately motion, much resembling at a distance that of a deer. They are, also, about the color of a deer. Their weight does not come up to expectations. They are mainly feathers, legs, neck and tail. Seven to nine pounds is about the best of their weight. They are excellent for the table when well cooked, but if the cook be not skillful they are apt to be too dry. They are extremely numerous on the prairies of Texas in the winter, and are not at all addicted to water, so far as I have been able to observe. They migrate northward on the approach of spring.

These birds were too big to thrust in our game bags. The best that we could do was to sling them around our necks with a string tied to each of their feet, and let them dangle down our backs.

ENCOUNTER WITH WILD GEESE.

The timber of Buffalo Bayou was now close at hand. We had crossed this stream a few miles east of Wimberly, so that it was now south of us instead of north, as it had been most of the way. We moved to the stream, expecting to way-lay a colony of ducks, but just as we reached the edge of the timber, a large flock of geese crossed the bayou a few hundred yards above us, and appeared to light on the prairie just beyond. We now abandoned all idea of ducks in our eagerness to attack the larger game. Crossing the narrow channel on a fallen tree, we crept stealthily to the edge of the timber on the south bank, and saw the geese feeding about two hundred paces above us. They were waddling along slowly towards us. Leaving the edge of the timbers, we walked cautiously up the bank of the stream until we thought we were about opposite the geese, then turned short off to the left. When we got to the edge of the forest again there were the geese, still unsuspicious, not more than sixty yards off, and drawing closer and closer to us. We arranged that Major Goodwin should shoot into them on the ground, and that I should deliver fire as they rose into the air. The Major fired both barrels almost simultaneously, and I turned loose with both of mine just as the birds were flopping their wings in the air. There was a fluttering and a flopping for you! The Major had killed three, and I had brought down too. Now, thought I, here is a mess! How are we going to transport this game? The best we could do was to tie their feet to a string, then fling them over our backs with the cranes, and then abandon the chase. We had as much game as we could well get along with. Said the Major: "The next time we go gunning we will take an ambulance." We trudged back to "Wimberly," treating with the utmost indifference several flocks of prairie-hens that we flushed on the way. They were secure, because we were already gorged.

Shortly after our return to Wimberly the other hunting parties dropped in, one by one, all more or less laden with game. The last that came up, but one, was Floeck, who came staggering under the weight of an enormous buck, which he bore on his shoulder. He had disembowelled the animal where he had fallen; and so saturated with the buck's blood was his clothing, that he might have been easily mistaken for a butcher just out of the slaughter pen. As he threw the buck down he remarked: "I might have got another the easiest in the world, but I had in this fellow about as much as I could well stand under, and my *compadre* would not consent to shoulder the responsibility." He had shot the buck with a splendid Winchester rifle, which he had had manufactured to order at a cost of $150. After Mr. Floeck came the last of the party—a boy who had confined himself to blackbirds, and who had stuffed his game-bag and pockets full.

THE GRAND RESULT.

When all were in, a census of the day's slaughter was taken with this result: Deer, 1; Prairie Hens, 23; Ducks, 9; Geese, 10; Cranes, 4; Blackbirds, 59; Quail, 7; Hawks, 1; Owls, 2; Hares, 1. The thirteen-year old boy who had shot the blackbirds was declared champion of the day. Said he: "I could have killed a million if I'd had a wagon to pack 'em." I asked what would be the money value of our game in the Houston market? Mr. Tracy said the grouse and ducks would readily bring twenty-five cents each; the cranes fifty cents; the geese seventy-five cents, and the quail ten. A gentleman from Ohio, who was of the party, said: "What a grand country is this, where even men's sports will make them money!"

On the return trip to Houston we found the prairies so filled with geese and grouse that several were shot down from the cars while in motion. These, by common consent, were given to Conductor Davis, and I believe his share obtained in this way was larger than that of any other single individual.

"WET-WEATHER BIRDS."

While on the return trip I noticed hundreds of flocks of very diminutive birds, much resembling the summer sparrow, but of a lighter color. They seemed to go in thousands, so that scores of them might be taken at a shot. Mr. Tracy said they were the sweetest and fattest little birds in the world, but that it took "just two dozen to make a breakfast for one." Another said that he called them "wet-weather birds," "for," said he, "in wet or damp weather the prairies are filled with them, and in dry weather they are never seen. What becomes of them is past finding out. I think they disband and take to the forests."

AT HOME.

We reached Houston just after dark, the norther giving us a stern welcome as we leaped from the coach. We all parted happier, heartier, and I hope better than when we met in the morning. I hope to tell you, Mr. Editor, of many another day's sport around Wimberly. In the meantime, you can say to Dr. Dio Lewis, that what he says about goose-meat not being good, is all pure fiction. Give me lots of fat, tender goose meat. N. A. T.

Houston, Texas, Jan. 14th, 1877.

For Forest and Stream.

FOX HUNTING IN OHIO.

THINKING a detail of how we hunt foxes in Ohio may interest some of your readers, I will give you a brief description.

The sportsmen get together and decide upon a day and place for a hunt, elect their chief officer and a captain for each side, then advertise the day agreed upon, the territory they propose surrounding (which is generally about four square miles), and the hour for starting in towards the centre. The centre is designated by a tall flag staff and the stars and stripes floating therefrom. A small brush tent is also put up for the foxes to hide in and rest when cornered. After closing in on a space about ten rods square and allowing the foxes a few minutes' rest, the sport then begins. If a band is along they step in the enclosure and serenade what of the Reynard family may be housed there. Each side is then allowed to send in one person, generally a boy about 16 years of age; the strife then is to see which side will have the honor of catching the first or most foxes. They must catch them by the tail and lift them up clear from the ground at arm's length. No dogs, firearms, or clubs, are allowed on the ground, whereby the foxes may be injured, until after all the sport is had with them that is wanted. They are then sold to the highest bidder, the proceeds going towards paying the advertising.

Sometimes when there is an old sly fox cornered, he makes the attempt to break through the ranks, but is caught and thrown back in the enclosure, and sneaks off as though he was ashamed of the trick. We had seven or eight of those hunts last winter, and on some occasions a thousand or more persons would participate in the sport.

One night in December there fell about four inches of snow, and in the morning my brother Will says, "Buck, this is a good day to hunt foxes; won't you go?" I must confess I did not need much coaxing, as I am a lover of sport. So I put my breech-loader together and took a few cartridges of F. F. shot, called the dog, and started for the woods where we thought we would be most likely to find a fox. We had not got ten rods in the woods before we found where one had been along. We followed up the trail and soon the tracks became so plenty we could not keep one particular track, for sometimes three or four would be going along together, and when they diverged we could not tell one from another. We concluded we would skirt around on the outer edge of the woods, and perhaps we might find where one had left for some other piece of timber. We soon struck a track that seemed to be leading off, and after following about half a mile we found where he had gone down inside of a large poplar stump and into a hole under a root. We ran a pole down some distance, but could not feel him. Will then started for a spade and pick to dig him out. About the time he got to the house, which was about 80 rods off, the fox came to the conclusion that he had better try leg bail for it, and so jumped out, knocking my dog off the stump backwards. I undertook to give him a load of shot as he started off, but the cartridge failed to explode, and before I could get the second barrel ready the dog was between me and the fox. There was a nice race then for about half a mile before my dog overhauled him. There was some tall fighting done there by the looks of the snow and the noise they made. We took his hide and started for home, having had sport enough for one day. We had not gone more than half a mile before we struck another track and followed it about ten rods and found a fox curled up in the hollow of a tree. When we came up he went up in the hollow. We got an ax and soon had him out. They were both very large gray foxes. BUCK SHOT.

WHAT IS AN INCH OF RAIN?—An English acre consists of 6,272,640 square inches; and an inch deep of rain on an acre yields 6,272,640 cubic inches of water, which at 277·274 cubic inches to the gallon makes 22·622·5 gallons; and, as a gallon of distilled water weighs 10 lbs., the rainfall on an acre is 226,225 lbs. avoirdupois; as 2,240 lbs. are a ton, an inch deep of rain weighs 100·993 tons, or nearly 101 tons per acre. For every 100th of an inch a ton of water falls per acre.

—Eight thousand nine hundred and ninety quail have been shipped from Salisbury, N. C., this season.

Fig. 2.

Fish Culture.

Fish Hatching Apparatus.—Mr. Samuel Wilmot, of the establishment at Newcastle, Canada, sends us the diagram of a patent that he has secured for a white fish hatching apparatus, and which we think so well of that we present it herewith. Mr. Wilmot tells us that he has had it going this winter and it answers beautifully. The can, or hatching apparatus, is just eleven inches in diameter, and about five or six inches deep, into which are put 100,000 white fish ova when first taken from the fish. It is then set a going by turning a small tap, which lets in say a ¼ inch stream of water, depending much upon the head. The eggs are put in motion by the action of the water, all sediment and bad eggs are carried away, and the sound ones are left as clean as when taken from the fish. Hand picking is, therefore, almost done away with. Mr. Wilmot says:—

"These self pickers and cleaners, with say five or six millions of white fish eggs, will save the labor of four or five hands daily, and will, at the same time, keep them cleaner than it is possible to do with *any amount of hand washing*. I have had some of these pickers going since 1st Nov. last; many of the young fry are now hatching out. Therefore, the practical working of them is all that could be needed."

ABSTRACT OF THE SECOND ANNUAL REPORT OF THE STATE COMMISSIONERS AND SUPERINTENDENT OF THE MICHIGAN STATE FISHERIES.

We are indebted to Mr. Geo. H. Jerome, Superintendent of State Fisheries, of a copy of the above valuable and comprehensive report. As it covers the operations for the year 1875-6, however, it is impossible for us to more than glance at the work accomplished during that period.

Notwithstanding the fact that it is but little over three years since the pisicultural work of the State was commenced, it is claimed that Michigan in the magnitude and success of her fish cultural enterprises is the inferior of no one of the twenty-two fish States. The great cordon of lakes which fringes all the eastern, western and northern boundaries, the grandest bodies of fresh water to be found on the globe, gives her the largest and finest water farm to be found on the continent.

Although some information has been received touching the success of the various fish plantings, yet the information is by no means as full as was hoped for, and as is desired. Of the shad planting no very reliable returns have been sent in; nor, indeed, is it yet hardly time to expect news from them, as they are ever slow in reporting themselves, in New York and other States little or no trace of them being discovered till the third or fourth year after their deposit. Salmon have been caught in the St. Josephs river with all the markings and characteristics of the Atlantic salmon, and weighing about two pounds each. Others have been taken in Lake Erie, which are supposed to have been placed in the Raison River by the Michigan Commissioners in 1874. Favorable accounts have been received from various quarters regarding the whitefish planted.

Of the varieties of fish at the Pokagon State Hatchery, all have done fairly well. They have been fed resonably well, but not regularly, fish meat not being always readily obtainable. In general health and growth the grayling stands, perhaps, number one. The speckled trout are barely second in the list. A healthier, handsomer collection of brook trout, have never been seen in any pond. The California salmon, while apparently less healthy than their cousins, the Atlantic salmon, have shown a larger percentage of growth. Many of the California salmon are from twelve to fifteen inches long. One, in the early part of last October, about the average size, being found dead in the pond, was opened, and in the ovaries were found over 200 eggs of nearly full size. But the work to secure white fish and lake trout spawn was so protracted and tedious as to preclude the possibility of doing much else. The land-locked salmon of the hatch of 1876 are not developing as it was believed they would, their growth being unexpectedly gradual. They however have been placed at a disadvantage, being confined in a somewhat limited preserve, and with a limited supply of fresh water, while their salt water congeners, the *Salmo Quinnat*, of the hatch of the same season, have occupied the large spring ponds, with an abundance of water, and consequently have waxed much more fat and sizable than have the members of the Schoodic family.

Passing over that portion of the Report which refers to the proceedings of 1875, we turn our attention more particularly to what was done during last year, although in giving figures as to fry deposited the work of both years is included. Of California salmon the Commissioner received 800,000 eggs, which were hatched with but small percentage of loss, and distributed in lots in no less than sixty-eight different bodies of water. In addition to this quantity, the St. Josephs river was further enriched by 33,000 fry of the same hatch which were intended for Illinois, but having reached the Pokagon hatchery in a suffering condition, were by order of Professor Milner turned into that river.

Eighteen thousand eggs of the Schoodic or land-locked salmon were received in March, 1876, at Niles, from the Bucksport (Maine) establishment, and after being hatched were deposited in various lakes and ponds.

As might be expected, the great work of the Commission was in connection with white fish, which, it is claimed, exceeds in extent the work of any fish State, and is unparalleled in age or country. The immease number of nearly *ten millions* of white fish (one million being equivalent to the hatch of many millions of other varieties of fish) were hatched and distributed. The hatching was done at Detroit, and with the water of the city water works, it having been found that the waters of the Detroit river, notwithstanding their occasional turbid condition, would be as suitable for the artificial hatching of the ova as the iced spring water previously used. A lengthened description of the taking of the ova is given, together with tables showing the condition of the weather during the hatching. Four hundred and five female fish were stripped, and of the male fish, or milters, a considerably larger number, the impregnation being by what is called the dry process. The eggs were obtained almost exclusively at night, and on impregnation were placed in large cans, and early each morning taken by steamer to Detroit and placed in the hatching trays and boxes. The spawners averaged very large, weighing from five to eight pounds per fish. The process of incubation extends over a period of five months, during which time the eggs are carefully watched and tended. The first eggs hatched was on the 1st of March, and the last on the 11th of April, and at from eight to fifteen days old the fry were shipped for Deposit. Nearly six pages of the Report are devoted to enumerating the places of deposit and number of fish. This may be summarized as follows:

Total deposits in the inland lakes, 3,382,000; total deposits in Lake Erie, 450,000; total deposits in Lake Michigan, 1,000,000; total deposits in St. Clair river, 500,000; total deposits in the Detroit river, including the deposit in Rough river, which is a small tributary of the Detroit river, and therefore a virtual plant in the great river, 3,978,000.

The sum total of deposits, 9,310,000, to which should be added as a proper part of the grist of the Detroit factory, 600,000 eggs, in an advanced stage of incubation, donated to the Fish Commission of the State of Ohio, and 300,000 to the Commission of New York, thus aggregating, as will be seen, a grand total of 10,310,000. Of this total, however, 1,460,000 are a donation from Professor Baird, being part of a lot hatched under direction of the United States Commission at the Northville hatchery. Mr. Jerome justly gives great credit to his assistants in this tremenduous hatching, Messrs. Chase and Ramsdell.

With regard to other fish, the pickerel is given up as a sort of fresh water devil fish, and his extermination would be looked upon as a blessing. The grayling is a fish to which much interest is attached, and the problem as to whether their numbers are to be increased by artificial propagation will be solved at an early day. The black bass Mr. Jerome puts down as the King of fish, whose motto is "to live and let live," and who is unswayed by "intimidation" of any kind. This is what he says of him:—

"See, what are his universally conceded good qualities. He is among the gamiest of the gamy—his platter reputation suffers by comparison with none—his family government is just splendid—for the children born unto him he cherishes a tender care and affection, watching over and protecting them from the myriad dangers that lurk about their ova life, and which follow them through the weeks and months of tender infancy. He will live and thrive in lake or river—in high or low temperature, in fact almost equally well wherever dame fortune appoints his habitation. So instead of going to a remote east and a still remoter west for stock with which to populate our waters, why not be content with the rich native supply already sporting with unrivalled beauty and superiority in many a neighboring river and lake, indeed, almost beneath the very shadows of our roof trees.

But the worthy Superintendents affections are not undivided; even the slippery eel has a place in them, and he is satisfied that notwithstanding invidious comparison that the eel is the favorite fish with the people, and entitled to an honorable position in the industry of pisciculture. At the two hatcheries a statement of the stock on hand, shows that "there are now upon the trays of the Pokagon hatchery half a million or more of white fish ova, and about one million of salmon trout eggs. Upon the trays of the Detroit hatchery the Overseer, Mr. O. M. Chase, reports between eight and nine millions of white fish eggs. To carry these forward to March and April, the probable period of their incubation, will require the assiduous labors of the overseer and of his assistant, Mr. Wm. Hines, and a probable force of three or four pickers daily. So a large draft on the fish fund will necessarily be required to carry the present stock through; while bad water, bad weather, or ill-luck from an unforseen cause or causes will unavoidably enhance the volume of expenses. And then to the large expenses incurred for the hatching of such immense numbers of fish, there remains to be added the expenses of their deposit; and should the Commission deem it advisable to order them distributed largely into the interior lakes, the probability of any considerable overplus from the current year's appropriation would be at best but a remote one. The Superintendent sees but a faint glimmering of a chance for the grayling, black bass and eel, during the coming spring and summer, except that portion of the fish appropriation which reverted to the Treasury of the State be restored to the behoof and uses of the Commission.

The Report concludes with an expression of thanks to the various railroad companies for their kindness in transporting fish, and an Appendix containing game and fish laws, etc. If fish culture is to be looked upon as a science, the dryness which the general reader finds in scientific reports is entirely omitted in the one under discussion. Mr. Jerome has made it a most readable and cheerful *resume*. Another feature of the Michigan Commissioners Report is, that it comes to us bound with board covers, by which means it is much more easily preserved. We hope this plan will be adopted by the Commissioners of other States.

A Rejoinder to Fish Culturist Thompson, New Hope, Pa.—Our Nouvelle (Canada) correspondent refers in a recent letter to Mr. Thompson's strictures upon his statements that salmon will not live more than two years from the sea, and says:—

"Of course I meant *adult* salmon, and I don't think he can show me salmon (*Salmo Salar*) of 10 or 12 lbs. in good condition—in short, clean fish, that have spent two consecutive seasons after spawning in pure fresh water. At least I can vouch that the British salmon deteriorates the first year and dies after the second. The late Mr. Ashworth tried it at Galway with invariably the same results. However, I am open to conviction."

Natural History.

A WINTER VISITOR AT A FRONTIER FORT.

[Under date of Fort Sanders, Wyoming Territory, December 20th, 1876, Col. A. G. Brackett, United States Army, gives the following account of a woodpecker:—]

"We had a fearful snow storm in the Rocky Mountains on the night of the 26th and 27th of November, 1876. It snowed all night calmly and quietly, and in the morning lay a foot or eighteen inches deep all over the plain. A hairy woodpecker (*Picus villosus*), had been with us during the whole autumn, and the morning after the storm was as busy as ever getting worms out of the logs of which our post is constructed. Most of the houses are made of logs on which the bark still remains, and our woodpecker makes this bark fly off in the most approved style when he commences work upon them with his long, strong black bill.

Sometimes the Hairy woodpecker comes directly alongside of the window where I do my writing, and there—on a projecting building—works with all his might. Occasionally I see him run his long tongue into the hole he has made, or at least enlarged, and piercing a worm swallow it with the greatest satisfaction. He appears also to get something from under the bark of the logs, as he moves his bill rapidly as if chewing. He removes the bark and underneath it finds some kind of food; it may be the eggs of insects, or worms, which he eats with exceeding relish. His breast feathers are very fine, soft and downy, which gives him his name. I had supposed he always speared the worms with his hard and sharp tongue, and this may be the case ordinarily, but this morning he ate with his bill, as other birds eat, chewing rapidly. All of the time he is at work he seems to be eating, and the amount of food consumed by any considerable number of them must be enormous. All birds are vigorous eaters, their mission in life being apparently to eat a vast amount of all kind of food, and in this way they do much good or harm—perhaps this is about evenly balanced. While working they have a handsome appearance, particularly if the weather is cold, and their feathers are standing out. Their soft and downy plumage white on the breast, the feathers becoming darker and of a dun color as they approach the skin, is very handsome, the bird appearing to be surrounded with soft and warm plumage, especially adapted to this cold climate amid the Rocky Mountains.

So our woodpecker goes from house to house, and has become as well known at Fort Sanders as almost any individual in it. We are all surprised to see him remain so long after the cold weather has set in, and when the only birds we have remaining here are horned sky larks, or shore larks (*Eremophila alpestris*), which we call snow birds, who live here the whole year round and rear thousands of their young on the Laramie Plains. The other snow birds, that is to say, the Oregon snow birds (*Junco oregonus*), and Gray Crowned Finches (*Leucosticte tephrocotis*), have not yet put in an appearance. The Gray Crowned Finches are among the most beautiful birds in the mountains, their bright rose-colored sides, dark brown backs, and gray crowns, rendering them remarkably handsome. It is no wonder they are so highly prized in Alaska, where they remain during the summer months, and where their sprightly ways and bright coloring add so much to the landscapes, closed in as they usually are with tall, dark pine trees.

Our woodpecker has made quite a name for himself as a "spirit rapper," and some mornings, very early, has started several people out of their sleep by his quick and restless pounding, who thought that the spirits had come sure enough. When pounding on the outside of a house, the sounds made by the woodpecker are exactly like some of those said to be made by the spirits. Notwithstanding the weird ways of this solitary woodpecker he has made many friends for himself, and although several of the soldiers have tried to catch him he has eluded them all, and works away as unconcernedly as if nothing had happened. At times his rappings becomes so loud that we are obliged to drive him off, when he goes to the next building and begins work again.

I cannot understand why this bird alone of all his species should remain here, where it is exceedingly cold at times. He may have thought he found a good thing when he came into the fort and discovered that the logs were filled with the kind of worm he relished above all others; and perhaps he said to himself "Here I will remain until next spring, as I can find no better place should I travel way down into New Mexico or Chihuahua."

It is true enough that some wild ducks occasionally stay all winter in the head springs of the streams, where the water is open. Last winter I saw a large number in the head spring of City creek, about two miles above Laramie city. As I approached they scrambled out of the water to the dry land and there remained. As I did not wish to disturb them, I turned my horse and went back, leaving them huddled together near the spring. This proves that all of our ducks do not go away at the approach of winter, although most of them do. It would be strange indeed if some did not remain behind, either from necessity or choice.

The old logs are full of larvæ which the woodpeckers hunt for with great assiduity. I was surprised at first to see how many chips this woodpecker could make from the logs, pulling off pieces of bark half the size of my hand, and it was several days, during the last of the warm weather, before I could understand what caused so much bark to be lying about on the porches. At last I saw the red-head at work, who evidently "meant business." The common class of Mexican people call woodpeckers "carpinteros," or carpenters, from the way they make the chips fly after the manner of the carpenters. Harris's and the downy woodpecker are very much like the hairy woodpecker, and a man must be able to decide at once which is which, as in their wild states, their movements are very rapid.

In regard to the woodpeckers Mr. W. L. Baily in "Our Own Birds" says: "Although the red-heads undoubtedly do great service to the farmer in ridding his orchard and fruit trees of a great number of insects, yet we cannot conceal the fact that their indulging in a fondness for fruit and green corn has given them a reputation anything but enviable. The finest and ripest of the fruit is generally selected to gratify their desires; and so keen is their relish for the early productions of the orchard, that a well loaded cherry tree will sometimes be entirely stripped of its cherries before the owner has fairly tasted them."

Up here in the mountains we have very few either of cherry trees or woodpeckers, and welcome the latter whenever they make their appearance. We have few trees of any kind, and the fact that a woodpecker, of all birds in the world, has chosen to spend the winter with us has given us both surprise and pleasure. If we have good luck I will tell you how he spent the winter.

CLUPEA AND CORREGONUS.

VERGENNES, January 31st, 1877.

EDITOR FOREST AND STREAM:—

At the request of several members of the Ferrisburgh Sportsmen Club, I send you herewith a specimen of a fish caught in Lake Champlain through the ice. It was unknown, or at least so rarely seen as to attract no attention south of Split Rock until the winter of 1870, but is now quite common in the waters of the lake between Split Rock and Port Henry. It is only caught in January, February and March, through the ice. It being thus caught at the same season as our smelt, which we know are a salt water fish, leads us to conclude that this is also a migratory sea fish. Fishermen assure me that these fish are never caught in the same places at the same time. I find in Thompson's Vermont, which is the only work of reference I have, a fish whose description very nearly answers for this; he calls it the winter shad, *Hodon clodalus La Sueur*, Thompson's Vermont, A. D. 1842. Our fishermen call it indifferently blue fish, blue herring, ale-wife and herring.

Will you for the benefit of many readers of your valuable and entertaining paper, members of our Club, publish a correct description and the name, common and scientific, of the fish I send you, and whether or not it is a migratory sea fish? Yours sincerely, N. E. HALL,

Vice-Prest Ferrisburgh Sportsmen's Club.

Ans. The fish in question belongs to the genus *corregonus*, many varieties of which exist in the great lakes and lesser inland waters of America, the principal or best known being the white fish of commerce, or the *corregonus albus*. It is closely allied with the lake herring, *clupea harengus*, which it resembles at a casual glance, but upon near inspection it will be found that the lake herring lacks the adipose second dorsal fin which distinguishes this; that its scales are smaller, its color more greenish, and its tail more forked. The Salmo family is also distinguished by the adipose fin, and between it and the family of Gadidæ are several intermediate links, the species before us being one of them. It is about ten inches long, and having been some time out of the water has acquired a deep blue color like that of the salt water herring. This fish is not, strictly speaking, a cisco, though the difference is hardly appreciable. It is quite different from the ciscoes found in Geneva Lake, Wisconsin.

It may be well to say that while the adipose second dorsal fin is a generic characteristic of the Salmo family, and a specific characteristic of the genus *corregonus*, it is also found in the catfish tribe (*Saluridæ*) and in the smelt (*osmerus;*) therefore, the species are not determined by this fin alone.

THE BLACK DUCK IN THE ROCKY MOUNTAINS.

WASHINGTON, D. C., Jan. 27th, 1877.

EDITOR FOREST AND STREAM:—

In your note below Col. Brackett's list of the Birds of Wyoming, you state, referring to the black or dusky duck "(*Anas obscura*) for example, has never, we think, been noticed as far west as the Rocky Mountains before," etc. Please allow me to correct your statement, and refer you to a report made by myself and Mr. H. W. Henshaw, Feb. 15th, 1873, to Lieut. G. M. Wheeler, U. S. A., in charge of Explorations west of the 100th M. On page 31 you will find that I saw this species at Rush Lake, Utah, in Nov. of '72. At this time they were present in enormous numbers, and I have killed too many black ducks not to know them when I see them. H. C. YARROW.

[Dr. Yarrow has our thanks for his prompt correction of our error. The report referred to was not at hand at the time when the note referred to was written, but we have since been able to procure a copy.—ED.]

"DOES THE OSPREY EVER TAKE DEAD FISH?"

POTTSVILLE, Pa., Jan. 15th, 1877.

EDITOR FOREST AND STREAM:—

In your very valuable journal of the 11th inst., "Roamer," the Portland correspondent, briefly replies to the letter of "S. C. C." of December 7th, in which the latter tells of an "osprey picking up a dead fish." The former suggesting: "Did not the observer mistake a young eagle for an osprey?"

The habits of the osprey, or fish-hawk, having been fully and ably written up, I do not propose to discuss them, but, since the question is being agitated, I desire to relate a circumstance which occurred some years ago. I have always been extremely fond of fishing, and the farm on which I lived until recently was amply supplied with never-failing springs of pure sparkling cold-water, thus affording excellent facilities for building a fish pond. Having constructed one, it was immediately stocked with the choicest variety of fish with a view to their propagation. I had regular hours for feeding them, and after a time seemed to have won their affection, as they would all ascend to within a hair's breadth of the water's surface upon my whistling or depositing crumbs of bread in it. But a singular circumstance was that as rapidly as I would replenish the stock there was a hidden and unaccounted-for diminishing of the "pets." Their leaping over the breast of the dam was an evident impossibility. No snakes or terrapins could be found nor the foot-prints of any animal.

After vainly trying to discover the marauder by means of traps and snares, as well as by solitary watching by night, I began to believe that my forager was a bread daylight thief, and with a strong desire for its capture, I secreted myself behind a bush, gun in hand. It was a day in the middle of June. I never knew a summer morning more beautiful and still; only one little cloud was visible, and *that* seemed as pure and white and peaceful as if it were the smoke of some burning censer. The leaves hung silent in the woods, and the flowers were bending their heads as if dreaming of the dew, while the atmosphere was of a soft and luxurious sweetness. I had occasion to remain in position but a short time, when suddenly I was overshadowed by an immense fish-hawk. Hovering around and over the pond for a moment or two he descended with lightning-like rapidity into the water, emerging with his iron talons firmly clinched to one of my "speckled beauties." When he had reached an elevation of about fifteen feet above the water my finger touched the trigger. The fish fell; the hawk fluttered; but, upon regaining his equilibrium, apparently in fury and excitement he returned to the spot where the fish had fallen and picked it up. When he had reached about the same elevation I let drive the other barrel, and the thief fell a dead osprey.

DOM PEDRO.

EDITOR FOREST AND STREAM:—

Your correspondent from Portland is inclined to doubt that the osprey ever takes dead fish; thinks that I may have mistaken the young eagle for the osprey; and if the incident was correctly related; asks if it is not an unprecedented one. As to mistaking the species, I believe I am too familiar with them for that to occur, even were the distinctions between them less marked than they are. Neither is the instance unprecedented, since I have seen it happen before, and under similar circumstances. I have also seen the osprey neglect to pick up his dropped fish, as the books say he does; but I have never seen the eagle catch a fish for himself. Perhaps because in Florida there are plenty of fish-hawks to do it for him.

In the words of a recent practical writer on ornithology, "Birds, as probably other animals, are not quite so invariable in their habits as has been commonly supposed; hence one should not rashly question the accounts given by usually reliable authorities, because in particular instances they do not accord with their own observations."—Allen's Notes on Some of the Rarer Birds of Massachusetts.

Woodland, Farm and Garden.

BULBOUS PLANTS.

FEW classes of cultivated plants are so universally beautiful, or so much admired when in flower, as bulbs. They are almost without exception easily grown, and when well treated flower profusely; yet not unfrequently complaints are made that some of the most common varieties are shy bloomers, a circumstance doubtless attributable to some inattention on the part of the cultivator, rather than to any inherent deficit on the part of the plants themselves. Plants to bloom in perfection must be well grown and well ripened, and this is especially necessary in the case of bulbs. Nevertheless, nothing is more common than to see the pots containing this class of plants thrown carelessly beneath the greenhouse stage, or crowded on a shelf and left without moisture for days together. When such maltreatment is practiced we need not wonder at bulbous plants not blooming well the following season. As soon as the flowering season is over, all such plants require even redoubled attention, and if they are grown in quantity they should be all set together where they can be readily seen and carefully watered and syringed as required. There is no other class of plants that will better repay the painstaking cultivator than hardy, half hardy, and tender bulbs, carefully selected and well grown. Only give them positions equal to those occupied by Orchids, Palms, or Ferns, with half the amount of attention they require, and a perpetual exhibition can be had of the most gorgeously tinted flowers. It is frequently asserted that no plants rival the Orchids in delicate tinting and delightful fragrance, but even the graceful East Indian Butterfly Orchids, (*Phalænopsis*) with all their wealth of snowy blossoms, are not more beautiful or more deliciously fragrant than the chaste and pearly blossomed Eucharis. Place a plant of Masdevallia ignea or veitchii side by side with Hæmanthus coccineus, or even Valotta purpurea, or any of the richly colored Amaryllids, and ask any ordinary observer which is the brightest, freshest and most effective. Take a handful of Ixias or Sparaxis and carry them into the vapor bath of an East Indian Orchid house, and they will hold their own against the most rare and valuable of tropical epiphytes. Indeed, though seldom seen, *Ixias*, *Sparaxis*, *Babianus*, *Tritonias*, *Anatis*, etc., are invaluable for greenhouse culture, and furnish abundance of their lovely spikes of bloom for cut flowers. The Valotta purpurea also should not be neglected, an evergreen bulb which should never be allowed to dry off, or rest like the most of bulbs, but in our experience growing and flowering best when cramped for room, and fed liberally with liquid manure. Among the smaller bulbs adapted for pot culture may be named *Marcissi*, both yellow and white; *Crocuses*, *Snowdrops*, *Tritelias*, white and blue; *Hyacinths*, and *Tulips*, of course, and the *Guernsey*, and *Belladonna* Lilies, the latter of which we have seen planted out on a warm border flowering more freely every fall than if grown in pots, its delicate rosy pink blossom being borne on stout stems twelve to eighteen inches in height. Some varieties of *Gladiola* are also well adapted for pot culture, and as for *Lilies*, no plants are more popular at present, either for pot culture for the greenhouse, for cut flowers, or for the decoration of beds and borders in the flower garden or pleasure grounds.

MAIDEN'S HAIR FERNS.—Anyone having a plant of any of the Maiden's Hair Ferns (*Adiantum*) may easily increase it by division—that is, by taking it out of the pot, pulling it apart carefully, leaving a crown, and, if possible, a few

leaves to each piece, and planting them separately in pots in some nice compost composed principally of peat and sand. Thus treated, and placed in a warm, shady corner of the greenhouse, the plants will grow away freely. This is the time for such work indeed, for dividing up all such Ferns as *Nephrolepis, Onychium, Polypodium, Davrallia, Asplenum*, etc., and in fact all that propagate themselves in this manner, as the fronds are now in a quiescent state, and many of them just starting into growth. Another, and a very interesting way of increasing Ferns, is by means of their seeds or spores. If any have been disappointed with the result of their efforts in this direction heretofore, let them introduce a few pieces of peat, broken bricks, or porous sandstone on the beds or benches on which the plants stand, and allow the fronds to distribute their own seed, taking care not to disturb the surface, and their success will be certain.

EUPHORBIA JACQUINÆFLORA.—Few plants are so useful or ornamental in winter as this. Planted out in a warm, cosy corner of the greenhouse where it gets plenty of light and sunshine, it will throw out its long, willow-like shoots of glowing scarlet, the most charming of all floral wreaths, and the most useful for all loose, natural floral decorations. Take two or three spikes of this with a spike of Eucharis, bearing two or three flowers and a pearly bud or two, a spike or two of Cœlogyne cristata, or any of the lovely white orchids, or even a few white Camellias with their own leaves, and one or two nice fronds of Pteris tremula, or of Maiden's Hair Fern, and you have an arrangement than which nothing could be more simple, chaste, or striking, and which will give more pleasure than the most elaborately gotten up arrangement of mixed colors.

SELECTING LANDS IN FLORIDA.

PUTNAM, CL., January 23d, 1877.

EDITOR FOREST AND STREAM:—

I have so many enquiring about Florida by letter, I thought I would write you.

I think the best time to start from New England for Florida is not before the first of November. The deer and wild turkeys are then in good order, and not as shy as they will be later in the season. The ducks and northern birds do not put in appearance much before the first of December, and are abundant from that time until the first of April. In purchasing lands in view of building or raising fruit, be particular about a healthy locality, and select at a distance from the hammocks or swamps. Secure rich, wooded pine lands, rolling or high; they are to be had if one is not too hasty to decide and will look around. Do not buy an old worn out homestead, but get dark soiled, rich pine lands abounding in large trees. You will need the trees for lumber and fencing. Do not burn up the waste wood, but pile it up to rot, setting out your orange, lemon, and fig trees, around the piles of rotting, moulding lumber. It is the best thing in the world for bananas and all kinds of fruit trees. I speak from experience. I own a large orange grove. It is well to have a small piece of high hammock on your land, for you sometimes need some muck around different kinds of vines. But be careful your place is not near any cypress swamp, for it is said it one sleeps where he can see the limb of a cypress tree, it is the finger of Death to him. GEORGE F. WILLIS.

In Ventura county there are a large number of ranches ranging from 7,000 to 90,000 acres, which are assessed all the way from $1.50 to $6 an acre. Fifteen of these embrace 272,000 acres, and they contributed last year toward the support of Government less than $1,200. Divide these 272,000 acres into 100 acre farms, and the county would have, instead of a score or so of nomadic herdsmen, 2,720 families, who would contribute to the support of schools, churches, roads and public institutions in a hundred-fold ratio, and the same land, under generous cultivation and improvement would yield a handsome revenue to the State and General Government. Santa Barbara county has made rapid progress in the direction of inhabiting these waste places, as has also Kern county, with her Central California Colony.—*San Francisco Bulletin.*

At Riverside, San Bernardino county, California, they have 28 miles of irrigating canal, which waters 20,000 to 25,000 acres of land. This land, without irrigation, would be worthless, not worth settling on; but with irrigation it is valued (very low, too) at $50 an acre, its products selling each year for more than the market price of the land. The locality has a water supply of 50,000 acres. California has many valleys quite as well situated as Riverside, but it takes time to prove what may be done with land and water, and most of them yet remain in the rough, unimproved and unsettled. A few such experiments as that at Riverside (where, as we understand, the canals were mainly dug without capital and on the coöperative plan) will explain the feasibility of like works in many other parts of the State, and open the way to thousands of prosperous farmers, and other thousands of day laborers. —*Rural Press.*

Every one who is at all acquainted with the habits of the skunk, knows that it is an invetcrate mouser as well as destroyer of other pests to agriculture; that it does not lie inactive during winter, but searches over the fields for its prey, which seldom escapes—as, being a digger as well as a hunter, it possesses great advantages over other enemies of mice. I have been in the habit of observing the faces of the skunk, as well as of other animals, and find that the diet of the skunk is composed of mice, crickets, grasshoppers, bugs, larvæ, etc.; in fact, we may say that its food is composed entirely of foes to the interests of the farmer. I think it would be a wise policy to protect skunks by legislative enactment for a few years, when, the facts becoming known, they would not need legal protection. The farmer's wife holds the skunk in abhorrence and dread as a poultry thief, but my observation and experience show that this fault of our friend is greatly exaggerated. My own loss in 12 years is very small, and if proper precautions are taken there need be no loss of poultry by skunks.—*Practical Farmer.*

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

N. B.—One of our New England correspondents asks for "a sharp and safe cure for Worms in Dogs." We wish him success.

E. S. G., Waltonian Club, New Haven.—Have mailed you the documents desired.

EDWIN OLIVER, formerly of Little Falls, N. Y., is requested to send his address to D. H. Eaton, of Peotone, Illinois.

T. H. H., Sheator, Ill.—Will you please give me your opinion on boring the chamber of a 12 bore gun to fit a 10 shell? Ans. It would not answer.

F. K. G., Jr., Norton, Conn.—Can bear all about the Dexter breech-loader and buy one by addressing B. M. Smith, Nelle's Corner's, Ontario, Canada.

GODONIA, Philadelphia.—Please send your real name and address to Thos. Williamson, Leesburg, Virginia. We have mislaid it. He wishes to talk with you about bass flies.

HALL, Vergennes, Vt.—What is the best work on Ichthyology for this section which would be within the reach of those of moderate means? Ans. Buy Prof. Gill's Fishes of New England.

S. S. P., Bridgeport, Conn.—I have a lemon and white pointer dog, imported in utero. Would the same be classified at a bench show as an imported or American bred? Ans. As imported.

C. E. W., North Milford, Maine.—What can I get for a live caribou delivered in New York or Philadelphia? Also what is the price for live red deer? Ans. The Dealers in animals will pay $40 for caribou. There is no market at present for live deer. Usual price is $10 to $15.

A. MCCURDY, Dansville, N. Y.—Having captured a white-headed or bald eagle, I desire to dispose of it. What is its value? Where can it be disposed of? Five quills missing from one wing. Ans. Address Chas. Reiche & Bro., animal dealers 55 Cnatham street. See advertisement in this paper.

JOHN COLFAX, Highland, N. Y.—Please inform me where can I procure central-fire metallic cartridges of .32 calibre, if such are manufactured? Ans. The Winchester Arms Co. makes a .32 central-fire cartridge, we know, but we are not sure whether the U. M. C. Co., do or not. You can obtain them at retail from H. C. Squires, No. 1 Courtland street, this city.

BADGER, Berlin, Wis.—Where can I purchase a telescope for a rifle? Do you know of any second hand for a 24 inch barrel? Is there any Western manufactory? Ans. Your can obtain telescopic sights for rifles from almost any first class dealer in opticians goods. They are so little used, however, that no one, to our knowledge, makes a specialty of them.

J. J. MCC., Natchitoches, La.—Please tell me what portion of Florida is best for raising vegetables? Do you know a small place of 200 or 300 acres, or less, for sale, near a railroad and good market? Ans. We have mailed you a reply, and also turned your letter over to Col. J. B. Oliver, of the Florida Land Agency, 21 Park Row, who will also answer your other queries.

V. P., New York.—Will you please inform me what part of Illinois, or near Chicago, is the best for shooting, also the variety of game to be found? You may include the State of Ohio. Is February a goood month for such sport? if not please name one? Ans. At Calumet, near Chicago, you will probably get some duck and snipe shooting in February or March.

W. S., Rouse's Point, N. Y.—Would you inform me what to give my spaniel, he has the distemper, and he seems hungry; what will I feed him? He runs at the eyes and nose and kind of slobbers at the mouth, and breathes quite bad? Ans. Give your dog 15 grs. calomel, placing the dry powder on the back of the tongue. Give 5 grs. of quinine twice a day, keeping the bowels moved, if necessary, with small doses of calomel.

J. D. H., New York.—Will you be kind enough to give me the pedigree of Mr. Tappen's dog Brisk? Ans. Brisk was by Major Belknap's Captain, (born on H. M. Frigate, Barracouta, off Cape Horn) out of his Fanny. Captain was by Plauto out of Josie, bred in Ireland by Capt. Anderson. Fanny was by King out of Betty, bred by Squire Pelfrey of Dublin. You can see this pedigree extended in our Kennel Register by calling at our office.

J. C. M., Mason City.—What is the best point for hunting and trapping in Montana, and about the cost for one season, starting from Mason City? Would'nt $300 be plenty for three? we have our guns. Ans. Go to Fort Benton by steamboat up the Missouri river, or by Pacific Railroad and stage. The best trapping grounds lies about 150 miles south and southwest, of Fort Benton. We cannot estimate the cost. Should think $300 would be quite sufficient for three experience trappers or woodsmen. It would not pay for the return trip, however.

C. E. B., Bloomfield, N. J.—1. Where can I get good duck shooting about the first of March, on Long Island or New Jersey shores, for about two weeks? What would be a comfortable house to stay at, and to whom should I write to engage a room, boat, &c? 2. Can you tell me of some person or firm who would bind my FOREST AND STREAMS for me, do it well? Ans. 1. Probably at Good Ground, Long Island. Write to Wm. Lane. 2. We can have your papers bound for you.

R. M. L., Scranton, Pa.—1. Is the pointer bitch Teal of the large size? Has she been broken, and a retriever? What is her color? 2. What is Lady Ti's color? Will she also retrieve? Ans. 1. Teal would probably come in the small class, but Young Baug, to whom see has been bred, weighs 55 pounds. She is liver and white and has never been broken. 2. Lady Ti is white and lemon. As dogs in England are not broken to to retrieve, (that is, setters and pointers) we presume that she is not.

J. J. Q., Pittsburg, Pa.—From the symptoms you give and which are too lengthy to print, your pointer bitch is troubled with worms. Give her 60 grains powdered Areca nut in three doses of 20 grains each two hours apart; four hours after the last dose give her one ounce castor oil. If you can not get the Areca nut at your drug stores write to Holberton & Beemer, No. 102 Nassau street, this city, who will send it to you prepared in proper doses.

D. L. D., Philadelphia.—The writer would like you to post him as to the proper manner in which to break a setter pup before breaking him in the field next fall. The pup is now six weeks old and comes from pure Irish (imported) stock. If there is any published relative to the subject, will you kindly give address? Ans. Do not commence to break your pup until he is at least six months old. Buy "Dinks, Mayhew & Hutchinson," in which work you will find full instructions. We can send it; price $3.

R. L. W., Mansfield, P.—Can Ely's wire cartridges and buckshot be shot out of a choke or modified choke-bore gun, and with good pattern and penetration? I see in the papers that some say it can be done, while others say it cannot without injuring the gun. Can a muzzle-loader be choked-bored? Ans. Buckshot can be used in choke-bored gun providing they chamber in the muzzle. We should not advise using Ely's wire cartridges A muzzle-loader can be choked-bored if it is not too much worn at the muzzle. The gun you allude to has been sold.

SPORTSMAN, Cleveland, O.—Were the cases and their contents exhibited at the Centennial by Purdy, Lancaster, Rigby, Dougall, and the other prominent London gunmakers returned to England by their respective owners, or left on sale with gun dealers in this country? If left in America I should be glad to know where application for examination with a view to purchase should be made? Ans. The case of Messrs. W. & C. Scott & Sons, went to Messrs. Wm. Read & Sons, Boston. The Greener guns are all in the hands of H. C. Squires, No. 1 Courtland street, this city. The guns of other makers we think were all returned to England.

SPORTSMAN, Canton.—Will you please state the provisions of the game laws of this State, and if you think best suggest some means of remedying the slaughter of deer? Ans. Although the law says "No persons shall kill or chase any moose or wild deer in any part of the State, save only and during the months of September, October, and November." Yet it is practically extended through December and January, by the very next sentence, which permits any person "to sell, expose for sale, transport, or have in his or her possession, moose, wild deer or fresh venison, during the month of September, October, November, December and January." The penalty is $50.

J. W. K., Ayer.—1. Do you think it makes any difference whether the eyes and nose of a setter dog are light or dark, or in other words, which do you consider the most reliable? 2 In picking out a pup at the age of eight weeks old, what are the principal points? Ans. 1. Yes, black nose and eyes are distinguishing marks of high breeding, besides adding much to the beauty of the dog. 2. Color and markings generally come first in choosing a puppy. The strongest and healthiest is perceived at a glance, and the chest, legs, loins, hips, and hind-quarters, should be examined, and the shape of the head looked to. It is difficult to give a rule for selecting a puppy; the eye must be the judge, and sometimes the runt of a litter turns out the best.

READER, Buffalo.—In your issue of July 6th, I notice an article by Wm. H. Rollins, Boston, on the subject of "Canvas Canoes." He says he "will write directions and give measurements so any of your readers can make one." I have written him but can get no answer. Can you tell me where I can get the photographs of the boats he mentions, and directions for making the same? or are there any makers of canvas canoe shaped boats? Ans. We are not personally acquainted with Mr. Rollins and do not know his address, but you may obtain it by writing to John H. Treat, Lawrence, Mass. One of Colvin's canvas canoes can be bought by addressing Holberton & Beemer, 102 Nassau street, this city. They are made in Troy, we believe.

W. F. R., Covington, Ky.—1. What part of Colorado can I settle on under the Homestead Law for general farming, such as would raise corn and wheat? 2. Will the country around La Porte, Col., answer the above requirements? 3. Is game plentiful around La Porte? Ans. 1. There is little "general" farming in Colorado. Corn and wheat are not natural crops there, and crops are dependant largely upon civilization, which is usually a co-operative enterprise of several farmers. 2. La Porte is on a stream. The same stream at Greeley is largely used for irrigation. 3. There are antelope about La Porte, waterfowl in season, and large game west among the mountains. For hunting and "ranching" combined, go into the parks, and adopt grazing, the most profitable farming in Colorado.

TRAPPER, Belleville, Canada.—Canada seems to be on the decline for fur, and as I see in your Trapping Department favorable report from Mississippi and other States in the Southwest, can you tell me anything about Arkansas? I have heard that it was a good ground for fur and not hunted at all. Is it too late to go there, and how shall I reach it? What part of the State shall I go to? Ans. The country watered by the St. Francis river and its tributaries is an almost unbroken swamp, notably the counties of Crittenden, Green, Craighead and Mississippi, and abounds in bears, panthers, wild cats, wolves, deer, beaver, otter, mink, coon, opossums, etc. It is sparsely settled and but little known. Take Memphis and Little Rock R. R. to Forest City; thence wagon 75 miles, more or less, as far as you wish to go. Trapping is done until April. There is no better field for trapping and hunting in the Southwest.

LAURANT, Philadelphia.—Will you please give me the name and color for flies, for perch and bass fishing? Ans. The Ferguson, Williamson, Academy, and Page flies are the best known, and constitute a variety of styles and colors sufficient to cover all waters. The Ferguson flies are generally very gaudy, with wings or bodies of brilliant crimson, gold, and green. The Williamson and Academy flies are less showy, with a more liberal combination of turkey browns and grays. The Page fly has broad scarlet ibis wings with guinea fowl scapulars. The Ferguson and Williamson wings are not flat, but in shape resemble the majority of trout fly patterns. We do not put as great faith in scarlets as some anglers do, except for spoon dressing. Flies should be small, except for very rough water. Duns and grey colors suit southern waters best; bright colors for northern waters. There are no distinctive perch flies, as those fish rise readily to bass flies.

R. S. P., New York.—1. Would I find any shooting in the vicinity of New York on Washington's birthday, and would there be any duck shooting at Jamaica, Rockaway, or surroundings? 2. Would not orange and sugar cane be a paying plantation in Florida? Where are the best grounds? Are there any near Homosassa? What is the fare to that place, and what could land be purchased for? Ans. 1. Depends entirely upon the weather. If the warm weather continues there will be, no doubt. 2. There is a fine abandoned sugar plantation three miles from Homosassa, on the river, which could be bought. Sugar and syrup, the latter especially, pay well. Most parts of Florida are well adapted to its culture, especially on the interior south of Palatka, and on the Gulf. Syrup will soon become a popular staple, and the earliest produces will find the best market. The fare to Homosassa is about $35 from New York by cheapest route, via Fernandina and Cedar Keys. Improved land can be bought for a few dollars, and wild land for about nothing.

W. H. S., Philadelphia.—1. I have a Scott choke-bore breech-loader, and in trying it at six targets yesterday at 40 yards with 3 drs. of powder and 1¼ oz. of No. 6 shot, found it to average 96 pellets. I had three pink edge wads on powder and 1 oz. shot; have seen the gun do a great deal better, and would like to know whether I had it loaded properly, as that is a very poor target; the gun is 12 bore, cost $200? 2. Please tell me the way to load shells to get the best patterns, and does it makes any difference whether the inside of metal shells are cleaned or not? 3 Does 40 yards range mean 40 yards from where you stand; or from the end of the barrels? and do they clean the barrels after each shot? Ans. 1 Your pattern is certainly a very poor one. You do not give the weight of your gun, but we should suggest 3¼ drs. powder and 1¼ oz. shot with only two pink edge wads over powder. 2. You must learn this by experiment as guns differ greatly. We prefer to have the inside of metal shells cleaned. 3. From where you stand, and the cleaning of the gun is optional.

A. J. A., Manatee, Florida.—1. I have lost a valuable pointer by a disease, called in this locality, "staggers," which affects both dogs and horses? 2. My horses, Gordon setter, and English pointer, all recent importations, are seriously annoyed by ticks upon which insect powder seems to have no effect. 3. I have lost one young and valuable mare from becoming "sanded" i. e., eating sand with grass or forage, causing inflammation of bowels, and subsequently death. What remedies or course of treatment would you advise in the three instances herein named? 4. Also what treatment would you recommend for botts in horses? 5. What is the correct amount of glauber salts for a dose when given as a purge for both dogs and horses? 6. Is there any better laxative for ordinary complaints of those animals? Ans. 1. This is due to indigestion, causing flow of blood of the brain. Treatment: for the dogs, cathartics, followed by tonics; for the horses, in the acute stage, venesection, followed by cathartics and easily assimilated food. 2. Take of quassia chips, one pound, soft water, four gallons, boil for twenty minutes, strain and wash animals with it. One application will be sufficient, if properly applied. 3. For a sanded animal, give from a pint to a quart of linseed oil, as a purgative, the dose regulated by the size of the animal. One dose, if it operates, will be sufficient. 4. For botts or worms use Gaing's Worm Powder, for which address Prof. J. A. Gaing, P. O. Box 938, New York city; price, $1 per box. 5. Glauber salts should not be given to dogs, as it acts as a drastic. Dose for a horse, from ten ounces to one pound. 6. There are several better laxatives, such as linseed oil, Barbadoes aloes in mild doses, &c.

—The name of B. T. Babbitt is synonymous with honesty and success, and his products are the very best in the market. His Toilet Soap ranks as the finest soap for toilet purposes in the world, being entirely free from poisonous elements, and the cheapest in use, as also the pleasantest for the skin that can be used.—ADV.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, FEBRUARY 8, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Editor and Business Manager.

INDEX TO VOLUME VII.—With this issue we commence Volume 8 of FOREST AND STREAM, and publish with it the index of the 26 numbers previous to date, which constitute Volume 7.

OUR GROWING CIRCULATION.—The new year opened most auspiciously for our journal, the subscriptions for the month of January, singly and in clubs, exceeding those of any preceding month. February is even better; so that we feel confident that our paper is not only high in favor, but that the prospects of an improvement in general business encourage its friends to subscribe more freely. Clubs of a dozen and upward cheer us almost every day. With the exception of New York, Pennsylvania is the banner State. Pittsburg is the banner town.

THE AQUARIUM.—Although the white whale is no more, the aquarium is still well supplied with novelties. The graceful and beautiful mermaid, Miss Lubin, daily gives her interesting performance under water. Our friend Fred Mather, the pisciculturist, recently returned from a trip to Currituck Sound, bringing with him a fine lot of black bass. Hamilton says the largest weighs seven pounds, and as what Hamilton says is very likely to be true, we won't dispute it. At all events they are the handsomest specimens of the *Perca nigricans* we have ever seen alive. Mr. Holder and party brought from the upper Hudson a few days since some fine striped bass and sturgeon. By-the-bye, while Mr. Mather was at Currituck he fell in with the Grand Duke Alexis and party, stopped at the same house with him, and for all we know has laid some deep scheme for the introduction of a new kind of cavaire into Russia. Aleck, he says, is a good fellow, a first-rate shot, and "takes sugar in his."

AN INVITATION.—We acknowledge with thanks an invitation from the Forester Club, of Janesville, Wis., to be present at their annual reception last evening. The Forester is the most flourishing organization of the kind in Wisconsin, numbering fifty members. All the State game laws of this and last winter's session of the Legislature were prepared by this club.

—The dial of the new Crystal Palace clock in London is 40 feet in diameter. The minute hand measures 19 feet. It travels four miles a week, but it don't compare with its great grandfather, Old Father Time, who travels 25,000 miles every 24 hours.

RAQUETTE FOR LADIES.

THE game of raquette described in FOREST AND STREAM a few weeks ago is eminently suitable as an amusement and exercise for women during the inclemency of winter weather. Though we strongly recommend out-door exercise, there are times of boisterous bluster when it is scarcely practicable. Attention must then be turned to in-door resources, and the raquette court has many advantages and endless attractions.

The game is already played, to a limited extent, by the ladies of this city. They may occasionally be seen in the courts of the New York Raquette Club, deftly handling the bat and retrieving the rebounding balls with creditable skill. It is a game which for many reasons is well worthy of the attention of the female sex.

It is, in the first place, a light game which demands skill rather than strength, and activity rather than hardihood. It develops the muscular power of the player without straining the nerves. The gracefulness of the game invests the player, and its great charm in this respect will, we do not hesitate to say, be most highly appreciated and most fully recognized when women players have attained the skill of the sterner sex. It is attended by no violence, either to the most sickly sentiment of the bug-bear propriety, or to the physique. It forms, in fact, a happy medium between the insipidity of croquet and the roughness of base ball. A question of the precision of these statements may possibly arise in the mind of the on-looker at a game played by men. The perspiring, flushed faces and heaving chests are hardly the accompaniments of an amusement in which women are recommended to engage. Let us have no weakness in looking at this matter. The flush of exercise is surely better than the pallor of indolence, and the heaving chest than the hacking cough.

We are perfectly willing, at the same time, to make concessions. We have heard of men making hard work out of a game of billiards. We might go further and ask, what woman has not either heard of or known men who were addicted to violence while engaged in the arduous toil of the toilet? They may, in fact, in whatever direction their attention is turned, make hard work out of exercise, and pleasure laborious. Ladies need not follow their example. Even should their taste run in that direction, *i. e.*, towards extremes, it is a tolerably safe assertion that half a dozen games of raquette would not be so fatiguing as the dances enumerated in one ball-room programme. And, further, how often in the ball-room are the most wonderful creations of the hair-dresser destroyed? How often does the heightened color set at defiance the milk-and-water law of maudlin fashion? But setting such matters aside, the game could, we presume, be shortened to suit women, should such a course be deemed advisable, or otherwise modified to make its mildness as an exercise, when played in reason, yet more mild.

It will be apparent to those who have any acquaintance with the game that it cannot very well be played by a lady "got up" for making calls, or with a sweeping train dragging its slow length behind her. The appendages of fashion are sad obstructions to agility. A special fashion for raquette could easily be devised. The gentlemen's rule is a very simple one, *viz.*, dispense with everything unnecessary. Ladies might imitate them at a distance. A very pretty costume, which would satisfy all the requirements of the situation, should not be beyond the inventive genius of an average *modiste*. It would only be necessary to bear in mind that the chief end in view is the unimpeded use of the limbs. The luxury of wearing for a few hours a costume in which hand and foot were equally free would lend a new attraction to the game.

GAME PROTECTION.

NEW YORK.—In union is strength, is a well-known aphorism that none will be inclined to dispute, but that in diversity of interests may oftentimes be found the greatest good for the greatest number, is also a truism upon which we need not dilate. A healthy emulation leads to great achievements, when a lack of the spur of excitement results only in careless inactivity. We are led to these brief, but we believe pertinent reflections, by observing in the Yonkers *Gazette* of two successive weeks, the action of the two Sportsmen's Clubs existing in that lively city. Both of these Clubs have been in existence about two years, and were brought into being barely through the energy of Dr. Charles W. Torrey, who seems not to have lost any of his vim through his incarceration since then in a South American dungeon. The original "Yonkers Sportsmen's Club" split upon the rock of pigeon-shooting, and the "Yonkers Game and Fish Protection Society" was the vigorous offspring. The Hon. Joseph Master, ex-Mayor of of Yonkers, presides over the destinies of those sporting gentlemen who are quick on the trigger and eager on the trail, while Dr. Torrey, assisted by an Executive Committee of prominent citizens, conducts the more quiet deliberations of those who believe that there is more of cruelty than of sport in trap-shooting. The gentlemen, believing with Isaac Walton that,

> Peace, and a secure mind,
> Which all men seek, we only find,

have been taking measures to stock the new and commodious reservoir, and the subsidiary creek which furnishes the water supply for the city with brook and salmon trout. The eggs are to be obtained from the State, and hatched out in the piscatorial establishment of Alderman Morse, the Vice-President of the Society, and within a few years we can hope to see the contemplative angler gaining health and recreation in the grassy shades and murmuring waters of old Westchester.

This action seems to have produced the spirit of emulation we referred to, and resolutions were adopted at the last meeting of the parent Club, authorizing an appropriation for stocking the county with quail, and urging the member of Assembly from the district to aid in amending the game laws of the State regarding the shooting of woodcock before September 1st.

Both Clubs are desirous of having a law passed preventing the raking or dredging for oysters in the waters of the Hudson, until such time as the oyster beds may recover from the bad treatment they have received. This is a matter, as we have before had occasion to observe, which should obtain the attention of the New York Sportsmen's Association, inasmuch as weakfish and striped bass, formerly plentiful in our noble river, feed largely on the spawn of the oyster, and are becoming scarce from the increasing destruction of their food. Westchester county has a law protecting its water front in certain months, and from all except resident oystermen, but the newly annexed portion of the City of New York is without any protection. There is need along the whole river front of a prohibitory law for at least five years.

SLAUGHTERING DEER.—There is no time more favorable for the destruction of deer than during a deep snow, when the animal breaks through the light crust and labors heavily to escape from his pursuers, who, mounted on snow shoes easily overtakes his victim. The following extract from a letter written from Russell, St. Lawrence county, on January 29th, shows how the law is being violated with impunity in that section .—

Mr. Wright has just come down from Cranberry Lake and informs me that Mr. Irish and Mr. Thomas' people, also Chas. Gotham and Clark Goodale, are slaughtering deer fearfully. They run them down by using snow shoes. Geo. Sawyer has killed about ten at Clifton. It is simply downright murder, and if there is any law it ought to be put in force. We all like the taste of venison, but like to have it a little more legitimate. If anything can be done to stop it *do it*, and push these fellows. They will keep it up as long as the deep snow lasts. Yours truly,

J. R. S.

—The Yonkers Sportsmen's Club have secured their first instalment of 144 live quail from Ohio. They are all hardy birds, arrived in good condition, and are temporarily housed in a barn, where they are being fed. When the frost breaks up they will be distributed, and with proper precaution do much to increase the stock of birds in Westchester county.

PENNSYLVANIA.—Sportsmen of this State are agitated over a bill which it is proposed to introduce into the Legislature, the provisions of which, some say, are to prevent the killing of quails for three years; while others whose fears cause them to magnify the evil, state that it is even suggested to stop all killing of game for a period of ten years. Such a law would be too absurd to be entertained seriously. We can make a suggestion to the Legislature which is far more practicable and sensible; that is, for them to appoint a Committee to visit Milford, say the 1st of August, and count the ruffed grouse (pheasants) that are shot out of season or snared in Pike county alone. They may then see the necessity of enforcing such laws as they have, before passing new ones.

CONNECTICUT—*Summer Shooting.*—A correspondent writes us from Lakeville, Litchfield county, Conn., Jan. 25th as follows:—

"I notice in the present issue of FOREST AND STREAM, a communication from 'Grumbler,' to a portion of which I must take exception. I agree with him fully as regards quail. Nov. 1st is plenty early to begin shooting them here. My experience was very similar to his the past fall, for on Oct. 20th we flushed a bevy that were not any larger than sparrows and scarcely able to fly. Regarding woodcock shooting, I must differ with him. I for one would be glad to see Sept. 1st the beginning of the open season for woodcock and ruffed grouse. There is certainly very little pleasure in sweltering in a woodcock swamp in July and August with the thermometer among the nineties, and mosquitoes nearly as large as the birds and far more numerous. As to there being no fall shooting in Fairfield county, I must confess that I can not understand it, for our hills are considerably colder and the birds stay with us until after the ground is frozen. Our best shooting is in the latter part of October, usually when the weather is simply perfection, and one shot at a strong full grown bird is enough to make a man ashamed of popping at the poor half fledged things of our summer shooting. Our birds don't leave us for Jersey as soon as they leave the corn fields, but stay about till the fall flight begins, (at least that is my experience); they sometimes take to what seems unusual ground, but if a man looks in the right place he will find them.

"There is at least one corner of Litchfield county where 'Grumbler' will find the advocates of summer shooting few and far between. I would rather shoot less birds for a few years at least and give them a chance to increase, than to kill extra birds each year for a few years and then have woodcock shooting a thing of the past. If the birds should become *too* plenty under the short season, I imagine it would not take long to thin them down again, should such a course be necessary. We are feeding the few quail that the heavy snows have left us, and propose to turn out a number of pairs in the spring.

"The trout hatched by the Salisbury Game Club are also doing nicely and will be placed in our depleted streams in the spring." PROTECTION.

VICKSBURG, Miss., Jan. 13th.

EDITOR FOREST AND STREAM:—

I have received the following letter from Princeton, Indiana, which I send you, with my answer thereto. If you see proper you may publish them. B. H. P.

"PRINCETON, Ind., Jan. 11th, 1877.

"Talk about your fishing up the Sandower, that you, Robinson and

Boswell have experienced. Why, you know nothing comparatively about fishing. Come up here if you want to catch fish. And instead of sitting in the broiling sun for hours without a nibble—but plenty of bites from mosquitoes—you can capture from three to four hundred pounds per day, *without manœuvre*, and the mercury ranging from four above zero down to zero. For the past week parties have gone to the Wabash and the slough making out near the railroad bridge, and cutting holes in the ice, have, with grab hooks, pulled out the finest bass, tin-mouths and other fish—some to the amount of five hundred pounds per day. They go, generally, in sleighs, and on my way up-town this morning I met three two-horse and several single sleighs, and one wagon starting out, each having large vessels, and some barrels to put their fish in.

"How will the above do for a *fish* statement? It is a fact, however. They generally cut the ice near a cluster of logs or brush near shore, where, perhaps, the water last froze and the fish assembled."

REPLY.

VICKSBURG, Jan. 13th, 1877.

DEAR —— I got your fish letter this morning, and read it, in convention assembled, in Boswell's office. The universal expression was that of disgust at the details, and surprise that a gentleman of you parts should make them without any expression of disapprobation. Robinson declared there would be about as much fun in hauling up dead cats, while it would be decidedly more respectable and humane. You have doubtless heard of pot-hunters—those awkward shots who sneak about in the brush till they find a covey of birds huddled together for protection from bad weather, and then blaze away with an infernal old "spill-out," murder the poor things by wholesale, and have the hardness of cheek and want of shame to boast of it afterwards. We all regard the pot hunter as a specimen of decency and prosperity as compared to a man who will jerk a grab hook into an unfortunate game fish, that is down with the frosts and unable to protect itself. We do not believe a genuine fisherman would be caught at such work. Indiana has wisely passed laws punishing as criminals those who capture fish with a seine. And seining is charitable and fair alongside of grabbing frozen fish through holes in the ice. In the former case the fish are presumed to be in good health and in the full possession of all their faculties. They have, at the worst, the chance of jumping over, or running over or around the blasted implement of destruction, but in the case you recite the things are down sick—torpid with the intense cold—utterly helpless—not even being blessed with the power of motion, and the only thing to alleviate in the least the cruelty of the transaction is the fact that their vision will not enable them to see their destroyers, and that their torpor perhaps deadens the pangs of the murderous grab. If the law of the State fines ten dollars for seining it should fine fifty dollars for this infamous grabbing. I have no patience with such fishing or such fishermen as you describe. B. H. P.

THOUGHTS FOR PRACTICAL MEN.

MODERN AND OLD TIME SPORTSMEN—OLD ABUSES WIPED OUT—PROSPECTS FOR GAME IN THE FUTURE—ARTIFICIAL PROPAGATION OF GAME—STATE AND NATIONAL AVIARIES AND BREEDING PARKS—SUGGESTIONS TO OUR STATE GAME ASSOCIATIONS.

DANSVILLE, N. Y., Feb. 3.

EDITOR FOREST AND STREAM:—

WHAT a good thing that the time has at last come when the Votaries of Rod and Gun are looked up to and respected, where fifty or even twenty-five years ago they were looked down upon by the so-called respectable people, and classed among the low and vulgar. Thirty years ago, Henry W. Herbert (Frank Forester) stood out alone as champion of American field sports, and nobly did he do his work. With a combination of tact, energy, perseverance and patience, he succeeded in bringing the beauties of the ennobling pursuits of forest and stream before the people in such a thorough, convincing way, that a change came over the public mind regarding this subject, and to-day nearly every Four Corners has its sportsman's club working in different ways to protect God's creatures from utter annihilation.

To-day you will find among those who love the cabin in the wilderness, the camp fire, the trusty gun and pliant rod, representatives of all professions, trades and occupations. There is, I confidently believe, implanted in the heart of every man by a wise Creator, a love for some certain branch of this wide field, which when followed tends to brighten and prolong life; and at this moment all over this broad land you will find ministers, statesmen, lawyers and poets, only waiting with lively anticipation for the time when, throwing aside every care and responsibility, they can hie away to favorite streams or woodland and take their fill of pure air, sweet rest, and exhilarating sport.

The misanthropes and frowners down of legitimate sport are fast dying out; and, thanks to the healthy tone and unceasing efforts of such journals as FOREST AND STREAM, the people now see that horse racing and prize fighting are not necessarily concomitants of it. Time was also when the dram bottle was as much a part of the gentleman sportsman's outfit as his wad-cutter. This is happily changing with rapid strides, and I am glad to see your journal denounces it, and publishes articles proving conclusively that in the field the dram drinker lacks the endurance and stay of him who confines his potations to the brook or spring.

In a word, all the abuses at one time attendant upon and going hand in hand with the sportsman of the last generation, are rapidly passing away. Some few lingering remnants of a corrupt and gross sportsmanship still remains, and yet I am confident that another decade will find them all swept away, and a pure healthy love for field sports existing. What a glorious thing it will be when, all abuses done away with, the healthy, happy pursuits of field, forest and stream, can be followed for their own sakes, and the joy they give!

Contrary to the belief indulged by some, that in a few years all the game and fish will be swept from the land, and our fields and forests become a quiet wilderness in which is heard no cheerful cry of "Bob White," no muffled drumming of ruffed grouse, or flip-flap of rising woodcock, our streams and rivers but a waste of waters untenanted by a solitary fin, I confidently believe that ten years from now will see game and fish much more plentiful. The increase of sportsmen and sportsmen's clubs, instead of tending to decrease the quantity of fin and feather in our land will have, and already has had, a contrary effect. Hardly a member of these associations but has some farmer friend (and a great many farmers are themselves members) who, through his influence can be made to protect what he once destroyed, or at least counted as naught. This is exemplified by what these gentlemen are doing all over the land this unprecedented hard winter for the preservation of these helpless creatures. Many a farmer is watching with interest his little flock of quail as they run to and fro among the poultry picking up their share which he has kindly thrown them, and saying to himself. "I don't begrudge the little they eat, for it preserves their lives, and its only from their increase that Cousin Charlie, when he visits me next fall can hope for any sport. Let them eat; and although the partridges (grouse) are budding my young orchard considerably, I shall find no fault, for the snow and ice has so covered up their natural food that I suppose the poor things can get nothing to eat." I tell you our hope lies in the farmer, and if FOREST AND STREAM laid on the table of every country house in the land, supplanting the trash which the boys bring home, the revolution which is surely coming would be but the work of months instead of years.

The artificial propagation of game should be made a point. Mr. Green has proven to the world practically that the science of pisciculture has been of incalculable benefit to this land, making waters once barren to be fruitful, and those already fruitful to double their fruitfulness. Why should not this be the case in regard to game? Why should we not have national and State aviaries, where non-migratory birds might be raised and distributed, furnishing quail and ruffed grouse at nominal figures to sportsmens' clubs.

It is with feelings of dismay that we look forward to next fall's shooting after this killing winter. None but the wealthiest of us can hope to fill our game bags, and that only by hundreds and thousands of miles of travel. Our brethren at the south are all right; their birds never get imprisoned under three feet of snow. I am writing in behalf of the north and northern sportsmen, and at this present moment sadly do they need sympathy. We hear on every side of bevies frozen in, of little stark attenuated bodies lying in and by the roadside, starved to death; of grouse trying to peck through the icy coating of the buds; and falling down through the lack of food. All these things forbode disaster to shooting next November; and to deprive us of our shooting is to take away what we live the other eleven months for. The accident which has happened this winter has happened other winters, and is very liable to happen again. No legislation can prevent it, and our experience in years past has been that a fierce snowy winter has invariably caused fearful diminution in feathered game. A disease constantly occurring will, at last, suggest a remedy, and the only remedy suggesting itself for this is the organization and maintainance of a State breeding house. The expense would not be great, and the good done would be beyond estimate. Supposing such an institution existed at present in New York State, with say five thousand pairs of quail and a thousand of pairs of ruffed grouse for distribution over our fields and through our forests? Sportsmens' clubs, instead of discussing the subject of what shall we shoot the coming season, would be making appropriations and otherwise preparing to send in their orders to the State Aviary for ten, twenty, or fifty pairs of birds, and with a sigh for those who met an untimely fate this winter, turn out the fresh, healthy quail, which increasing and multiplying would fill our rural districts with their plaintive calls next summer, and fill the stubbles with bevies in the coming fall.

Hardly a week passes without some one enquiring in your paper where live quail can be found for propagation, and the answer is invariably some point in the Carolinas or one of the Gulf States, and the price very high. Add to this the cost of transportation, and the limited supply, and it becomes evident that the importation of southern quail from private dealers will never become a great success.

If the State Association would take the matter in hand, and from their surplus wealth make appropriations sufficient to lease suitable grounds and buildings and procure a stock of birds, there is no doubt but that every Association in the State would enter in with them heart, hand and purse, paying certain dues for its support, and in a very short time our State Aviary would become a national blessing and a paying institution. All trouble regarding the effect of hard winters on game would be at an end. Bob White would whistle on every hill-side, and the ruffed grouse drum and plume himself on every log. Instead of leaving home a thousand miles behind to work our dogs successfully and count well on game, a day from business would insure a good day's sport. This is no fancy sketch; a calm consideration of the above will show to every thinking man, that a movement in the direction spoken of in this article is necessary. I believe it will be done, and that game will increase in much greater ratio that sportsmen, notwithstanding the fears entertained by some that the great additions to the fraternity during the last few years will effectually root out all the recognized game from the country. H. W. D. L.

—The numerous parties asking for live quail will find a lot advertised for sale in our columns to-day.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, Jan. 22d, 1877.

IT has sometimes occurred to me that in writing these letters I have given too much prominence to accidents in the hunting field, without drawing reasonable comparision between casualities arising from this and other causes. Probably an ordinary London fog is accountable for as many mishaps in the way of bodily injuries as the entire hunting season. Unfortunately, however, in the one case the injured person is likely to be some one of note, and there are not wanting persons who from being bitterly opposed to hunting, take every opportunity to parade such accidents as terrible examples to young men with a taste for following hounds. And it should be borne in mind that those who hunt are numbered by the thousand, and after all the the casualities are no greater in proportion to those engaged than could be compiled from the results of railway or steamship travel. Indeed, if the statement which is made in *Iron*, a journal which should be correct, is true, in the year 1875 there were no less than 765 railway employees killed in Great Britain and 3,618 injured. You cannot beat that in America, throwing the Ashtabula horror in.

It is most remarkable to a stranger the strong position which fox hunting holds in this country. The farmer suffers his hen roost to be robbed in silence, or looks with equanimity upon broken fences or trampled fields, all for the love of sport, or from a consciousness that he cannot help himself. It is true, however, that there is generally a hunt fund for the repairing of these damages, but in many instances it must be quite inadequate. A man who would shoot a fox is a vulpicide, and to poison a hound merits hanging. Occasionally, however, a rough customer is met with who runs wire through his hedges; and of all the things to work mischief, this is the worst. Neither horse or rider can often see it and a sure fall is the result. If you receive the *Sporting and Dramatic News* you will see in a late issue of that capital publication a very spirited and speaking sketch entitled "Ware Wire," which tells the whole story. Wire fencing has a most melancholy interest for me. Some years since while ranching in California I had occasion to fence in quite a large tract of land. Economy being an object, I hit upon a wire fence of five strands with solid posts and a single board on top. Lumber in sufficient quantity would have cost almost a King's ransom, and lack of water made a live hedge an impossibility. For a few weeks my fence looked well, but in an unlucky moment a *caviada* or band of mules strayed that way and with heads resting on the top board gazed pensively at the barley just showing above ground. Then one old dun colored fellow turned and kicked at the fence until he knocked the board off, and the whole band pressed and stumbled against the wire until it was level. In vain I drove them out and repaired the fence; bands of mustangs joined the mules and my wires were soon trailing in every direction over the plains. My crops were utterly distroyed and the only satisfaction I had from my fence was in providing luxurious pasturage for several hundred worthless brutes and in providing every ranchwoman within twenty miles with galvanized wire clothes lines.

A *bona fide* match has at last been made between O'Leary and Weston, and the articles are signed. The match, which is for £500 a side is to come off in some covered building within five miles of Charing Cross, from April 2d to 7th, the winner to be he who walks the greatest distance in 143¾ consecutive hours. Agricultural Hall is named as a likely place for the match, and it is to be hoped that both men will come to the scratch fit and well, when a most exciting race will be the result. Weston has had his way about the music, and bands are to play from 5 a. m. until midnight under the direction of each man during alternate hours, except while either is sleeping, when no music is to be allowed. No such match will have been walked since Capt. Barclay Allardice's great 1,000 miles in 1,000 hour's performance in June and July, 1809. It having been stated that the stakes in this match are the largest ever contended for, the *Field* gives the following instances when they have been exceeded:—

"In the autumn of 1800 Mr. Fletcher, of Ballingshoe, undertook to run 60 miles in 14 hours. Time was backed by Capt. Barclay Allardice, who just lost the stakes, amounting to £5,250. In December of the same year the Captain undertook to cover 90 miles in 21¼ hours, for a stake of £1,020, and had to pay forfeit to Mr. Fletcher, as he went wrong during his training. Stakes amounting to £4,020 were again contended for by Capt. Allardice in the spring of 1801, and he would have achieved the feat easily had not the umpire left the ground after he had run 67 miles out of the 90 in 13 hours, when he inadvertently took some bad brandy, and it was thought he would be unable to proceed. On Nov. 10, 1801, Capt. Allardice was at last successful, and ran 90 miles in 20h. 22min. 4sec., over a measured mile on the York and Hull road. Mr. Fletcher again backed time, and the stakes were the largest ever contended for in a genuine pedestrian contest in this or any other country, their amount reaching the unprecedented sum of £10,500. At Brighton races in 1807 Capt. Allardice won his great match with Abraham Wood, of Lancashire, the stakes being £1,050. Last of this quintette we come to his well-known 1,000 miles in 1,000 hours, for a stake of £2,100. In April, 1853, Capt. Lumley, of the 2d Life Guards, gave the Hon. T. H. G. Fermoy one mile start in a ten mile walk, but found himself overweighted. The actual stakes were £1,000, though announced as £200 only. Oddly enough Weston's present backer, Sir John Astley—then Col. Astley, of the Grenadier Guards—was umpire for Capt. Lumley; and W. Newman, of Camden Town (who finished fourth

in the great Agricultural Hall 24 hour's walking tournament last May) trained Mr. Fermoy. Many ladies of title and members of the aristocracy were present, and the match excited a deal of interest."

One of the most extensive and complete places of amusement in the world, the Alexandra Palace and Park, is advertised to be sold at auction on the 8th of February, under mortgage foreclosure. This immense establisment comprises 500 acres of land and cost the proprietors up wards of one million pounds sterling. The main building occupies an area of seven acres, and the Grand Hall has a capacity for seating 12,000 visitors. Then there is a Concert Hall with 3,500 seats, a Conservatory, Reading Room, Egyptian and Moorish Villas, and a Theatre with seats for 3,000. Bazaars, Picture Galleries and Dining Halls are also there. In the park there is a mile race course, with a trotting ring, a cricket ground of ten acres, Japanese village and a circus, and many more attractions and advantages too numerous to mention. If the late Geo. Robbins "of auction renown" was only still in the flesh, how he could have done justice to this sale.

I observe that a Pullman Drawing Room Train is now running daily between London and Brighton. I have not tried it yet, so cannot say whether the colored "porter," who seems as part and parcel of a Pullman, has been supplanted by a stiff English "guard." The attraction at Brighton is the Aquarium, which is now in most successful operation. But people, even if they go to the Aquarium, are not compelled to look at fishes alone; there is also something going on, a skating rink, or concert, or something of the kind. The lions at the Westminster Aquariums just now, are three Mississippi Alligators.

VAQUERO.

Rifle.

MILEY'S GALLERY.—A Tournament is now in Progress at this Brooklyn Gallery. The following are some of the best scores made since the tournament opened on Jan. 22d:—

Name.	Total.	Name.	Total.
Chas. H. Johr	46	J. W. Wallis	41
Col. B. E. Valentine	43	J. J. Teevan	41
T. J. McCabe	43	J. N. Brown	39
D. T. McQuillan	42	C. D. Eden	39
C. H. Holton	42	T. P. Pike	38
C. H. Johr	41		

The following made targets ranging from 35 to 38: J. F. Burns, Geo. Glendenning, Jas. Conners, E. R. Darveau, E. B. Ca-tner.

CANADA.—A match will be shot at Fisherville, Ont., today between the Amateur rifle team of that place and teams from Selkirk, Cheapside and North Cayuga (Ont.), a special prize to go to the best score. Distance 100 and, 200 yards.

THE DISTANCE AT WHICH GAME IS KILLED WITH THE RIFLE.

NEW ORLEANS, LA., Jan. 29th, 1877.

EDITOR FOREST AND STREAM:—

In the last number of your interesting paper is an article entitled "An Old Rifleman on Rifle Shooting," which contains some statements which call for a correction. The author—G. P. W.—is right in his remarks about the uselessness of the present long-range shooting, either for the hunter or the soldier. Firing at 1,000 yards, at a target, with a rifle with vernier sights, etc., may be a pleasant way to kill time, but it is utterly without use, as it neither fits a man to kill game, or to do his duty on the skirmish line.

I must find fault though with one statement of G. P. W. He says "one seldom shoots at a deer or turkey over 100 yards, and usually within 50 yards." Now had he qualified this by saying what kind of deer he referred to, and what part of the country he meant, it would have been all right. But as we have several kinds of deer, and also the whole United States is not comprised by Florida, to which he refers (as an example of his hunting), or the land of *Yankeeisms* from which his article is dated, I must emphatically deny this statement, as far as deer are concerned. In hunting on the plains and in the Rocky Mountain country—and the best big game hunting for rifle is west of the Missouri, and not east of the Alleghenies. I have found that 100 yards was a short range compared to most of the distances at which game is killed. I have hunted deer from the Wind River Mountains in northwestern Wyoming Territory to the extreme southwestern part of New Mexico, and my experience has been, that most of the deer I have shot myself, or seen shot by others, were killed over 100 yards, and many over 200 yards (measured, for always when I can, I pace off the distance). I refer more particularly to black-tail deer, as the white-tail deer keep more in the timber, or in the thickets along the stream bottoms, and are therefore shot generally at shorter distances. I mean the black-tail of the hunters in the Rocky Mountain country (*Cervis Macrotis*) called by naturalists the mule deer, and not *Cervis Columbianus*, the black tail of the naturalists, which is found farther west than the Rocky Mountains. (By the way, what impertinence and presumption on the part of eastern naturalists to try and dictate to us about the names of these deer, and to call the black-tail the mule deer, and the Columbia river deer the only true black-tail.) One of my rifles, which I used for hunting in the Far West, a Springfield, 50 cal. resighted, restocked, etc., by a western gunsmith, is so sighted that its point blank range is over 150 yards, as most of the game at which I used it, especially antelope, were shot from 150 to 300 yards. The farthest I ever killed an elk dead, was 400 yards (which I paced). I have seen many hunters on the plains have their rifles so sighted as to have a point blank of nearly 200 yards, thus making a very good rifle for antelope or elk. Elevating sights are an abomination and a delusion, on a hunting rifle. I have killed black-tail deer that were *twenty miles* from the nearest *timber*. You would have had a nice time crawling up to "within 50 yards" of them, Mr. G. P. W. I mentioned the foregoing facts so as to show you that your statement as applying to the whole United States (and there's nothing to show, in your article, that your statements are limited to any one part of the country), is a gross error, and liable to mislead a beginner.

As a general rule, it may be said that a rifle made in the east, is not fit for hunting on the plains till it has been resighted and made over generally in the west. The eastern makers are so stubborn and ignorant about the wants of the hunters, that there are a number of gunsmiths in the frontier towns who make considerable money by getting the rifles from the eastern factories and then resighting them, and fixing them so they can be used to kill game, instead of being ornamental guns, fit for little else than target shooting! The rifle shooting element of this country is to be found in the south and in the west. By rifle shooting I mean the legitimate use of the rifle, which is for killing game in hunting, or men in war, and not fancy Creedmoor target popping.

The New Englanders, as a people, have always been poor hands at rifle shooting. Bunker Hill was fought mostly with smooth bore ducking guns, and it was not till the Virginian "buck-tails" came up under Washington to the siege of Boston, that the rifle commenced to play an important part in the war. These Virginians were not only a terror to the British, on account of their fine shooting, but were a cause of wonder and also of jealousy to the Yankees. The Virginians were *hunters* and the Yankees *farmers*, and the ill-will which existed between the two sections (north and south) even as far back as that time, broke out into a fight, which, had it not been stopped by Washington at the outset, might have proved very fatal to the American cause. After the war was over, and the country was getting settled, and the game driven away, the rifle was used less and less in New England, until it became to the great mass of the people an unknown weapon. Not so in the south, for there it was the companion and friend of all. The hunter and the frontiersman depended on it, while the planter (who, like the English country gentleman, was used from his boyhood, to all kinds of manly field sports), used it for his pleasure. The consequence is, that in the Southern States the rifle is used, and well used for squirrel, turkey, deer, and bear hunting; though in the swampy parts of many of the Southern States the deer are run with hounds, and shot from "stands" on their "run-ways" with buck shot; yet often the rifle is used even then, and it takes *shooting* to hit a deer with a rifle going full speed amongst the live oaks. In the Far West, and in the Territories, the rifle of course is *the* weapon, many of the old hunters having the greatest contempt for a shot gun.

HOWCOLAH.

CALIFORNIA.—San Francisco claims to have the finest gallery in the world, the "Forest," kept by Hentz & Carson. The gallery is 175 feet long by 60 feet wide, divided into three ranges, viz., 200, 500, and 1,000 yards, the whole made so as to represent beautiful groves, with blue sky and green swards. Attached are parlors, reading and spectators' rooms. The rifles used are Remington .22 cal. Creedmoor rules are strictly carried out. The shooting done can hardly be excelled. For instance, Mr. E. P. Miners the other day in a match made 48, Mr. Frank Meagher, 47, Mr. J. H. Campbell and A. H. Hentz, 46, all off-hand, 200 yards reduced to 150 feet. Does that not compare favorably with the best on record? At 500 yards, 47 and 48 have frequently been made, till Mr. Hentz scored a full score, 50, or even better, had it not been for a defective cartridge, which gave him a 2 and 14 bullseyes in succession—72 out of a possible 75. The following are some of the scores made last Saturday for the weekly gallery medal:—

Name.	Total.	Name.	Total.
J. S. Campbell	45	Chas. L. Breton	43
John Robertson	44	J. Gallagher	43
E. H. Willet	44	Capt. R. H. Orton	43
Chas. Nash	43		

And no less than 20 competitors made 42. Should any team wish to shoot for the championship of the United State gallery shooting they can get accommodated.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.

CAPT. BOGARDUS IN CALIFORNIA.—A San Francisco correspondent of prominence, in whom we have every confidence, writes to us that Capt. Bogardus is having some trouble in his matches, and is out in an article in the *Chronicle*. He says:—

"I witnessed his shooting, and also heard some remarks, which I confess had the effect to turn my sympathies entirely in his favor. Californians claim that their quail are the most difficult birds in the world to shoot on the wing, and say that a man trained to shoot them can beat any eastern gunner, and they were bound to beat the gallant Captain by fair means or foul."

The record of Capt Bogardus throughout his professional career, both here and in England, has been that of such a "square" man that the fact of any misunderstanding whatever in his California matches somewhat surprised us. We observe that in one of his matches he challenged a bird on the ground of the shooter's gun being above his elbow, and the referee giving a verdict in his favor, his opponent left the ground and abandoned the match. In a "money" match he was perfectly justified in insisting upon a strict observance of the rules. As for the California quail being the most difficult bird in the world to kill on the wing, it is perfect nonsense. They are no more difficult to kill, if as much so, as our quail, and are usually killed in perfectly open ground, whereas a large proportion of our birds are killed in close cover.

CHOKE-BORED GUNS.

PART SECOND.

Greener urges that with his system and by regularity of boring he gets over uneven shooting, negativing the notion that such fault lies in the cartridge. Now this is attempting to prove too much; in his hurry to get every one to patronize St. Mary's Works to get an even shooting gun, he entirely ignores the effect which unequally loaded cartridges produce. Now there cannot be any question that there are some methods by which guns can be bored that betrays *less* the result of an improperly loaded cartridge, but still can never give anything like regularity unless care is taken in the loading. In allusion to the central shooting of the choke-bore, Mr. G. should have mentioned how it renders necessary a higher quality of filed barrels, which of course must be an advantage if only the encouragement of a better class of workmanship; four-fifths of the plain guns are entirely unfit for choke-bore through their being pulled together in the center to make them look better, but at the same time making them shoot out at forty yards from six to twelve inches. This I consider is one of the reasons that some in getting a gun choked are woefully disappointed in the execution of their gun after it has been done. A competent gunmaker should be able to tell whether a pair of barrels are good enough to introduce the choke with success, or else alter them to shoot straight. There are many guns which are much better without being choked from this cause alone. At page 129 Mr. G. gives what he considers the difference scientifically of the choke-bores performance and that of open bored guns; he urges that a contraction at the breech has much more tendency to jam or compress the shot than the same contraction at the muzzle, and this through the necessary displacement of the column of air in the barrel. Now this is in my estimation an error. This column of air business has acted too long as a "bogey" in the Greener family, and all based through some single experiment of a negative kind by Mr. W. Greener himself. To confute this, I ask anyone to make the following simple experiment: After the powder and shot has been loaded, put on lightly the top wad and witness the result after shooting. Not a mark gives evidence that no great obstacle or pressure has been exercised upon the top wad, and which it would be impossible to avoid did any great pressure as that suggested by Greener operate in the barrel. Take some more cartridges and put pressure with the loader of twenty-five to thirty pounds upon the top wad; take the wads of one or two and see how much they are marked and then fire the remainder, and little perceptible difference, if any, will be observed between the fired and unfired wads, showing that this column of air which has been doing such service in the gun trade for so many years is of a much more imaginable character than actual reality.

Mr. G. additionally says that the choke-bore throws more of the outside shots into the center., Now, I contend, that the effect produced upon the shot at the muzzle by the contraction, is just the same as that before produced in the old system at the breech, but at the muzzle it is at a more effective place, combined with the *additional* advantage of preventing the powder wads from disturbing the shot after its last cohesion, and here we have the element of advantage in the choke-bore. Let me firstly take the old system of boring, when by opening the breech the shot would necessarily occupy shorter length and greater in diameter than the barrel farther on; in its course of progress the compression which must ensue before the back part of the shot can overcome the inertia of the forward portion, and additionally the compression through the smaller portion of the barrel gave certain cohesive ability between pellet and pellet, which if not disturbed by a too heavy charge of powder which would unavoidably disintegrate it on leaving the muzzle, would proceed with fair closeness up to the target. The freeing at the muzzle was done knowing that, as portions of the shot if not in some cases all would partially separate to lead on to the target pellets which at the first moment of disintegration would be forced out to all sides. The results of this plan of boring are too well known to require comment. But let us now to the choke-bore. At the starting of the charge the same inertia has to be overcome, therefore its first cohesion assisted also by the barrel being a little smaller than inside of cartridge case. It must not be forgotten that all the difference in diameters is not lost in the shot being compressed to that extent, some of the difference of diameter being lost in the surface of the lead being abraded down; in other words, leading being the result. It now comes to the muzzle choke where its final compression takes place, the shot emerging as a cohesive mass of pellets. Let us trace the exit of the hindmost wadding; the force behind it has been powerful enough to force it with its charge of shot in front through the choke; it itself comes to the same obstruction, and is retarded in its exit more than in the old system; however slight, it is enough to afford the shot going onwards upon its own behalf. In vindication of this position, I would draw attention to the fact that two waddings between the powder and the shot in being a still greater barrier to its sudden exit after the shot, gives higher results upon the target. Now, again, Mr. G. puts forward that the advantage in using chilled shot is, that they suffer less change on the outside pellets, which in the case of soft shot are quite mis-shapen in their transit through the barrel, and carry up better in consequence to the target. I would like it to be understood that it is not all the outside pellets of the charge that are lost. Mr. Mortimer and myself instituted a series of experiments, and found that the front part, more particularly the outside of that is unaccounted for; indeed the target seems to receive that part of the shot which would in appearance represent a truncated or stumpy cone, the cone portion finishing halfway down the charge, and this seemed to be the case according to the density or lightness of the front wadding. Shots that fall before reaching the targets are largely composed of other pellets than those which form the outside of the charge, and one would judge from their appearance of compression that the superficies of shot next the powder wad through their cohesion with the same wad separate from the general body of shot. The outside pellets will in many cases be picked forty and fifty yards beyond the target; the specific gravity of wadding being less than shot, we can readily imagine how that the force imparted in the barrel to the front wad the instant it leaves the gun fails in momentum and operates as a retarding influence, and exercises an injurious effect upon the onward progress of the foremost pellets. So it is that it being indispensable to have a wad on top of shot to keep it in proper position in the cartridge, it is best to have it as light as possible, and which experience tells us is the case. It will be contended that as cohesion is thus an element in choke-bore, how is it that hard shot, less liable to cohesion, gives in some cases better results? It must not be forgotten that in chilled shot less deterioration of the outside pellet does take place, but still it has had to go through the choke; then the difference of diameter must almost totally have been lost in compressing the shot into its smallest diameter; and let anyone take the chilled shot after firing, and they will find that though hard, compression manifests itself on almost all the pellets, the foremost ones escaping almost scathless. It is upon this part of the subject and matters pertaining, that Mr. Greener could have expended more

labor, instead of which a matter of some fifty to sixty pages are all he dedicated out of a book which contains some two hundred and fifteen to that portion which we are most interested upon. Mr. G. puts it forward that he has fired more trial shots than any other six makers, and still to find that one so well suited to give exhaustive trials should give to the public a book with such meager results seems past comprehension. It would be well to notice that trial shots are not alone wanted so much as clearness of perception and observation at every change and result, which must necessarily ensue when such trials are going on, and judging from the book I am inclined to doubt this assumption on his part. D. KIRKWOOD.

TORONTO GUN CLUB.—At the last meeting of the Toronto Gun Club, held at their rooms Jan. 25th, the following gentlemen were duly elected officers for the current year: B. Moore, President; J. Taylor, Vice President, re-elected; J. Morrison, Secretary and Treasurer; Executive Committee, E. Perryman, W. Loudon, W. Bugg, A. McGregor; Auditors, G. Wright and R. Morrison; Taxidermist, Sam Herring.

The Kennel.

—Mr. S. B. Dilly, of Lake City, Minn., claims the name of Countess for his white and liver ticked pointer gyp, whelped Feb., 1876, by Shot out of Countess; Royal Fan for one similarly whelped Oct., 1875, by Ranger out of Dolly; Flirt for a liver and white gyp whelped Sept., 1876, by Ranger out of Fan, and Don for a white and liver ticked dog, whelped Nov., 1875, by Ranger out of Queen.

The above notice being addressed to our late Kennel Editor was overlooked by him.

—Mr. Ethan Allin, of Pomfret Center, Conn., writes us that his setter gyps, Chum and Cosey, have each whelped a litter of puppies by J. T. Brown's dog Boss, also bred by Mr. Allin. Chum had four dogs and two gyps, and Cosey three dogs and two bitches; all doing well.

—The Westminster Kennel Club's gyp Whisky, whelped on the 31st ult. seven puppies, all gyps, by Sensation. Three were black and white and four lemon and white. Five of them will be spayed and offered for sale at six weeks old.

—Passengers for the south will bear in mind that on the steamers of the Old Dominion Line they are allowed to carry one dog free of charge, and that if they have more the tariff is very light.

—And now they talk of having a Bench Show of Dogs in San Francisco, Cal.

—Mr. L. S. Smith's Field Trial setter bitch Dart, visited his Leicester January 20th.

"COUNTESS."—We have received the following letter from Mr. S. B. Dilly, of Lake City, Minn., owner of the fine pointer Ranger. Will Mr. Gillespie please notice?—

"In published list, Kennel Register, I see the name of Countess, liver and white pointer, owned by R. H. Gillespie, Stamford, Conn. I claimed that name for my white liver and ticked pointer bitch, whelped Feb., 1876, said claim being made in Chicago *Field*, Dec. 20th, 1876. Previous to that time the same name was sent to your paper, same as the *Field*, but failed, I doubt not from some good cause, to appear. If Mr. Gillespie will show prior claim to that name I will cheerfully surrender it; if not, I hope with due courtesy he will concede it to me. By inserting this in your paper you will greatly oblige a respector of nomenclature." S. B. DILLY.

DOG BOXES AND EXPRESS CHARGES.—A correspondent sends us the following communication on this subject:—

PHILADELPHIA, January 29th, 1877.

Not having seen in print the following device for the comfort of dogs shipped in boxes, I will give it for the benefit of those who do not know of it. It is simply to cut a round, or better, an oval hole in the lid of the box large enough for the dog to get his head out. It tends greatly to the dog's comfort and contentedness, besides making it more convenient for the Express Messenger to feed and water him. In regard to the extravagant rates charged by Express Companies for dog transportation, I am glad to see your patrons ventilating the subject.

For game shipped from the west, the charges, if paid upon arrival at destination, will be found to be *not less than* thirty-three per cent. more than if prepaid. This I have experienced in three instances. The explanation lies in the fact that the companies charge *local rates* over each express line that the shipment passes, instead of their *one through rate*.

It is a mean advantage to take of a consignee ignorant of the intricacies of the express system. The practice, if employed by any business house would, shortly swamp it. It shows that if a consignment be made to them without a prepaid agreement, that usurious interest will be charged for the confidence placed in them. The companies of course can defend themselves from the charge of imposition by tables of rates that cover every case, but the fault will remain the same whether their explanation be "special rate," "game rate," "through rate," or "local rate"; that to deposit game in Chicago, St. Louis, or other western city, with an Express Company, for shipment to the east without pre-paying, or contracting for the rate of the same, will cost whoever pays for it from one-third to two-fifths more than if prepaid or bargained for in advance.

B.

THE KENNEL STUD BOOK.

ST. LOUIS, Mo., February 1st, 1877.

EDITOR FOREST AND STREAM.—

The National American Kennel Club are about to take immediate steps towards publishing a Kennel Club Stud Book. I am aware that you have contemplated publishing a book of similar character, and have received pedigrees for registering in the proposed stud book. I know of nothing more suicidal to the best interests of fine bred dogs, or more unsatisfactory to the public who are interested in dogs, than the publication of two such books. I have no doubt that in the course of time the National Kennel Club Stud Book will be considered the authority, but the publication of two stud books would now only result in confusion and dissatisfaction. For harmony sake, let us rise above sectional jealousy, if there be any, and please remember that the sportsmen of the country take no interest in quarrels between the sporting papers, in Kennel Club Stud Books, or any other matters.

I think you will agree with me, that the sportsmen of the country require but one stud book, and that one should be recognized as authority by all. That being the case, I have the following proposition to make as a member of the Committee for the publication of the stud book for the National American Kennel Club. But please understand that what I propose is my individual plan, made without authority, but which I believe would be acceded to by the other members of the Committee. We propose to take the pedigrees you have received for registration, and treat them in the same manner that we do those published by the Chicago *Field*, *i. e.*, investigate their genuineness, and if found correct publish them in the Kennel Club Stud Book, and charge for such registration the sum of $1 for the first dog registered by any person or firm, and fifty cents for each additional dog registered by the same person or firm. If anybody has offered to publish the Kennel Club Stud Book and not charge for the registration of pedigrees, they have done so without any authority so far as my knowledge extends. Hoping that the above plan will meet with your approval, I am yours truly, E. C. STERLING,

Member Ex. Com. N. A. Kennel Club.

[We are glad to receive Mr. Sterling's letter. We have always said that when any responsible body or corporation would take hold of the publication of a general Kennel Stud Book, we would hand over the result of our labors to be incorporated with theirs. There appears, however, to be an insurmountable objection to the proposition which Mr. Sterling makes. When we first proposed establishing a Kennel Register we charged a fee of $1 for each pedigree registered. The object of this was to form the nucleus of a fund which would assist in paying the expenses attendant upon the publication of the book. Shortly afterwards the Chicago *Field* announced that the Kennel Club would publish a stud book, and that the pedigree to be entered in it would be received at that office and published without charge, the inference being that they would be published in the stud book free also. In this way doubtless many hundreds of pedigrees which would have otherwise come to this office went to the *Field*, and we were obliged to abandon the charge of a dollar for registration. The difficulty we see is this. Having agreed to receive and publish *in book form* these pedigrees *without any fee*, how can we turn them over to the National American Kennel Club to be published in their book, and expect the owners to pay that organization the fee demanded?

We have a proposition to make, however, than which nothing can be fairer. The N. A. K. C. desires a fee because they cannot risk a loss which might ensue from the publishing of the book. We will assume that risk ourselves, and the proposition which we have to make is that the National American Kennel Club turn over to us properly authenticated, all the pedigrees which have appeared in the Chicago *Field* (excepting those already in our possession), *and we will issue the stud book without charging any* REGISTRATION *fee whatever* The business of this corporation is not confined to publishing a newspaper; it is a Publishing Company, and our charter authorizes us to undertake any such work. As to those pedigrees now in hand, we will see that each one is correct before publication, and to this end we have accepted the kindly volunteered services of Mr. F. R Ryer, a gentleman who has made canine pedigrees a study, and who is thoroughly posted upon those of both foreign and domestic dogs. We would say to our readers that the publication of our Register has been deferred in anticipation of some arrangement by which but one would be published. If the N. A. K. C. accept our proposition we will commence work immediately.—ED.]

THE CEDAR RAPIDS BENCH SHOW.—A Bench Show of Dogs was held at Cedar Rapids, Iowa, from January 23d to 26th. Notwithstanding that it was the first ever held in this locality the show was a great success. The following is a list of the principal prize winners:—

CLASS 1.—Champion Class. For the best setter in the show of any breed, premium cup, value, $30. J. H. Whitman, Chicago, (red Irish setter, Ranger.)

CLASS 2.—Imported or native English English setters or their progeny (over 1 year old. *Dogs*.—1st, H. O. Bradley, Cedar Rapids, (Grouse); 2d, W. H. Brooks, Cedar Rapids, (Grouse); 3d, G. W. Kierstead, La Porte, Ind., (Bob). *Bitches*—1st, Wm. Wertzbaugh, Cedar Rapids, (Nelly); 2d, A. C. Taylor, Cedar Rapids, (Jessie); 3d, Green Butler, Cedar Rapids. (Fannie).

CLASS 3.—Imported or native Irish setters, or their progeny, over one year old, $5. *Dogs*—1st, J. H. Whitman's (Ranger); No 2 or 3. *Bitches*—J. H. Whitman's (Gypsie); 2d, Low & Vincent, Des Des Moines, Ia., (Gypsie); 3d, Geo. Waddington, Geneva, Ia., (Ruby).

CLASS 4.—Imported or Native Gordon Setters or their progeny (over 1 year old). *Dogs*—Low & Vincent, (Rifle); 2d, Geo. Waddington, (Rock); 3d, Geo. S. Roush, Epworth, Iowa, (Frank). *Bitches*—1st, Lowe & Vincent (Gypsy).

CLASS 5.—Pointers (over 1 year old.) *Dogs*—1st, T. A. Wilcox, Cedar Rapids, (Prince); 2, John H. Law, Cedar Rapids, (Chip); 3d, H. N. Smythe, Des Moines, Iowa, (Sport). *Bitches*—1st, S. B. Fleck, Cedar Rapids, (Fly); no 2d award; 3d, L. Hancock, Cedar Rapids.

CLASS 6.—Water spaniels (over 1 year old). *Dogs*—1st, S. B. Fleck, Cedar Rapids (Dick); 2d J. Cobden (Frank); 3d, Pope & Bellau (Sport). *Bitches*—1st, A. C. Taylor (Duck); 2d, Frank Gregor, Cedar Rapids, (Mag).

CLASS 7.—Hounds—1. John H. Law, Cedar Rapids, Iowa, (Wrangler, brindle and w, imported); 2. J. Cobden, Cedar Rapids, (Prince, brindle and w).

CLASS 12.—For best setter pup, of any stock except those bred from imported English sire or dam under 1 year old. 1. J. H. Whitman, (Rob). 2. G. S. Roush, (Frank II by Ranger)

CLASS 13.—For best pointer pup (under 1 year old).—1. Pope & Bellau, Cedar Rapids (Sam); 2. B. F. Mills, Cedar Rapids (Gyp).

CLASS 15.—For best English setter pup dog or bitch (over 6 and under 12 months old, bred from imported sire and dam), Geo. Waddington, Geneva, Iowa, (Daisy).

FLORIDA: ILLUSTRATED WITH CUTS.—This is not the title, though it would do very well as such, of an exceedingly clever travesty upon the much exaggerated and widely promulgated delights of Florida, as seen through the experiences of three nice young men who undertook a winter's sojourn among the fleas and flowers. Some of the designs, which are done in colors, are unique and very original. They would do credit to a master of travesty, and we have no doubt, if reproduced and published would find a wide-spread popular demand. Little conception can be obtained of the brochure unless the text be read in juxtaposition with the drawings that illustrate the various situations. It certainly does not lack the spice of variety and adventure. Man dwindles to insignificance of size, in comparison with the flies, beetles, and creeping things which find prominence and point in the narrative.

—Mr. Henry N. Merriam, of Canada, sends us a circular setting forth the merits of a universal oil which cleans guns, prevents rust, and cures deafness, stiff joints, rheumatism, mumps, and scarlet fever. Ye gods!

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus*.	Grouper, *Epinephelus nigritus*.
Drum—two species. Family *Sciænidæ*.	Trout (black bass) *Centropristes atrarius*.
Kingfish, *Menticirrus nebulosus*.	Striped bass or Rockfish, *Roccus lineatus*.
Sea Bass, *Sciænops ocellatus*.	Tailorfish, *Pomatomus saltatrix*.
Sheepshead, *Archosargus probatocephalus*.	Black Bass, *Micropterus salmoides*; *M. nigricans*.
Snapper, *Lutjanus caxys*.	

FISH IN MARKET.—Since our last report was written our fish markets have been abundantly supplied, and prices have been low. Our quotations for the week are as follows:—Striped bass 20 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen), 30 cents; California, 20 cents; shad (southern), 35 cents each; white perch, 15 cents; Spanish mackerel, 75 cents per pound; white perch, 18 cents; green turtle, 23 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 18 cents; haddock, 7 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 12 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 15 cents; scollops, $1.50 per gallon; whitefish, 18 cents per pound; pickerel, 20 cents; salmon trout, 15 cents; hard shell crabs, $3 50 per 100; soft crabs $1.25 per dozen; red snappers, 18 cents per pound.

Messrs. Holberton & Beemer have received so many inquiries since our notice of Jan. 18th about their new Fly Book, that they have thought it worth their while to have a cut made and advertise it in our paper this week (which see). All anglers who have used the book speak of it in the most flattering manner.

—About three years ago the Greene Fishing Club, of Greene, N. Y., stocked the Round Lake with salmon procured from Mr. Seth Green, and on Saturday, the 2d of January, Mr. Murates Beach, while fishing there through the ice for pickerel, took a salmon that was 19 inches long, 9 inches in circumference at the largest part, and weighed 3 pounds and 3 ounces. Anglers look for some fine sport next summer.

—D. G. Smith, Esq., editor of the Miramichi (Canada) *Advance*, has been devoting much space lately to fish matters, for which he thus excuses himself to his readers:—

"This is a fish and lumber country, which accounts for the fact that our columns have been lumbered with fish matters for the past month."

—Three shad for twenty-five cents last week in Jacksonville market.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported the past week has been 14, one from Newfoundland, three from Grand Menan and 10 from the Banks and Georges. The Bank fleets have met with good success, the receipts for the week being about 400,000 pounds codfish and 95,000 pounds halibut. The receipts of fresh herring for the week have been about 600,000 from New Brunswick and one salt fare from Newfoundland. The stock of fish of all kinds on this market is very light, and as the supply on other markets is small the prospect for good prices the coming season is quite encouraging.—*Cape Ann Advertiser, Feb, 3d.*

SALMON FISHING AT AND NEAR SAN FRANCISCO.

EDITOR FOREST AND STREAM:—

I have for several years lately posted you concerning our young salmon fishing on Oakland Wharf, within an hour's reach from our city. This enjoyable and remarkable piscatorial bonanza still continues in a flourishing condition, as many, probably, as 150 grilse being taken per day by the market fishermen and the rod anglers together. They are running rather larger in size than when I last wrote you, about six week since, averaging now about a pound each, some few being taken from two to nine pounds in weight.

The weather has been, and still is, most favorable for out-of door sports of every kind here, there having been no rain for 56 days to present date. The atmosphere, too, has been, and remains quite mild and very pleasant, with only a few light white frosts early in the morning. But all this continuance of drought and personal enjoyment is at the expense, of course, of our important staple crops. It is unprecedented in the history of the State, so far back as records go, for such a long period in the winter season to pass without rain. But some years, 1850 and 1851, for instance, some rain fell in October, but not again till the following March. If we should be blessed with abundant showers within the next two weeks, there is no evidence that the country will suffer very seriously. Plenty of rain also will most probably bring many more and much larger salmon into our rivers and bays.

The places where there is now excellent grilse and salmon fishing about 100 miles by steamboats, rail, and stage from San Francisco, are the Butano and Pescadero creeks, near the town of Pescadero, on our south, and Russian river up on our north coast. Here anglers may revel in the capture of this species of the *Salmo* family to their hearts content, and with the fly, as well as with bait fishing, especially the former, at Pescadero.

At the last meeting of the Sportsmen's Club; an interesting report was submitted by Mr. Preston (the Club's attorney), on the result of the trial of several parties recently arrested at Pescadero for fishing in the Butano Creek with seines and nets, and therewith catching "salmon trout" as they are termed by many. The case, which was tried by a jury who disagreed, will come up on a new trial soon. The Club prosecuted through Mr. Preston. The point mainly in dispute involves the proper classification of the salmon family, it being contended that the fish caught by the defendants were not "salmon trout" *ipso facto*. To this last opinion I fully agree, knowing that we have as many, probably, eight varieties at least, of the true salmon on our coast. One kind is exactly similar to the common Sacramento and San Joaquin salmon, (the most common south of Mendocino county,) with the exception of having almost completely a square tail and a considerably rounded and rather snubby point of the head or nose. This sort is found mostly on the southern coast about Monterey, and is sometimes seen in our markets about August or September. It is occasionally, but rarely, taken on Oakland Wharf among the Sacamento grilse. I question very much if we have any fish here distinct enough in form, color, silvery whiteness and character, to be properly called a "salmon trout." In fishing for salmon with nets, or bait, (with a rod), large, as well as small brook trout, and possibly at times Lake Tahoe trout, are taken out of season, and this cannot be avoided should these fish become fastened in the net, or caught by swallowing a hook. I think it will be finally decided that the defendants spoken of in the above named law suit will be acquitted, and that quite justly, on the ground that there are no such fish, scientifically speaking as "salmon trout" in California, if in any other part of the world, as stated in the *Pacific Life*, the laws of California are very stringent as to the preservation of all kinds of game, and, I believe, are generally put in force. A heavy fine and imprisonment is the penalty for their violation, and any party has the right to arrest the violator. We frequently hear of arrests throughout the State of those who in illegal season take game. The people of California are determined to protect themselves in these matters, and I assure all sportsmen that the *Pacific Life* will do all in its power to bring to justice parties who violate our game laws.

E. J. HOOPER.

Yachting and Boating.

THE ICE YACHT HAZE.—Slee Brothers of Poughkeepsie, have sent us a very fine picture of Mr. Aaron Innis' new ice yacht Haze, with Richard Knight, its sailing master at the helm.

—Mr. Irving Grinnell's ice yacht "Whiff" made one mile and one eighth in 55 seconds on Wednesday of last week, during a heavy squall.

BOSTON YACHT CLUB.—The annual meeting of this club was held at the Parker House on the 31st ulto. The following officers were elected for the present year:—Commodore, Arthur Cheney; Vice Commodore, F. H. Peabody; Rear Commodore, Andrew Robeson; Secretary, Thomas Dean; Treasurer, Augustus Russ; Measurers, D. J. Lawler and J. B. Smith; Trustees, S. D. Nickerson, Thomas Manning, Benjamin Dean.

Regatta Committee, Coolidge Barnard, Frank E. Peabody, E. Chase Dean, Roscoe P. Owen and Clarence W. Jones.

Membership Committee, Commodore Arthur Cheney and Secretary Thomas Dean, *ex-officio*, A. C. Martin, Chas. E. Russ, William Sewall Whitney.

House Committee, Commodore Arthur Cheney, *ex officio*, D. B. Curtis, Chas. E. Russ.

Commodore Cheney modestly accepted the position to which he is re-elected, and affirmed his interest in the science of yachting.

Ex-Commodore Benj. Dean and Nathaniel G. Herreshoff of Bristol, R. I., were elected honorary members.

The Treasurers report having been found satisfactory, and the House Committee having also reported, Capt. Phillips made a suggestion that the sailing rules be amended so that schooners should not be obliged to sail against sloops in the first class, the rule now reading all yachts of and above 38 feet measurement belonging to the first class. That subject will also be presented at the next meeting. The new club books show that there are now three steamers, seventeen schooners and forty-five sloops owned in the club, and that the roll of membership includes nearly three hundred names. It is expected that this coming season new and interesting features in yachting will be developed by the club.

After the meeting the members received an informal invitation to an elegant dinner, from the Commodore, Mr. Cheney, and the good time was kept up until 8 o'clock in the evening. As the company warmed to the interest of the occasion, jokes and ready wit, followed by repartee, kept them in laughter the most of the evening. The famous actor, Mr. John McCulloch, (introduced by Com. Cheney) held the attention of the company, by two recitations, which received loud applause.

On motion of Ex-Com. Dean, the privileges of the club was tendered to Mr. McCulloch during his stay in Boston. The company broke up with the familiar song, "Auld Lang Syne."

W. S. N.

MICHIGAN.—*The Coming Regatta of Amateur Oarsmen.*—Our Detroit correspondent sends us the following items of interest regarding boating in that vicinity:—"The Detroit River Navy, composed of the Detroit, Excelsior, Zephyr, Wantaga, Centennial, and Chatanooga clubs are hard at work preparing for the next regatta of the National Association of Amateur Oarsmen, to be held in this city August 15th and 16th. No means will be left undone to make the regatta a brilliant success. It is also proposed to hold the next Northwestern Amateur Rowing Association in Detroit. The proposition meets with general favor. The Regatta Committee, to take charge of the National Regatta is composed of H. E. Buermayer, New York, J. R. Stevens, Saginaw City, and H. W. Garfield, Albany, N. Y. An effort is being made by the Detroit barge crews to induce the National Association to include barge races in the next regatta programme. There is no other city in the Union where barge racing is made so much a speciality by oarsmen.

ROVER.

NEW YORK YACHT CLUB.—The annual meeting of this club was held on the 1st inst. and the ticket as printed in our last issue was elected without any opposition. The following words were added to Article IX. of the constitution:—"But no owner, by reason of owning more than one yacht, shall be entitled to more than one vote."

The subject of club houses was referred to a committee of five, who will report at a special meeting to be held on the evening of the 15th inst. Four new members were elected.

YALE AND CORNELL.—At a meeting of the boating men of Yale College on the third inst., the Cornell matter coming up, a motion was made that the challenge be declined, and Mr. Bushnell, '74, spoke in favor of the motion, stating that Yale gave Cornell an opportunity to row at Philadelphia, and Cornell declined and could not be induced to enter a crew, although strongly urged by graduates, and that it was the purpose of Yale to keep the Yale-Harvard race free from any innovations. The vote to reject was then carried unanimously. There is no doubt but that funds will be raised to carry out the projected Harvard race. There are twelve men now in training, from whom the crew of eight will be chosen.

Rational Pastimes.

BASE BALL.

Base ball talk is already prevalent in sporting circles though the skating season has not yet ended. Great preparations are in progress for the coming campaign, especially in the professional arena, in which six League Association clubs and about twenty International Association clubs will enter the lists. A new club is being organized in Philadelphia with a team which will include such reliable players as McBride, Roach, Fisher, Sensendorfer, Meyerle, Eggler, Fulmer and Hall. It is to be run on a limited stock company basis.

—The delegates to the Convention of Professional Ball Clubs, called together to organize an international association, will meet in Pittsburg on February 20th. It is expected that at least twenty clubs will be represented.

—The St. Louis team for 1877 will be as follows: Clapp, Nichols, Dehlman, McGeary, Battin, Force, Croft, Remsen, Bloug and Dorgan.

—The League Association book, though an improvement on last year's book, contains not a line of statistics about the championship contests, such as giving the games won and lost in a special table. In the record of games played credit is given to the Boston Club for a three to two victory obtained by the Hartfords. This is an important error for an Association book of statistics.

—Borden, under the new rules of the League, has deemed it advisable to compromise with the Boston Club, and he is now off the salary list of that organization.

—Those of the Boston team at present in the city are George Wright, Leonard, O'Rourke, Murnan, Manning, Morril and Brown, all of whom have begun practice in the gymnasium of the Young Men's Christian Association. The boys are taking a daily run in the hall in addition to other exercises. Manning prefers the Boston Club to all others, and knows nothing about any propositions to go to Cincinnati. He says he has not been approached upon the subject.

—The "Base Ball Guide" will be issued immediately after the Pittsburg Convention. Mr. Chadwick has prepared an elaborate appendix to each rule of the new code of the League, explanatory of each section. It will be a work of over a hundred pages.

SKATING.

Southerly winds prevailed to such an extent from February 1st to the 5th as to render the skating lakes of the metropolis useless for the sport, the ball being down at the Park and Capitoline lakes since the 1st inst.

At the Brooklyn Rink, however, roller skating has been largely patronized, another large crowd being present at the second Fete on February 1st. On February 3d inst., at the night seance, there were over nine hundred people on the floor at the Rink on skates. The next Fete takes place February 8th, with races on the 10th inst.

TO CONTRIBUTORS.—The following original contributions are awaiting publication. We will dispose of them as fast as our space will permit:—

Sealing in the Pacific; Indian Joe Maree; Lake Superior Sketches—A Series; Turtle Egging in Florida; Louisiana Duck Hunting; Dusky Litigation; Pine Forest of Pa.; Club Footed Buck; Christmas With a Life Boat Crew; Notes From My Diary (Ill. River); Fishing off Nantucket; A Snow Shoe Tramp; Woodcock Shooting in July; Shooting Around Port Royal; Hunting in Mississippi; Crow Blackbirds; My First Bull Moose; Soooting in Southern California—*El Cazador;* Fighting the Rare; Day's Hunt in California; Our Camp on the Ausable; Trip to Stony Island; The "San Gabriel Narrers"—*El Cazador;* Trout Fishing on the Aar; On the Sunflower River; My First Trip; The Backwoods Canvasser; Some Incidents on a Whaler; A Moose Hunt in Canada; Sport in Michigan; Chickens in Minnesota; On to G. Lake; The Blue Grass Region of Kentucky.

ALEXIS.—That the Russian Grand Duke who is now visiting this country is a sportsman any one knows, for on the occasion of his last visit he passed some time on the plains with General Custer, to whom he presented some valuable deer hounds, now in the possession of Edwin Thorne, Esq. Since Alexis arrived he has been taken in hand by the sportsmen of Norfolk and vicinity. He has had fine squirrel shooting, and the Norfolk Fox Hunting Club have given him a grand fox hunt.

—There is little or no ice in the sound, and the 11 o'clock night boat for New Haven from Peck Slip resumed her trips Feb. 5th. The boats of this line are heated throughout by steam.

—John Stratton, of Monroe county, Tenn., recently killed six black bears during a heavy snow which prevailed in that part of the State.

TIMELY.—The letter of our Danville, (N. Y.) correspondent will be found to contain some timely and valuable suggestions.

—History will bestow undying laurels upon the bold citizen of Cincinnati, who recently, when a plumber sent him an exorbitant bill for $500, in his turn sued that plumber and recovered to the extent of $2,000 for damages, etc., on account of the abominable manner in which the work was performed.

—Miss Clementine V. Lasar, the first soprano singer of Plymouth Church choir; was married to George S. Studwell on Sunday evening, at half past five o'clock, by the Rev. Henry Ward Beecher.

—Neck mufflers for ladies, of silk trimmed with chenille fringe, are much worn. They come in all colors.

New Publications.

THE CENTENNIAL EXPOSITION. Described and Illustrated: By J. S. Ingram. Published by Hubbard Bros., Philadelphia.

This is a volume which every person should buy who wishes a lasting souvenir of the great Exhibition. Its title indicates its character sufficiently, without requiring extended comment. It comprises a properly illustrated history of the Centennial from the beginning to the close, with a description of the principal buildings and their interesting displays, the Memorial parades and anniversaries, State days, awards to exhibitors, and numerous other subjects showing the magnitude and character of the World's Fair, and illustrating the best achievements of human genius, industry and skill, from all lands and all peoples. The publishers invite the most careful scrutiny as to completeness before purchasing.

The *Nuttall Bulletin* for January, 1877, is no less attractive than the numbers which have preceded it. The present issue opens with a delightful account by Mr. Brewster of one of our most beautiful warblers, *Dendroeca maculosa*, in which a full *resume* of its habits is given in an unusually pleasant style. Mr. Ridgway furnishes a brief note on the Western variety of the Robin, which he dignifies with the varietal name *propinquius*. The recent abundance of the Snowy Owl along the New England coast is noticed by Mr. Deane, who gives us considerable information on this point, drawn from several different sections of the country.

In an article entitled "Distribution of New England Birds," Mr. H. A. Purdie replies at some length to Dr. Brewer's article in the preceding number of the *Bulletin*. Mr. Purdie does just what Dr. Brewer asked of him, and gives a list of facts authenticated by references, which fully sustains his position. The article is of great interest and is calculated to settle many disputed points, especially in reference to the northern range of some of our summer birds. Mr. Lawrence, in a short communication, relates the facts in reference to the occurrence of *Bernicla leucopsis* near New York, which were recorded in this paper some weeks ago, and Mr. Hurick informs us of the capture of a second specimen of *Helminthophaga Lawrenceii*. The occurrence of Several "Birds Rare or Accidental in New England," by Mr. Purdie, closes the number; but our space will not admit of our noticing the article at length. The general notes are as usual interesting and valuable.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Baths.

Russian Vapor, Marble, Baths.

NO. 25 EAST FOURTH ST., NEAR BROADWAY

The most extensive, luxurious and popular baths on this continent. Call and see the testimonials, signed by the most eminent physicians of the city, to their value as a remedy in Cold, Catarrh, Sore Throat, Gout, Rheumatism, and many other afflictions which originate in an inert skin. dec7 3m

The Kennel.

The St. Louis Kennel Club.

(C. B. WHITFORD, TRAINER.)

are the owners of the following dogs:

ROCK, an imported English setter (formerly owned by Luther Adams, of Boston.) He was a field-trial winner in England, and won first at the Springfield, Chicago and St. Louis bench shows. Also won first at Baltimore (1877), the Special prize for the best setter in the show, and other Specials.

ELCHO and ERIN, both imported red Irish setters. Elcho won first at the Chicago Show; was a winner in the Puppy class in Ireland, and first prize at Baltimore (1877). Is sire of Alleu, the red Irish bitch which won first at the Centennial bench show; and of Norah, who won 1st at the St. Louis show. ERIN won 2d at Chicago in the Open class, and 1st as the best Irish setter for stock purposes shown with two of his get. He won the "GREENWOOD CUP" IN THE FIELD TRIALS LATELY HELD AT MEMPHIS, also WITH DRAKE WON FIRST IN THE BRACE STAKES.

The price for the service of either of the above dogs is thirty-five dollars.

The club are also the owners of the imported English setter bitch Dora. She is either the dam or grand dam of all the "blue blooded" English setters that have won prizes at field trials in this country.

They also own the English bitch ROSE and the red Irish bitches LOO II. and ROSE. The English setter bitch Rose is by Rock, out of the pure Laverack bitch Pickles. LOO II, and the Irish bitch Rose are both bench show winners. Address,

POINTER AND SETTER FIELD TRIAL BLOOD.—Pointer bitch Teal, of the very best Field Trial blood, by Lord Downe's Mars Field Trial winner, out of Lord's Lill Field Trial winner. Mars by Drake, the best pointer ever bred in England, and Lill is by Hoiford's Bang, out of sister to Hamlet. Teal is 2½ years old, and has had two litters of puppies; the first by Fletcher's champion Don, and two of the puppies will run at trials and be shown this year. The second was a beautiful litter of seven by Y. Bang, and they all look like prize winners. Teal is due in season now, and will be again put to Y. Bang, who is by S. Price's champion Bang, out of Davey's Luna. Price 40 guineas; guaranteed in pup by Y. Bang.

Setter bitch Lady Ti, eleven months old, by Bailey's champion Laverack Victor, out of Bess. Lady Ti is now in the hands of a first class breaker, to be prepared for the Field Trial Derby, ran May 2d. She can be sold with the engagement, and left with the breakers until May. Price, 30 guineas, half to be paid at time of purchase and the remainder on leaving England—if left for her trial. Application should be made at once for Teal, if wanted for America in pup, as she will probably go to dog the third or fourth week in Jan. Apply to G. LOVE, The Kennel Club, 2 Albert Mansions, Victoria street, London, or to the Editor of this paper, who has further particulars. feb1-2t

FOR SALE—ROCK AND ELCHO.—Each stands at the head as the Bench Show winner of his class over all the dogs in America. Rock's pups won first prize at Chicago, Springfield, St. Louis, and Baltimore. Elcho's pups won first prize at St. Louis and at the Centennial.

Mr. Campbell, of Tenn., says the pups by Elcho, out of his Black Joe, "are very fast and have the best noses he ever saw on any dogs." ST. LOUIS KENNEL CLUB, 706 Pine st., St. Louis, Mo. feb1-1f.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down fine.' This need not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holxbird! Scatter! you beggars, scatter!'"—FOREST AND STREAM.]

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT," made by **C.W. Simmons & Son.**

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

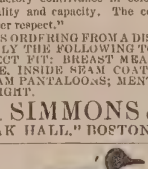
"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.



In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining he best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

A "NEW LEGEND OF THE FORGET-ME-NOT."

WHEN Psyche lost her Lord, the Lord of Love,
Weeping alone she wandered,
Listless by every well-known field and grove,
And on her lost Love pondered.

Lastly by Lethe's stream her footsteps strayed;
And "Oh!" she said, in sighing,
"That I might dip, and my past life be made
Like dreams with daylight dying!"

The big tears from her blue eyes raining down
Fell on earth's pitying bosom;
Sudden there sprang amid the sedges brown
Blue as her eyes a blossom.

And o'er head, soft rustling sweet and low,
As though some bird's wing fluttered,
In those loved tones whose loss was all her woe,
"Forget-me-not!" was uttered.

No more: no sight, no touch: these words alone:
And "Ah!" she cried, "forget thee?
Nay, but half Love in our glad life was known;
Half Love to regret thee.

"Forget thee? Nay, these flowers my tears begot
Shall be to me a token
Of Love: They shall be called Forget-me-not,
The name to cheer me spoken."

So well, sweet river-flowers, we welcome you,
Earth with faint sadness scenting—
Born of the tears from Psyche's eyes of blue,
For her lost Love lamenting.

—*Spectator*

For Forest and Stream.

A Tale of Two Flats.

TO-DAY brings us a northeast rain storm. I remember my promise to commit some piece of folly the first rainy day. And now for a subject. What shall it be? A tale of angling in the pleasant summer time? Nay, outlook and surroundings invite not memory in that direction. I have it; the weather without is wild and stormy. The howling wind, the driving rain, the lead-gray storm clouds, the curling waves, all conspire to indicate my theme. Such weather must the fowler oftimes brave in pursuit of his favorite game. Such weather was I myself wont to select in days of yore for short trips to the "Cape" and elsewhere in pursuit of wildfowl. "Fowling" shall be the subject. While I listen in vain for dissenting voices, the nearest shade-tree, bowed by the east wind, nods its approval of the choice.

It is not proposed to tell a twice-told tale, nor to weary the reader with any multiplied detail of rules for fowling operations; that ground has been fully occupied; but rather to reproduce for his instruction one or two scenes of actual occurrence illustrative of the value of coolness and strategy at critical points of time. The successful fowler must be fertile in resources and prompt in emergency. The right thing must be hit upon and executed at the right time, as great opportunities seldom offer. But to our tale, which I will entitle "A Tale of Two Flats."

FLAT FIRST.

At the elbow of Cape Cod and inside the sheltering range of sand cliffs which forms the lower extremity of Nauset Beach is a wide expanse of shoals known to the hardy fishermen and mariners of the vicinity as "The Common Flats." These shoals when bared by the falling tide disclose miles upon miles of mud flats covered with the marine mud commonly known as eel-grass, the favorite food of several varieties of wildfowl, but more especially of the brant. Landward from these mud flats, and also protected from the encroachments of Old Ocean by Nauset Beach, stretches an extensive series of sand flats, one of which, the scene of the incident to be narrated, is yclept "The Drain." This part of the "Cape" was in olden time a favorite hunting resort of a number of New Englanders, among whom must be counted the writer. In the pleasant summer and early autumn days different varieties of bay snipe afforded sport to its votaries. Later in the season black duck, coots and killdrake became objects of pursuit, while in the early spring the brant never failed to put in their appearance as harbingers of the balmy breezes whose advent they were wont to await at this point with all the serenity ascribed by the poet to "Patience on a monument smiling at grief." The brant, too, at times, smiled upon the fowler, and at times steadily refused to be lured within shot by the blandishments of their brethren enticingly exhibited to their gaze on the point of a small sand island, apparently its sole occupants. But woe to the flock which, yielding to the temptation, descends upon the shallow water, and in fancied security, first swimming, then wading, huddles upon the narrow point. Soon will belch forth from iron mouths bright tongues of flame and leaden rain will scatter death and destruction among the stricken ranks.

It was about the middle of April, 1858 or '9, that kind Fortune vouchsafed me one of those chances which only occur once or twice in a lifetime. In company with Alonzo Nye, a hardy native of the town of Chatham, I was occupying a sunken box in an artificial sand-bar raised with much toil and labor on "Drain Flat" before mentioned. The previous week had afforded remarkably fine shooting, more particularly to Mr. Hapgood, of Boston, who had the good fortune to occupy the best post during the best day's shooting ever known at Monomoy. From my coign of observation behind the crest of a towering sand-hill near our shanty I watched all proceedings through a powerful opera-glass, and for some four or five hours on that day did the brant continue to fly as I never have seen them before or since. No sooner was a shot made, and the dozen or score of victims retrieved and all snug again, then another and another flock would come up, and, sighting the decoys, at once pitch to join their fellows. And so the slaughter continued. I have forgotten the exact score for that day, but to the best of my recollection it mounted to somewhere about one hundred and fifty, all brant.

Sunday had passed and we were back again at the shanty in pursuit of the wary brant. The novice will please bear in mind that in this description of shooting it is comparatively a rare thing to get more than three or four shots in a tide, the common practice being never to shoot at single birds and seldom at small bunches within easy range, but rather to allow them to remain on familiar terms with the decoys, and thus help to entice larger numbers of their companions within reach of the gunner. Monday and Tuesday afforded quite a number of productive shots, realizing an excellent score, but failing to equal the previous week's achievments. Wednesday came, and at half flood tide Mr. Nye and myself proceeded to occupy our accustomed box. The weather was of the finest, too warm and pleasant to offer much chance of sport. But fortune decreed otherwise. With but little to show for our patient watching and waiting the ebb tide was fast leaving our bar, and in another half hour all chance would be over. Yet game was in sight, and plenty of it. Less than 200 yards distant, at the edge of the water, were assembled thousands of brant, they having been steadily gathering at that point, and their numbers continually augmenting by fresh arrivals. Vainly had we hoped that a passing sail or the report of a distant gun would start them out of their safe quarters. There they remained in such immense numbers that it was evident each fresh arriving flock would be attracted solely to them rather than to our tiny display of two or three birds. Here was a dilemma; myriads of brant at hand and not a bird within shot. A hurried consultation was held, and a method of heroic treatment agreed upon and instantly executed. With a bound Mr. Nye sprang out of our hiding place, swung his hat in full view of the birds, and in less time than I am consuming in the narration was again concealed from view. The result was better than we expected. Instead of going off oceanward in a body and giving us a further chance of getting down some laggard flock, the entire mass scattered in all directions. On either side of, before, behind us the air is filled with the startled masses of birds, while we, crouched down and still as mice in the bottom of our lair, quietly await the result of our little strategem. Presently a company circling nearer and nearer sweeps over our box, fanning us with their wings, and by the gush we know they have alighted. At this juncture I venture to take a hurried peep, using the utmost caution in so doing. A sight such as I never before saw and shall never see again was revealed to my astonished vision. From all parts of the horizon flock upon flock of brant were heading in countless numbers direct for our reinforced decoys. Instantly I resumed my position in the deepest depths, and it was full fifteen minutes before a cessation in the roar of wings announced that a second look could be ventured. Bringing our pieces to full cock in the way of preparation for all emergencies we cautiously raised our heads and deliberately surveyed the scene. Within easy shot, and all about us stood, waded, swam and played more than five thousand brant. It would have been impossible to shoot in any direction over the surface of the water without killing twenty or thirty, and Mr. Nye favored this course, but our main chance lay upon the point of the bar, which was solidly covered in with brant. There, too, were our decoys buried in the mass of wild birds and totally indistinguishable in the ruck. Requesting Mr. Nye to use all possible effort to extricate our own birds I brought my heavy (16 pounds) piece to my shoulder and held it steadily in position. Some five minutes were consumed in accomplishing the desired result, my companion all the time assuring me that "it could not be done," to which I steadily replied, "keep on trying; the birds shall not get away if they skip." Finally, by dint of reiterated jerks and pulls our decoy birds were forced out of the ranks of their visitors and as soon as fairly clear lowered their snake-like heads, and, as if endowed with a prescience of coming events, ran some two or three yards sidewise out of the line of fire. Instantly Mr. Nye raised his gun and we fired simultaneously, getting our seconds well as the birds rose. Oh for reserve pieces to discharge into the ranks of the flying battalions, but none was at hand. The shooting over I jumped out of the box and ran as quickly as possible in the direction of the deep water for the purpose of heading shorewards any winged birds that would otherwise be likely to effect their escape. This was always an invariable custom with us. Not so did Mr. Nye. Getting beyond the furthest cripples, and knowing them safe I turned and looking back beheld the water and the bar sprinkled with dead and wounded birds, while the hitherto always stolid and impertubable Alonzo, totally overcome by the agony of the situation, was performing a sort of Indian war dance on one leg, brandishing aloft his hat, ('twas the hat did the business), dashing it viciously upon the sand and excitedly inviting me to come and take it. Candor compels me to add that the hat was an old yellaw tarpaulin not worth the taking. As all things earthly have an end so did friend Alonzo finally sober down *and sit down*, leaving to me the task of chasing and running down the cripples. This accomplished we proceeded to count and tie up the slain. Our final shot yielded forty-four birds, and had Mr. Nye been shooting a suitable piece instead of the seven-pound popgun he was actually using we should certainly have bagged at that one shot sixty or seventy brant. I have always considered that full three-fourths of the birds fell to my gun. On the one side were six ounces of No. 2 shot driven by sixteen drachms of powder—on the other two ounces of shot driven by five drachms—the reader can form his own opinion. Mr. Nye and myself continued to shoot together the rest of the week; and our next four shots, made, I believe on the following day, yielded seventy-seven birds, thus giving a grand total of one hundred and twenty-one in five consecutive shots. This week, as a whole, afforded the best brant shooting I have ever enjoyed; but no one day equalled in results the degree of success attained by Messrs. Hapgood and Bearse on Friday of the previous week. I may add that the Linnall brothers, of the town of Orleans, neighbors in the nearest shooting box, surpassed our forty-four strike, and came over to our bar to lend a helping hand in getting away our strings of game. It seems almost superfluous to mention that our good *coup* passed upon record *facile princeps*, the best up to that time, and if it has been excelled, or even rivalled, the report has not reached my ears. Will some member of the Massachusetts Brant Club enlighten us?

So ends the story of "Drain Flat."

FLAT SECOND.

Between the headwaters of Currituck Sound, otherwise known as the Back Bay, and the outside ocean beach is a desolate sand flat, known to residents and to sportsmen as "The Sand." This almost desert extends north and south a dozen or more miles in length, ranging in width from half a mile to two or three, and along its inner edge in *ante bellum* times presented excellent points for the destruction of that most wary of all fowl, the Canada wild goose. In those days, whatever may now be their habit, the market gunners of the neighborhood bestowed their entire attention on the Canada red-head and wigeon ducks which, feeding almost exclusively in the shoal waters adjoining the different islands in the bay, were sought for as giving the best results pecuniarily, and as affording a more certain and much easier kind of shooting than the pursuit of geese on "The Sand." For the former a dugout and a set of wooden decoys is sufficient. For the latter a number of live geese and a water-tight sunken ambush were indispensable. Thus it happened that "The Sand" remained

comparatively unmolested. During the earlier part of my story, following the rule, I shot day after day from the different points upon Long and its neighboring small islands, and with but indifferent success. While thus occupied I could see almost every day, with a powerful opera-glass, flocks of geese at intervals along the opposing shore contentedly standing at ease, and saucily pluming themselves (on their safety). It was now the last of February, my time nearly up, and I resolved to turn my attention to the geese and give them the benefit of my previous experience at Monomoy. My host, Mr. Burroughs, possessed a number of pinioned wild geese, great strong fellows, every one insisting upon fighting a pitched battle as often as they were required for use. There was also upon the premises a good-sized plank box, originally made for the very purpose to which I now proposed to put it. This was quickly calked, pitched and placed in position on "The Sand. The spot selected offered a double advantage. Directly in front a narrow sand spit projected some five or six rods into the water, while on the right of the spit a little cove, considerably indenting the general shore line, and consequently within easy range of the shooter's position, afforded an admirable location for posting a set of decoy ducks. One problem remained. On that flat unbroken beach the slightest object forced itself upon the attention even at an immense distance. What disposition could be made of the shooter's boat? The only answer was that it must be disposed of and some birds lost, since the water was wadeable for only a short distance from the shore.

For some days after all was ready the weather was still and unfavorable for all kinds of shooting, and gave no results worth mention. But one evening said Mr. Burroughs, "You had better try the geese to-morrow, as I am sure we shall have a stiff southeaster." Thus encouraged I made all ready to get off an hour or two before day, and daybreak found me duly ensconced in my box, decoys in position, and my boat half a mile distant to the north, well drawn back from the shore, placed endwise to all birds approaching from a southerly direction, and well covered in with the common drift grass of the locality. Concealed in this manner, whatever birds might take it for it bore no resemblance to a boat. My arms were one sixteen-pound gun and two smaller pieces of ten and eleven pounds respectively—all of unexcelled quality, and to this day able to speak for themselves in any company.

A well-known aphorism runs thus: "The early bird catches the worm," and, although much of Roosevelts opinion that sometimes he does and oftener he doesn't, on this particular morning I must confess that I, the early bird, did pick up in a very short space of time a goodly number of worms in the shape of pin-tail ducks, which commencing to fly at daybreak in large numbers along the beach, not having been molested at this point, and assured of safety by the presence of wild geese (the decoys), lowered and swung well in *every time* and gave me the only sure thing I ever had on this shy bird. The next time I tried it they had learned a thing or two, and in general avoided the ambuscade. The flight lasted scarcely half an hour, and in that time I had gathered in some twenty ducks, all but one or two pin-tails. Clearly I had them foul.

For some hours after sunrise little or no breeze stirred and few shots offered, mostly at bald-pates. About 11 o'clock the promised southeaster put in an appearance, and with it ducks in considerable numbers, trading in all directions as if enjoying the change. By noon the wind was lively and the honking of geese was heard to the southward. Soon they commenced working in my direction, and in the course of three or four hours I had made a number of successful shots at small companies of a dozen or less, but this scarcely met my expectations. Had I not seen hundreds gathered at this very spot a fortnight before? Where were they to-day? Not over two hours to sundown, the wind rapidly falling and nothing remarkable save the morning's shower of sprig-tails. A change was at hand. Loud honking was heard in the distance. Yes, there they are at last. As near as I could judge fifty of them. On they come, low to the water and steadily heading "up sand." Will they stop here? Yes, they are down, and snaking direct for my answering honkers. A few minutes later a second cautious look shows them well out of shot and apparently inclined to keep at a safe distance. Something is wrong. I now allow them full ten minutes to examine their surroundings, and take a third peep. Slowly and cautiously I raise my head (covered by a snug sand-colored skull cap with small visor) pressing my shoulders hard against the back of the box in order to guard against the slightest lateral motion, and lo! there are my geese in the same place, and evidently in a state of uncertainty. No *not all*. I suddenly catch sight obliquely of an old gander standing on the sand within ten yards of me, and to my infinite disgust and horror at the same instant he sights me too, and away up heavenward goes his head in vain endeavor to make his vision penetrate over and behind and into the little sand knoll which he mistrusts to contain something mysterious and menacing. Quick as thought my tactics are decided upon. Even as we caught sight of one another so I maintained my position front faced, eyes left, rigid as a corpse, scarce venturing to breathe much less to wink. Thus we two confronted one another, eye to eye, if not altogether face to face, for full five minutes, for all the world as if each were endeavoring to outstare the other in a contest for victory, when he, half convinced, took a step or two and pretended to drop a feather. On the alert I at once commenced lowering my head as imperceptibly as possible, but he too was watchful and again fastened me with those piercing eyes. Again the same still pantomime, or rather tableau, but this second time, less persevering than before and sooner relaxing his vigilance, he gave me the coveted opportunity to complete my "escamatage." This next look in my direction was undoubtedly reassuring, and this satisfactory condition of things then telegraphed to his hesitating convoy, which had steadily maintained its position well out of shot. Once down and out of sight guns were inspected and the best disposition made for rapid handling. A few moments later, with my heavy piece in hand, I again straightened up. The flock had divided, the smaller section had landed a little to the left and were scattered along shore just beyond the decoys, while the larger—some thirty in number—were just getting footing on the convenient sand spit in front. Heads and necks ranged beautifully, and delaying just long enough to make dead sure of my nerve and ability to "hold on" I pulled four triggers in rapid succession, having first alarmed the birds with a low whistle. Of the geese shot at few escaped unscathed, and of the remainder half lay dead and half crippled. Again, losing no time, I rushed to the point of the spit, discharged No. 3 at two of the handiest cripples, laid it down upon the sand, and resorted to the old tactics of at once getting as far outside of the cripples as possible. I thus succeeded in driving ashore a number of them, which were soon secured. The larger portion, however, made good their escape. I was well out of my scrape with the old gander.

By dark I had a dozen or more ducks (mostly black ducks) to the day's doings the exact score of which I lost, as getting home long after dark, tired and hungry, I was glad to hand boat, coys and spoils over to the old darkey who had been patiently waiting at the landing, torch in hand, to guide me in the darkness, and who at sight of my bonanza burst out with "Golly, Mars Charlee, yous gub it to um dis time, suah." The next morning I found my birds hung up with others previously shot.

I realized that day over thirty geese and about fifty ducks.

A market gunner informed me a day or two after that he had witnessed my afternoon's proceedings from his position on Shell Point (directly opposite across the bay), and further that he had never known such a shot to be made in that neighborhood, adding in his peculiarly bizarre dialect, "We uns don't know to destroy geese like you Yanks."

My tale of "The Sand" as it was is told. Will some of your numerous readers give us a tale of "The Sand" as it is? RUSTICUS.

For Forest and Stream.

SPORTING ON THE BIG SUNFLOWER.

IF there is a stream in the wide world where navigation is difficult and where steamboatmen have at least some excuse for tall swearing, I would say that the Big Sunflower is ahead of them all. There are a great many "bars," and at times every steamboat passing up or down has to pull over these with a line. The boats are supplied with steam capstans, or, as they are invariably called, "niggers," but for which appliances it would be next to an impossibility to navigate here at all. Each boat is accompanied by a barge, upon which the cargo is carried. The boats themselves draw so much water that putting any freight on them is out of the question. The course of the river is tortuous almost from its source to its mouth, and in many places the "bends" are so abrupt that the boat has to be aided in making the turns by men in the bow pushing her off with long poles. And there are places where the barge, which is towed directly in front, has to have one side line cast loose, in order that it may swing around the point. A pilot on the Sunflower Belle assured me that the river was so crooked that a duck could only make the worst bends by backing on one foot and "going ahead" on the other.

In most places there is no trouble finding trees on the bank within reach of the cable to which to make fast when a pull over a bar or a sunken log is required; but now and then, where there is a wide, flat, muddy shore, it becomes necessary to bury a "dead man" for a hitching post. A "dead man" in river parlance is a log buried in the earth and staked down, with cord wood sharpened at one end so as to be easily driven. On Oliphant's Bar, and one or two other places, one may see quite a number of these dead men. I was an eye witness to the burying of one of these this morning. There had been a heavy rain last night, and the wind shifting to the north about two o'clock it had cleared off and turned very cold. The boat had been laboring five days to get out of the river, the officers and crew were about worn out, and every one on board was anxious to get into reliable waters. We had passed the last "bar" but one, and were within two miles of the Yazoo, when the boat ran hard upon a "lump" in the "thin" water on this very bar; the wind blew her stern over against the shore, making us lie almost broadside in the river, and rendering a pull necessary. No tree or stump being within reach the dead man had to be buried. Capt. Stevens pushed off in a "dug out" to make soundings, and finding eighteen inches of water between the bow of the boat and the shore nearest to it, the ponderous wet and muddy hawser was piled into the yawl and run over there. But even the yawl grounded, and the men had to jump into the water and mire and haul the line out to the position of the dead man. The Captain set the example by first plunging in and shouldering a part of the line. All hands were cold, and as the men sank to their knees in the mire while dragging out the line and carrying up the long log for the dead man, one could not avoid shivering, even while in the cabin standing by a comfortable fire looking at this cheerless funeral.

Steamboatmen are, as a usual thing, liberal in the use of oaths. I have heard more swearing, louder and more vigorous and emphatic swearing, on the present trip up and down this river than in many and many a day before, and I have felt that if such a thing was necessary at any time, or excusable under any circumstances, the necessity and the excuse were found in the trials and hardships attending navigation in this river. Every one has hard work to do; the men are wet and cold half the time, they get their meals and sleep irregularly, very little of the latter at any time, unless the boat lies up. Hardly any one, even the best natured of men, can keep in a good humor half an hour at a stretch; and thus there is one continual rumpus after another. This morning two poor, improvident negroes, half clad, wet to the skin, and nearly frozen, refused to do their duty as deck hands, when the Captain ordered them up to the clerk's office to be paid off and put ashore. While standing outside at the window waiting for their pay, one of them made some insulting remarks about the boat. In an instant the clerk jerked a pistol out of his drawer, fired a shot out of the window, took down stairs after the fleeing darkies, who fled forward on the cotton barge, and after firing two more shots returned to his office. None of the shots were fired at the man, but it had the effect of scaring all hands at the moment and of putting an end to an incipient mutiny.

One day, coming down, the boat made only sixteen miles and tied up in the narrow and crooked part of the river for the night. The barge was so heavily laden with cotton it was deemed dangerous to run it after dark for fear of knocking out the bottom. While going up, navigation is carried on by means of torches at the bow of the boat to illuminate the channel. That night the hands were busy till near midnight cutting wood for fuel. Wood piles are not numerous along the stream, and occasionally boats find themselves out of motive power.

I started out intending to write you a short article giving an account of another fishing and hunting excursion, but it fell in the way to say something about this river, and the two being so intimately connected, it may not be amiss that it has been said. The fishing party in mind consisted of Dr. Birchett, of Vicksburg; Mr. Price, Robinson, myself, and George, the colored cook. They left Vicksburg on the Sunflower Belle on the 6th inst., and by fair sailing will reach home about dark to-day. They made the same encampment as the party I heretofore wrote you about, and spent near a week in camp. Most of the party spent the principal part of their time in hunting, but your correspondent devoted himself to the fish. Game was seen in some quantities, but not much captured larger than squirrels and coons. The party saw perhaps fifteen deer in all, and had some good shots, and were able to bring in hair, but not any meat. Dr. Birchett wounded a bear, and had sundry shots at wild turkeys, but unfortunately left them all in the woods. It seemed to be generally conceded that the hunters were not proficient, and that had they been so the party would have been able to carry home large quantities of game. Deer, bear, and panther sign was to be seen everywhere, and the trees were alive with squirrels. The howling of a gang of wolves across the river opposite our camp at night kept our boy George in a continual fright, and at the last he refused to sleep in his own tent. Ducks were scarce this time near our camp, but as we came down they have been numerous, and to day some have been killed from the bow of the boat. We have also seen to-day some flocks of wild geese, one of which allowed the boat to approach so closely that had any one been on deck with his gun he could have secured one or more.

Of fish the party captured a large number of black bass and another variety of perch, the correct name of which I do not know. Here they are called white perch (but here they call black bass "trout"); in Kentucky they are called "bachelor perch," and in Indiana they designate them as "tin mouths." They are a very broad fish, somewhat spotted, the spots even extending into their fins, have a long tiny mouth, are sluggish "biters," make but small resistance when hooked, show all the colors of the rainbow in the sun when first taken out of the water, and are as good fish to eat, with as white meat as I ever saw. They rarely exceed two pounds and a half in weight, and go in schools it is supposed, from the fact that when you catch one in a place you are apt to take others there at once.

No striped bass were taken this time, and all the black bass were small, the weight of none exceeding three or four pounds, the preponderance in numbers being much smaller. No artificial bait was tried, live minnows being in such wonderful abundance and so easily obtained were used exclusively. A man who had a fish boat some two miles below our camp rowed up to us in his skiff one day, and in describing the merits of the different kinds of bait for the Sunflower river, declared that cuts from the sides of small perch to be superior. And in proof of his assertion he ran over to a tree top lying in the river just opposite our camp and in a moment hauled in a bass weighing about three pounds.

As I said in my former letter, it is doubtful if there is any place where one can find better fishing and hunting combined than almost anywhere up this stream in the fall of the year when the river is low and swamps dry. Boats make regular trips as high as they can go, the officers of which take great pains in making a trip with them pleasant and agreeable. Nearly all of them are themselves residents somewhere on its banks, and know the country thoroughly. They are ready almost any time to accompany

one, and as we came down, Capt. Stevens, of the Vicksburg, got ashore with us, ordered his pilot to stop and whistle at a certain point, while we took a near cut through the woods and jumped a couple of deer. The Bookout brothers, one captain the other pilot of the Sunflower Belle, are known throughout this region as about the best shots in it, and whenever it is possible for them to get off duty, one or the other of them gladly makes one of a party of hunters. They are comparatively young men, but I think as fine woodsmen and hunters as I have ever seen. Their boat is a comfortable one, and sportsmen are at home on it. Yet few sportsmen ever come here. The region is comparatively unknown. The people, even in Vicksburg, are just learning of it. But the men of sufficient means and leisure to devote much time to fishing and hunting, combined with a desire for engaging in those sports, are scarce in this country; and for that reason the chances are that the attractions of this country, in that respect, will last for many years to come. For Forest and Stream.

TROUT FISHING ON THE AAR.

A SHORT time ago, spending the summer in the beautiful Village of Laugen Schwalbach, Nassau, Prussia, I found that a friend of mine had leased the trout fishing for the moderate term of one hundred years, on a beautiful little stream called the "Aar." There is a legion of "Aars" of all sizes in Germany, but this "Aar" is about a yard wide and two or three feet deep.

The stream winds for miles through beautiful daisy-spangled meadows, with here and there a dilapidated mill or moss-grown cottage, and beneath the towering crag, on which is perched the ruins of Hohenstein Castle. The silence and solitude are perfect, for, although there is a main route following the valley about an eighth to a quarter of a mile distant, it is quite concealed by hedges and thickets. The season was the last of June, and the weather intensely hot and dry, so that it was out of the question to look for trout much after sunrise or long before sunset. I waited, therefore, on the day I had fixed upon, until about five in the afternoon, and then, accompanied by the game-keeper or fisherman (without whom no fishing is allowed) drove about half an hour to an old mill with waterfall and pool below, and after "setting up," tried half a dozen flies of all colors and sizes without a rise. After an hour spent in this way trying different pools in the meadows, I took off my flies, put on a small N. Y. trout hook and a dew-worm, so long that I was afraid of it, and let it run down a dozen yards under the long grass overhanging the brook. Suddenly there was a great splashing and commotion, and I had struck something very heavy. Of course there was nothing to do but to reel up, and as the fish dashed up stream the fisherman gently seized the leader, and with his landing net quickly had out, upon the grassy bank, a three-quarter pound trout, the handsomest one I ever saw. The German trout is a little thicker than ours, but *golden* where ours is *silvery*, and with equally beautiful spots. My delight was enhanced by surprise, as I had fully expected to be confronted by the ugly features of a gasping *chub*, which so often rouses the angler's ire. Following the windings of the beautiful stream until drenched with dew and chilled with the night air, I took up my little carriage, about half-past eight, having nine trout weighing from half a pound to a pound, and returned wet, cold and happy, to the "Villa Eugenie." During that night we had heavy showers, followed by a hot, bright day, and I longed for evening to come, as I knew the stream would be in much better condition than yesterday. As soon as the sun was low on the western hills, and the lengthening tree shadows stretched out over the heated buttercups and daisies, I started for my "point of departure," the old mill of "Adolph-seck," hard by the ruins of the castle of that name, placed, as all castles and monasteries of the Eleventh and Twelfth centuries were, upon the most commanding height of the vicinity. I was soon down upon the soft green sward below the mill, eargerly arranging my tackle; but, when after getting in perfect readiness, I looked up for the first time, I was forced, by the surpassing beauty of the scene, to rest for a time in silent, wrapt admiration. Before me stretched the broad green meadow for miles, without inclosure of any sort, the clear, bright waters of the brook, occasionally catching a flash of sunlight in the distance; the side of the valley on the right, rising almost precipitously, and stretching away into dense forest; on the left, great rounded hills or mountains, dotted with groves of chestnut and oak, or crowned with dark forests of spruce and fir, while, about two miles distant, on a broad, bold bluff, stood out the gray, weather-beaten walls of old "Hohenstein," softened and gilded by the light of the setting sun. At my back was the great rumbling old stone mill, black with age, and green with moss and herbage. The last touch of sunlight was quickly gone, and that beautiful moment had come, so dear to all, who love nature and her works—the "twilight hour" of a summers day.

The miller and his men were gazing out of their lofty windows to enjoy the fresh air of the evening after their hard day's work, and to gratify that desire implanted in every human heart to see what "luck" one has in shooting or fishing. I confess to having had a strong wish to show them my transatlantic skill and success; the former, I have no doubt I *did;* the latter, I certainly did *not;* for although with my lightest "tackle" and choicest flies, then grasshoppers, then worms, I whipped that pool from the old stone dam to the tail of it, and two or three less promising ones in the meadow, not a rise could I get while that sardonic German miller and his grinning boys were in sight. Surprised and mortified, I took a small flask of *Brantwein* from my pocket, took a disproportionably large drink from it, and beckoned my silent fisherman from his seat in the grass. After he had followed my example, I put on a large grasshopper and dropped it about forty feet away, into a reach of swift but deep water; before it touched the surface a trout leaped his length out and was hooked, netted and landed in less than a minute. He was fully a pound in weight.

After that the sport was magnificent. The trout were all in the swift water and very voracious. I took twenty-two in all, the smallest weighing half a pound, and the largest a pound or thereabouts; nor did I ever see in that stream a trout weighing less than *about* half a pound. I had observed the same thing in a summer's fishing in Cheshire, England. I never took or saw any small trout, but they "ran" from one pound to one and a half; on the *best* days I took two or three of these; at other times none at all.

I reached the "Villa Eugenie" (so-called for the Empress, who occupied the whole of it one season in the palmy days of the Empire) about ten o'clock, and great was the excitement among my German and English friends at the Hotel de la Poste, opposite, when I sent the fish over for their inspection—it was a very beautiful sight by gaslight.

My friend of the century lease (who, I believe, never caught a trout in his life, although he is a "mighty hunter," and has a splendid collection of trophies, all his own, of deer, bear, rehbock, wolves, foxes, eagles, hawks, owls, etc., etc.), fired by my success, determined to accompany me the next day. He did so, but unhappily we only took five of the smallest eight ounce fish possible, and he would not try them again. I went several times afterwards, taking from five to nine, or ten, and the following August left those pleasant scenes with great regret for the rugged Alps, smiling vallies and blue lakelets of our little "sister" Switzerland, our objective point being the beautiful lake of Geneva. For Forest and Stream.

HUNTING IN THE BLUE GRASS COUNTRY.

DURING the month of November, 1876, I had such an enjoyable week of shooting in Kentucky, that I cannot forbear giving to FOREST AND STREAM a short account of this, my first experience, shooting over dogs, and in a country where it is rare to go a hundred rods without striking a bevy or getting a shot at a cotton tail.

Directly after election, with wife and baby in tow, I left my home in Western New York *en route* for Lexington, Kentucky, via the Lake Shore and Cleveland, Columbus, Cincinnati, and Indianapolis Railways, and by the way, I would recommend these roads to all south and southwestern bound sportsmen, as they are sure to be well treated and their dogs and property safely and properly cared for. Upon arriving at Lexington, which is the center of Kentucky aristocracy, thoroughbred horses, and best of all that genial hospitality that exists no where on earth to the extent that it does in the Blue grass region of Kentucky, I visited with friends a few days, and then cousin Al and I, one fine morning left on the L. C. and L. Railway with a trunk full of Ely Brother's best brown shells, and other paraphernalia in the way of top boots, breech-loaders, shooting clothes and extra loose ammunition bound for Warsaw, a quiet little town on the Ohio river, situated about midway between Louisville and Cincinnati.

Arriving here we were at once at home at the palatial residence of our very dear friend Bob P. After partaking of a spread, the like of which no other house within the scope of my acquaintance produces, we went out to see the dogs, Scott and Frank, a brace of thoroughbred pointers, the former, lemon and white, and the latter liver and white. The sagacious animals seemed to know that we were "on warlike deeds intent," and in their enthusiastic struggles nearly broke their fastenings.

Bright and early Monday morning we were, not afloat, but horseback, and right here let me digress a little and tell you how they beat the ground for quail in the Kentucky bottoms. You must know in the first place that the farms are large, and hundred acre lots are the rule, so three or four hunters, horseback, can beat up the whole width of a field, and a brace of good dogs working ahead will quarter every inch of ground, and the moment they come to a point, the hunters being mounted, can gallop in, hand their horses to the black boy (who always goes along to open the gates, let down the fences, and carry the game, grub and surplus ammunition) walk up the birds and get in thrice as many shots as by the northern way of walking, which the unequal face of the country and the numerous fences necessitates.

This is the way we hunted, and I, a town bred youth, who never strode a horse before, soon vowed I'd rather walk, but as the *edge* wore off I liked it better. Having the largest horse, the black boy rode behind me as tender, and after riding a mile or two I found it was not so nice to have a *tender behind*. O the tricks of this same black boy. Anon his spur-like heels would search out between the ribs of my "Rosinante's," tender spot, and while I was bracing to resist that trot, and holding to the pommel for dear life, this "bull dozed" African would exclaim, "Pull up on de reins Massa H. and make um pace. Go jess like a rockin' chair dem!" I tried it. Give me a camel, a dromedary, a rhinoceros, anything, but please Bob when I come to Kentucky again, don't mount me on old Jane.

Having ridden some distance, old Scott came to a stand beside a drain, on the hillside. Frank came up and backed him beautifully. So perfect was the picture, so statue-like the attitude of the dogs, that I almost feared to get down and break the splendid point, but once on *terra firma* that true sportsmanlike feeling that I am so thankful I possess took possession of me, and with my bran new Remington ready, I advanced toward the staunch eager dogs. When I got to that point where we pause, every second expecting to be surrounded by whirring quails, and wonder which way they will fly, whether it is a bevy or a single bird, &c., &c., I got to quaking in a manner unaccountable to me, and when the bevy arose, and Bob and Al each cut down their bird, I am sorry to say that I never fired a shot. Please bear with me here and take into consideration that I never shot at a bird over a point before. Filled with shame and disgust at this evidence of the "buck fever," it was with a savage joy that I saw Frank come to a dead point, and heard Al say, "Take him H." and I took him, giving him plenty of time and cutting him down clean at thirty-five yards.

Confidence restored, it was "hie on dogs," and at night our well filled game bags, made me think of that delightful book of Frank Forester's "Warwick Woodlands," and the pleasant and successful ending of "Day the first."

The next morning was dark and lowering, the fog hanging in thick masses over the broad bosom of the Ohio; passing steamers were whistling and ringing fog bells, and the general aspect of the weather was threatening. Nothing daunted, however, we started out, and had got but few birds when the rain came down; a trifle discouraged, we turned our horses heads homeward. We had one field to cross before reaching the highway, the dogs were working vigorously ahead, suddenly a point, Al jumped to the ground, bang, bang, away they went, full twenty in the bevy, over Bob and I. The excited dogs, contrary to their training, ran into and flushed another bevy. Both were marked down on a clear grassy knoll. Now we are sure of them. They are packed forty-five strong and an open field to work in. The rain was forgotten and in spite of its pelting, we stood almost in our tracks and bagged twenty-six birds in forty minutes.

The next day we rested and feasted on roast turkey, broiled quail and rabbit. They have a tradition along the river that the man is not living who can eat a quail a day for thirty consecutive days, but I exploded this theory by convincing them that I could eat thirty quail in six days. (I guess it was about that many) which is a feat of gastronomy worth recording.

A day or two more, or rather parts of days, were enjoyed by us shooting. I can never forget those jolly times, the morning ride, the quick emptying of saddles when the "game's afoot," the noonday lunch beside the spring, the fragrant breath of "Vanity Fair," the after dinner shoot, and then the canter home, where dinner waits, and in the evening the pleasant task of wiping out our guns, and reloading shells and then a reading of some pleasant story, a song, a parting pipe, a pleasant healthy sleep, and to the field again.

After a year's confinement to business there is nothing that so tends to enlarge a man's ideas and chest, as a free roaming over hill and dale with dog and gun. Providence permitting, another fall will find me on the old Kentucky shore, ready for business, and to the readers of FOREST AND STREAM, who enjoy good quail and rabbit shooting, I would say that back of any of the river towns from Covington to Louisville they can find it in abundance, and the contiguity of this region to towns, enable shooting parties to find good board at reasonable prices, and all the little indispensibles of shooting, thereby saving the importation of large quantities of ammunition, provisions, etc. The people are hospitable and one experiences very little trouble in obtaining permission from the farmers to shoot on their premises. I saw but two signs, "Posted" during my trip. A few ducks can be found on the rivers in November, but February is the month for them.

Our bag for parts of four day's shooting scored as follows: Eighty-six quails, twenty-three "cotton tails," three pigeons and one teal. Not a pot-hunters bag, to be sure, but enough to elicit plenty of sport, and an insatiable desire to "do some more." H. W. DeL.

AT HOMOSASSA, IN FLORIDA.

PHILADELPHIA, February 7th.

EDITOR FOREST AND STREAM:—

Failing health compelled me last fall, to seek a short season of rest and out-door recreation. Of course, at this time of year, Florida was the objective point to which our thoughts at once turned, and as a dozen visits since the war had familiarized us with the St. John and eastern coast regions, we decided to explore the Gulf coast. Having seen occasional reference in FOREST AND STREAM to Homasassa, we determined to visit it, and accordingly left New York on November 23d, on the "Carondolet." We made a pleasant run of three days to Fernandina, starting the next morning by train, for Cedar Keys, at five o'clock, and were enabled by good luck to make the entire distance—one hundred and fifty-five miles—in thirteen hours! At the Keys we found very fair accommodations at the Gulf House, and during the six days we were detained here by a severe norther, experienced the proverbial hospitality of the inhabitants. We were as yet undecided as to what place we should make headquarters, and had almost concluded to accept the kind invitation of Captain Willard and Major Roux to visit Sarasota, when we came across the article of "Al Fresco," entitled "A Sportsman's Paradise," in a copy of "Camp Life in Florida," loaned us by the Editor of the journal. This settled the question at once, and after waiting five days for the advent of the

"Spray" and Mr. Jones, on the sixth we took private conveyance, only to pass them on the way.

At Homosassa we spent a month, the memory of which will linger many a day. We found it all that "Al Fresco" has described and more. Though wandering for many years in many climes, it was never before our good fortune to combine at once, in the same place, the finest sporting and the comforts of a refined home. Though rather early in the season for ducks, there were large numbers of them in Salt river and some of the back creeks, affording good shooting. The sheepshead fishing was very fine, and whenever we could prevail on "Fifteenth Amendment Dick," who still flourishes, though rather in a dilapidated and indolent style, to bring us two or three crabs for bait, we were quite sure on the ebb tide of a hundred pound or more of splendid fellows at the Sheepshead Stake.

Some of our family found excellent sport with the fly, and devoted most of their time to that amusement. No less than seven kinds of fish took the common trout fly freely—black bass, sea trout, skip jacks, channel bass, cavalli, snapper and bream; and it would be well for any one intending to visit this locality, to provide themselves with a good trout rod and an assortment of flies. We also found the trolling excellent, and for this sport think no spoon equal to the largest sized Buel, of Whitehall, New York.

Christmas was spent at Thompson's, on the edge of the Big Hammock, and on the day succeeding a grand deer hunt, with hounds and on horseback, was organized for our benefit. A more exciting and delightful day we never experienced, and a goodly number of deer and turkeys rewarded our efforts. Game of all kinds is very abundant here, and the Hammock dry, open, and in every way the finest ground for hunting we ever went over. Certainly not less than fifty deer were started up during the hunt.

At leaving, which we were compelled by circumstances to do much sooner than we desired, we felt that we were parting from old friends and home. Often do we recall those delightful evening circles after dinner, in the sitting-room—the open fire-place piled high with fragrant red cedar logs, the piano responding to the skillful touch of Miss R., some reading, fly-making, or planning expeditions. How happy we were when we retired to our snowy beds, to dream of home and loved ones, and huge piles of snow and ice; nor yet those luscious oranges, and those delicious buckwheat cakes, which, molified with Florida syrup, we used to punish so each morning. But all things must have an end, and one fine day we found ourselves back in Philadelphia, brown as a nut, twenty pounds the heavier, and with an appetite and digestion able to cope with—well, almost anything. Long may you wave, dear Homosassa. W. H. L.

Fish Culture.

ABSTRACT OF THE REPORT OF THE COMMISSIONERS OF FISHERIES OF THE STATE OF WISCONSIN FOR THE YEAR 1876.

THE amount appropriated for the uses of the Commissioners last year was $10,000, and the Commission was reorganized by adding to it Mr. H. F. Dousman as a member, and the Governor also as a member *ex officio*. After organizing the first duty was to purchase a site for a Hatching House. After a full examination of those offered, the Commission, with entire unanimity, selected the grounds known as the "Nine Springs," in the town of Fitchburg, on section 3, and located about three miles southwest from the West Madison depot. It is claimed for this that it cannot be excelled by any of the States provided with Commissioners. The number of springs, the fall, and their close proximity to each other, are all that could be desired. There is an abundance of water, pure and cold, and the fall in some of them upwards of twenty feet, is such that there is no danger from surface or back-water. The Commission did not require the quantity of land purchased, but were compelled to take the tract in order to secure the springs. Private parties would gladly have taken the purchase at a much higher figure than that paid by the State, and to be used for the purpose of fish culture. Its adaptation to such purposes is all that could be asked.

The hatching houses, tenements, etc., were all immediately built and equipped, and a temporary hatching house established at Milwaukee for the hatching of spawn of the white-fish and lake trout; the authorities of that city having very kindly granted adequate space in the water works for that purpose. The propagation of the white-fish must always constitute the leading object of the Commission, and the stocking of Lake Superior, Lake Michigan and Green Bay, will be kept steadily in view. The hatching house at Madison, is designed exclusively for stocking inland lakes, rivers and streams with the varieties of fish suited to their waters.

The hatching house, of which Mr. D. Comstock was made Superintendent, has a capacity of 1,000,000 salmon eggs and double that number of brook trout. In October 36,000 California salmon ova were placed in the troughs, and upwards of 90 per cent. of strong healthy fry hatched. For breeding purposes the Commissioners have in their ponds 2,000 speckled trout over two years old and averaging half a pound each. Over 100,000 eggs have already been taken from them. The ponds also contain 600 California salmon one year old, 1,000 Penobscot and 2,000 land-locked salmon, all intended for breeders.

Referring again to the site selected the Commissioners think, all things considered, that they have a very superior situation for their purposes, and one of the very best of hatching houses. The Madison lakes are among the finest bodies of inland waters in the northwest. The springs upon which the buildings are located empty their waters into a large bay lying north of Waubesa and Second Lake, and with that bay, the entire chain of lakes of the four lake country is connected. From the hatching house springs and without ever taking the fry from the ponds in which they are bred, they can stock nearly 21,000 acres of water. Being equi-distant between Lake Michigan and the Mississippi, with the railroad facilities at hand, they can easily reach all the settled parts of the State, and find ready access to their inland streams and rivers and almost numberless lakes. For the most part these streams and lakes are adapted to the habits and wants of great varieties of food fish, and when properly stocked in connection with the other inland waters of the State must materially increase the food resources of the people with a most healthful article of diet.

The Commissioners have placed in working order, twenty of the Hatton hatching boxes, with a hatching capacity of 10,000,000 white fish eggs, and now have in them, in process of hatching, upwards of 7,000,000 of the white fish spawn. There are also twenty-four troughs, twelve inches wide and sixteen feet long, with a hatching capacity for nearly 4,000,000 salmon trout spawn. They have now in these troughs nearly 3,000,000 of the eggs of the trout. The spawn of the white fish was taken at Detroit river, Escanaba and Sangaton, and those of the trout at Milwaukee. By combining with other parties they were enabled to greatly facilitate and forward their own labor. The following named gentlemen co-operate with the Commission in the taking of salmon trout eggs, and secure the number named: N. K. Fairbank, for Geneva Lake, 600,000; B. T. Shaw, for State of Iowa, 900,000; G. H. Jerome, for State of Michigan, 1,000,000; Seth Green, for the State of New York, 500,000.

The Commissioners are now maturing a plan for the distribution of fry by which every portion of the State will be dealt justly by. In the distribution of the fry of the speckled trout, and which is confined to local streams, they have adopted the rule that in all such cases the owners of the land through which such streams run, must, in order to obtain them, give a written permit to the public to allow the trout to be taken, subject to the fish laws of the State. This precaution will remove all causes of complaint on the score of partiality. Of this variety of fish they hope to have large numbers for the season of 1877.

The Commissioners complain that with the different Legislative enactments and the power conferred on counties to regulate the taking of fish, it is difficult to determine what the law really is. They hope this winter to secure a better understanding in this matter, in order that laws intended for the protection of fish may be more generally understood and more efficiently enforced. A brief resumé of the operations of the U. S. Commission and those of other States is given, with statistics showing what has been and may be accomplished. An appropriation of $10,000 for the current year is asked for.

CARE OF YOUNG TROUT IN THE HATCHING-HOUSE.

NUMBER TEN.

Continued from April 27th, 1876.

WHEN first disengaged from the egg, the young trout presents a singular uncouth appearance. It is only a fish in outline, and really but partially hatched. A thin translucent line three-fourths of an inch in length, one end pointed, the other grotesquely knobby and irregular, furnished with two unseemly eyes widely distant, compose the body of the fish. Attached to half the lower portion of the hatching, from the throat backwards, is an unshapely large transparent bag covered with a delicate network of blood-vessels, through which the vital fluid may be seen coursing towards a diminutive red speck—the heart of the tiny creature. No traces of fins are to be seen, except the pectorals, save a cartilaginous fringe which extends backwards from the middle of the back, over the caudal extremity, thence forward beneath, to a union with the sac. The gill covers are wanting, and four lines on each side of the neck, outline the future gills. The movements of the fish are slow and exceedingly awkward, borne down as it is by this singular appendage, answering to the umbilical vessels—better known as the yolk-sac. The teeth are wanting and the mouth is low down underneath, and slowly gains its normal position at the extremity of the head. The yolk-sac, that might seem at first an unnecessary burden, is of vital importance physiologically, for it contains nature's supply of nutrition sufficient for two months of metamorphic life, when it is absorbed and disappears. During this period, the hatchling requires no other food, nor will it accept of the most tempting morsel, while this provision of nature continues to supply every want. The fish conscious of its defects, is shy and retiring in its habits, seeking refuge beneath objects, keeps out of sight—desiring only seclusion. The duration of this metamorphosis is about fifty days. While this singular period of existence is going on, if we possessed no knowledge of the origin or ancestry of the fish, we would be at a loss to know to what family it belongs, for it has no resemblance as yet, to the world-renowned, and royal race, of which it is a veritable member. Just at this point, we may observe, that this strange physical phenomenon, as exhibited in the yolk-sac, indicates a striking relation between parent and offspring, analagous to that which exists in the mammalia, which is manifested in another mode, after birth, by nursing. In the light of embryology, the vitelline membrane of the egg, in comparative anatomy, and in comparative physiology, answers in structure, and in function, to the chorion of mammals. This peculiar investment, which begins so low down in the series of animal life, and in vegetable life too, forms a diagnostic feature of each individual pieces in each link of the ascending life's chain, from monad to man, which so materially aids the biologist in elucidating and explaining more clearly the marvellous processes connected with the evolution of species, life force, the multiplication and development of cells, and many other obstruse problems of animal existence. Fish culturists have favorable opportunities for investigations in this grand field. It is only just entered, as it were, by the ploughshare of science, and in the near future many important developments will be made for the benefit of pisciculture, as well as for zoology generally. At this stage of fish-life, the labors of the fish farmer are indeed burdensome, and from this period, onward to the time of the transfer of the fry to the pond, there is no rest. Daily the troughs must be carefully examined, and all dead fish removed, for at this period many will surely die. The bulb syringe here becomes a useful instrument, already spoken of in a former chapter. Attendants should be provided with convenient microscopes the pattern used by watchmakers, confined to the eye, by a rubber band around the forehead, to avoid the perplexity of holding it before the eye when in use. It is indispensible in detecting dead fish, or any deleterious substances lying among the gravel. This period is truly a critical one, and untiring energy is the only precursor of success. The mighty scourge of the pisciculturist is the *byssus*, a word from the Greek, signifying thread like, hairy, or filamentous, a fungous which attaches to dead or unfertilized ova, and is also found in connection with the fish of the troughs. The imperfect gills of the young fish require the constant motion of the pectoral fins to aid the feeble respiration, and there filaments of the fungoid growth, too minute and delicate to be seen by the unassisted eye, become entangled in the gills, and respiration being impeded, the fish dies. Hence much labor is required, as well as constant watchfulness, to prevent the too frequent catastrophe of loss of labor, by loss of stock. While the weeks, mingled with intense anxiety, are passing away, the fishes are perceptibly, being transformed, and are increasing in size, but the constant watchfulness already inaugurated must continue to the end, if complete success is expected to be attained. At the end of fifty days the unsightly fish is transformed into a more perfect image of its kind, and takes its place as an important member of the great animal kingdom among a long line of noble ancestors. We now come to the food problem which has been so much discussed by fish farmers.

Sandwich, Ill.

FISH CULTURE IN CALIFORNIA.

EDITOR FOREST AND STREAM:—

This useful and flourishing association of men, who wish to encourage the preservation of our game and fish, and who are looking sharply after the infringement of the laws of our State, and to punish all offenders, hold meetings once a month, and continually new members are being added to the society. The law making a close season between August 1st and Nov. 1st has been well enforced, and with the result that further prosecutions for violations will probably not be necessary for the future. Careful observations for a long while have convinced us here that the salmon is to be found in our rivers and bays every month in the year, which does not take place, I believe, in any other part of the world.

Our Fish Commissioners, notwithstanding the small allowance from the State, which is only $1,500 a year, and which should be more than twice as much, have acted with much zeal, perseverance and good judgment. The planting of shad in the Sacramento river is likely to prove in a year or two more a complete success, as numbers have been caught in nets set for other fish at various points on this coast.

During 1876 the Fish Commissioners have placed 125,000 young shad, in good condition, into the Sacramento river, near Tehama. Every year they are stocking our rivers with young salmon by the million, and the good effect of this measure is now being experienced every winter in our bay by the great numbers of them, which are taken by the anglers at Long Wharf, Oakland, near our city. One hundred and fifty thousand whitefish eggs are being hatched at Berkeley, a suburb of Oakland, opposite San Francisco, where our State University is situated. The eastern trout eggs have been hatched out and placed in mountain streams. These fish have grown and thrived well, a large number having spawned.

The new species of trout called the Dolly Varden, which have been found, we think, the last four years in some of our northern streams, will be distributed next season throughout the State. They inhabit chiefly glacier waters. They have yellow spots just below the back, and red spots above the belly, and are quite handsome, but not so brilliant as the eastern or European trout. They have lately been found to inhabit Alaska. The name of this fish is *Salmo Campbellii* in pisciculture.

We expect also to propagate the grayling in California the coming season. It is said to be the most beautiful fish in American waters. These will be placed in our coldest streams of the Sierras. The Schuylkill catfish lately planted have largely increased, and been largely distributed throughout the State. The Mississippi catfish placed in the San Joaquin river have also done well, a number weighing from three to four pounds having been taken at various times. The black bass in Napa and Alerreda creeks have largely increased in number. Lobsters will be again attempted soon. E. J. HOOPER.

FRESH WATER SALMON IN PENNSYLVANIA.—We are getting gradually some very important information respecting the culture of the *Salmo Salar* in land-locked fresh waters. In the letter below, friend Thompson mentions facts which are worth more than a passing notice, for they bear very much upon the question whether the land locked salmon of Canada and Maine are the true salmon, or merely a variety of trout. In Mr. Thompson's case we have veritable salmon which were obtained from both fry and ova, so that the question of identity no longer forms any part or feature of the investigation. What we really have, beyond doubt, are true salmon, that have not tasted salt water for five years, and are impatient to make sport for the angler:—

NEW HOPE, Pa., February 10th.

EDITOR FOREST AND STREAM:—

Your correspondent, "Nouvelle," has his salmon in too deep water for me at present, as I am not aware at what age they become adults, and I have none yet that will turn scales at twelve pounds. When I was struck with salmon on the brain, I was told by several professors, who have

published works on fish culture, that it would prove a failure, as it had been tried in Europe, and they invariably died the second year. Mr. Ashworth was also quoted as authority. For the benefit of those who have the patience and wish to experiment with salmon, I will say we have an artificial lake which covers fifteen acres, with a depth of water from seven to twenty-three feet, which is well stocked with salmon (Salmo Salar), some now in their fifth year. Last season a single rod could, with a fly, take one hundred pounds in a day. There is another pond which I stocked three years ago, where they have done well. The salmon have been breaking very lively for the last few days, and expect soon to have some fine sport.

JAMES B. THOMPSON.

—The annual Convention of the American Fish Culturists' Association is in progress (Wednesday and Thursday, 14th and 15th,) at the Aquarium, corner Broadway and 35th street.

Natural History.

PHILADELPHIA ZOOLOGICAL SOCIETY.—We have just received the Fourth Annual Report of the Board of Directors of the Zoological Society of Philadelphia, and have carefully perused it with much pleasure and profit. From it we learn that the Society is financially in a most flourishing condition, a state of things on which we desire to offer our hearty congratulations.

The most important fact of scientific interest derived from the Report is, that all the animals which die are examined by the Prosector of the Society, the cause of death ascertained, and steps taken for the prevention of similar diseases in the future. If this plan be followed up, as no doubt it will be, we do not see any reason for doubting that ultimately the mortality among the collection may become merely nominal, or at least no greater than occurs among the domesticated animals of this climate.

The skeletons of the animals which die in the Gardens are deposited with the Philadelphia Academy of Natural Sciences, or the University of Pennsylvania, and we quite envy those institutions the rare and desirable specimens that they thus obtain.

The Report contains a long list of animals added to the collections during the year ending March 1st, 1876, many of the names of which will be found in the current numbers of FOREST AND STREAM. Why is it that we cannot have as large and flourishing a Zoological Society in this city as they have in Philadelphia? Will not some of our wealthy citizens take the matter in hand?

THE BUTCHER BIRD.—A correspondent, W. C. S., writing from Towanda, Pa., sends us the skin of a Butcher Bird, *Collurio borealis*, saying that the species has been unusually abundant in his vicinity this winter. He compares the flight to that of the English Bullfinch, and speaks of its being common in the south of England in some seasons. Mr. S. notices, as do almost all our correspondents, the havoc which this species makes among the English sparrows.

Fred. H. Keys, of Springfield, Mass., relates the following incident:—

A fact came to my notice yesterday, which brings the Butcher bird (*Collurio borealis*) out in a new light. I was sitting in my window watching one which had been hanging around the house for a day or two, when it suddenly darted out of sight and returned with an English sparrow in its bill. Carrying the victim into the top of a tall tree, the shrike proceeded to impale it *alive*, which it accomplished by tearing the bird with its bill, and then balancing itself struck it, the sparrow, violently against the point of a twig until it was securely fastened. Then the Butcher bird danced around pecking at it, and kept flying from one tree to another, returning every little while, the sparrow endeavoring desperately to free itself. I don't know how much longer the torturer would have kept up his cruel sport, for I loaded up and shot him. Hoping the incident will be of interest to some one, I remain yours truly,

FRED. H. KEYES,

—We have received from our correspondent G. C. E., of Jackson, Miss., the following note of the capture of a large eagle in Northern Mississippi. As it is spoken of as a Gray Eagle, we presume that it was a young *Haliaetus leucocephalus*. The span of its claws is said to have been eight inches, and its talons measured about two inches in the chord of the arc. It was killed by a Mr. Towry near Smithville, Miss. "When found by Mr. Towry it had killed two of his hogs, and was dining on one of them. When approached it gave no sign of intimidation, but on the contrary was disposed to fight, and made signs in that direction. The same bird, or a similar one, was seen in the same neighborhood two years ago. This eagle was of the gray species, and measured from tip to tip of wings seven feet and four inches; three feet and eight inches around the body, and fifteen inches between the wings."

As suggested by our correspondent the eagles of Mississippi don't seem to intimidate "worth a cent."

A SUPPOSED NEW FISH IN LAKE CHAMPLAIN.

The following interesting correspondence has been handed to us by the Hon. Robert B. Roosevelt, N. Y., State Fish Commissioner:—

EDITOR FOREST AND STREAM:—

I send you an account of the new fish discovered in Lake Champlain, and suggest that it may be the Long Island pickerel—the *esox fasciatus*, as we used to call it, and which may still be its name unless the scientists have discovered a new one. It is hard to form an accurate conclusion from a verbal description, but the fish is clearly of the pickerel species, and accords in many particulars; in fact, I may say in all particulars, with our handsome, toothsome, graceful, but ill-mannered pickerel, which grows so readily, and devours frontlings so voraciously in our preserved waters of Long Island." Manifestly it is not a trout, nor any cross or modification of a trout; it has not the adipose dorsal fin, and its single dorsal is opposite the anal. No cross between the pickerel and the trout families is possible. Still, I do not know, how this pickerel journeyed from Long Island to Lake Champlain, and having none of my ichthyological books at hand, I cannot say whether the *esox fasciatus* was previously known in Lake Champlain. Very respectfully,

ROBERT B. ROOSEVELT.

AU SABLE HOUSE,
KEESVILLE, N. Y., Feb. 6th, 1877.

HON. ROBT. B. ROOSEVELT:—

DEAR SIR—I noticed some months ago a rumor in our local press that a new fish had appeared in the waters of Lake Champlain, and they were generally assumed to have originated from some of the fish which had been introduced into the lake by the action of the Government. Ill health prevented my investigating the matter. A day or two ago Henry O. Talmadge, M. D., brought into my rooms a small box packed with fish in ice, which he was about sending to Mr. Seth Green. I will premise that my friend Dr. Talmadge is an ardent disciple of Isaac, and is also possessed of many scientific acquirements on the subject; that he is a highly eminent surgeon, while I am no fisherman, assert no science in ichthyology, and only regard this subject in its utilitarian aspect, and in its relation to political economy. He informed me that a man appeared in the streets of the village Saturday selling a large sleigh load of the novel and beautiful fish, of which he afterwards gave me the description annexed:

Length of specimen, 8 inches; color, bluish silvery gray mottled with dark, irregular chocolate blotches down the sides, but more distinct above the medial line; the head smooth, depressed, dark brown color, scaleless, an i about one quarter length of the body; body covered with minute scales; one dorsal fin; anal fin opposite the dorsal; eyes full; pupil black; iris yellow; under jaw slightly projecting; mouth wide; palate bones and jaws studded with sharp incurved teeth; pectoral, ventral and anal fins of scarlet color, edged with white; tail dark chocolate brown, forked.

The man first pretended that he had taken them in the Wilderness lakes, and that they were a cross between the *pickerel* and the *trout*, but he afterwards admitted that he had taken them in gill nets at the mouth of the Au Sable river. We found on inquiry that immense numbers of the fish are thus captured along the whole circuit of the lake. The specimens I examined were laden with spawn, which Dr. T thinks would have matured about 1st of May.

These are undoubtedly a novel fish to our waters, but there is a conflict of opinion whether they are the progeny of the fish planted, or whether they are immigrants reaching us in their peculiar eccentric movements which sometimes characterize some families. I have already written to Prof. Baird on the subject, and sent him the original of the annexed paper. I have had intimate relations with him on this subject, and he has ready for his report an elaborate paper of mine on the Salmon History of the Champlain waters. I modestly suggest that my friend has omitted many marked features in these fish—the absence of the large dorsal fin, and that the sides are strangely mottled or streaked with vertical marks, and the intensely scarlet of the fins, and I doubt the presence of any scales. He remembers that when I saw them their natural rich coloring had faded, but they were still a most beautiful fish. Henry N. Hewitt, Esq., a gentleman of cultivated taste, and with much science and observation on the subject of fish, and moreover the happy possessor of a work on fishes, which formerly belonged to the library of Daniel Webster, after reading Dr. Talmadge's description, rather dissents from the general conclusion that these fish belong to the trout family, and inclines to the opinion that they are a new and delicate variety or species of the pickerel family. If so they are certainly equally superior in every quality to the coarse northern pickerel with which we are familiar, and may justly claim protection. Those who have eaten of these fish pronounce them as revealing the peculiar delightful trout flavor.

In either view, whether these fish have been produced by the fish and introduced, or are migratory bands of a new and valuable kind, it is important that this vandalism should be made to cease, and that the spoliation of these waters by the atrocious gill nets should be arrested.

Popular feeling has been much exasperated, and the menaces of arrest and persecution may, for a period, stop these practices; but such effect will only be transient, and the proverb truly says: "What is every body's business is nobody's." I have decided, therefore, to address you, understanding, as I do, that you are at the head of the appropriate organization.

I offer no apology for troubling you with this long narrative, for I feel afraid it will enlist your interest and consideration.

WINSLOW C. WATSON.

[We would be extremely obliged to any one who will forward us a specimen of this fish.—ED. F. & S.]

STRIPED BASS OF THE MISSISSIPPI AND TRIBUTARIES.

ST. LOUIS, MO., Feb. 3d, 1877.

EDITOR FOREST AND STREAM:—

After publishing my letter of January 13th, in which I enumerate the striped or rock bass as an habitat of Murdock Lake, you ask if our correspondent is right about the striped bass being caught in the said lake. It has been many years since I lived at the East, and contiguous to points where we saw, and caught, the regular striped bass, but so far as my recollection goes, those taken at Murdock, are similar in every respect, though not so large in size. I have never seen one taken there, that would weigh over two pounds. Whether these are the Simon pure or not, I am unable to determine, but they are a game little fish, and of splendid flavor. Perhaps when the Ocean, and Murdock Lake varieties are placed side by side, there would appear perceptible differences in the two. It may be that during the great flood and consequent overflow of the Mississippi river some years ago, these xplorers from the Ocean were caught by the receding waters and imprisoned in the lake, and being thus cut off from their favorite and natural element and feeding grounds have become dwarfed and stunted in growth. I have seen the true shad taken as high up the western waters as in the vicinity of Cincinnati on the Ohio river, and also at a point just below the mouth of the Ohio. Why not find striped bass as far from home? If I succeed in capturing one at Murdock this spring I will forward it to you, when just as likely as not it will prove no striped bass at all. DICK.

JACKSONPORT, Ark., January 30th, 1877.

EDITOR FOREST AND STREAM:—

You ask in a recent number, if it is possible that striped bass are caught in Moredock Lake. In the lakes of this region there is a fish described by Norris as "broken stripes" or broken striped bass, which usually weighs from one-quarter to one-half pound. There is in White river a striped bass, a genuine game fish, weighing from one-half to three pounds. This fish is caught with minnows and spinning bait; is a good pan fish, and only resembles the striped bass or rockfish of eastern waters in external appearance. These fish, together with the black bass, are now biting like dogs. YELL.

THE BASKING SHARK IN THE PACIFIC.

SYRACUSE, N. Y., January 18th, 1877.

EDITOR FOREST AND STREAM:—

The "Basking Shark," mentioned in your issue of January 11th, I judge from the general description to be identical with the "Bone Shark" of the Pacific in the whalemen's nomenclature. I have seen the fish in the South Seas and on the coast of Africa. Whale ships do not pursue it as a matter of real business, but merely take it in, if it comes along in the course of a "dry season," just as they would a fin back or sulphur-bottom; although either one might run away with a whole rope-walk of their line. It should hardly be termed a "shark," being a big, shapeless nondescript, without apparent carnivorous propensities. The "liver" (so called) constitutes the greater share of its bulk. "Beach Combers," who can beg or borrow, or even worse, steal a brace of whale boats with the accompanying "kit," will run out for a two or three day's cruise, and pay expenses from proceeds of a few of these sea monsters.

The Bone Shark of the Pacific is usually harpooned on soundings at the surface of the water, from which fact, I presume, it is given the name of "Basking Shark." In 1861, Dr. Willis Bailey, of Baltimore, then United States Commissioner and myself, while sailing in an open boat from Tumbez to Guayaquil, in the South Pacific, were nearly swamped in a comparatively still sea, by running on the back of one of these fish, which happened to come to the surface in advance of our boat. Fortunately for us, it did not kick or splurge—merely settled away gradually into the blue depths. I have seen them frequently sunning or basking on the sea, but never saw or heard of their being assaulted by any other marine monster. From this, I credit it with some latent means of defense, as, barring size alone, I think it the most inoffensive looking thing that swims in salt water. In 1859 I saw some forty barrels of Bone Shark oil shipped to Callao, Peru, all taken in a week by a small coasting schooner. In this case the fish were harpooned, towed ashore, and "tried out" on *terra firma*. Only a few ran over two or three barrels each.

The quality of oil is not equal to the average of whale, but rules in price about as black fish or hump back oil. Aside from the head, the bone is about all in the back and fins. It has no solid ribs nor underpinning.

From Mr. Harvey's communication, I see that the devil fish and great "squid," as well as Basking Shark, are found off Newfoundland. I have seen them all in the warm waters of southern latitudes, but have never previously known they were found so far north. Can naturalists say if their ocean house is so wide, or, if they are only migratory, like the sperm whale at different seasons, for food or breeding purposes. E. R. WILSON.

The Basking Shark is found throughout the Arctic temperate and tropical regions of the ocean, and the same is true of the *Tenthidæ* or Squid family.—ED.

THE CANADA GOOSE.—Referring to the wild goose, or Canada goose, a valued Canadian correspondent writes us as follows:—

"My uncle, the late Lord Coventry, had a flock of them at Croome of over 400 for years, and there are some there now. They bred regularly, but I never saw any crossed with the tame there, although I have in this country. Their flesh became worthless, owing to the artificial river having very little current, and foul weeds being plentiful; at least I suppose that to have been the cause. They were quite tame."

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE WEEK ENDING FEB. 10TH.—One blue and yellow macaw, *Ara ararauna;* one snowy owl, *Nyctea nivea*, presented by Mr. Anthony Butler, Jr. Captured on Staten Island; one snowy owl, *Nyctea nivea;* presented by Mr. M. V. Caffrey, captured in New Jersey; four Wagler's parrakeets, *Conurus Wagleri*, purchased; one yellow fronted amazon, *Chrysotis ochrecephala*, purchased; one red-vented parrot, *Pionus menstruus;* two wild pigeons, *Ectopistes migratoria*, received in exchange; one fox colored sparrow, *Passerella iliaca*, presented by Rush C. Hawkins, Esq., N. Y. City; one horned owl, *Bubo virginiana*, presented by Mr. Patrick O'Connor, N. Y. City. W. A. CONKLIN, Director.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS FEB. 6TH.—Fifteen *Tylon niger* and nine *Salamandra bilimater*, captured by keeper; one weeper capuchin, (*Cebus capucinus*), presented by C. P. Lunnell, Georgetown, Del.; three white-haired porcupines (*Erithyzon dorsatus*); four *Menebranchus maculatus*, five blue jays (*Cyanurus cristatus*); one sparrow hawk, (*Falco sparverius*); one Cooper's hawk, (*Accipiter Cooperii*), purchased; one fowl (cross between red-shouldered turkey and guinea), presented by Hon. S. B. Conover, of Florida; one buzzard, (*Buteo lineatus*) presented; one screech owl, (*Scops asio*) presented by J. G. Hand, Philadelphia; one great horned owl (*Bubo virginianus*), presented by H. S. Thompson, Indiana, Pa.; one common rabbit, (*Lepus curriculus*) presented by J. H. Barry, Philadelphia. ARTHUR E. BROWN, Supt.

HUNTING IN BERMUDA.—We have never heard that there were foxes in Bermuda, and yet there is a Hunt. Judging from the report of a run which we find in the *Royal Gazette* it must be something in the nature of a paper chase with a member of the Hunt as fox. Colonial life would be intolerable to Englishmen were it not for such resources as the above, together with "fives" and cricket, and a little shooting in the season. The advantages which paper chasing enjoys, however, is, that the ladies of the colony can in a measure participate. The meet is advertised, and the line frequently so planned that by following in their pony wagons they can see most of the run and be in at the finish. The following paragraph shows how the thing is managed:—

"To add to so pleasant a run Col. Bennett and the officers of the 46th extended a welcome hospitality to those who had assembled to witness the finish, and provided an agreeable surprise for their guests by suggesting the idea that advantage might be taken of the band being present to join them in a dance or two. Amusement may be scarce in Bermuda, but few countries can boast of such a combination as a capital run and an impromptu dance at the end of it. If this is not the height of enjoyment we should be sorry to have to cater far those who disagree with us in this opinion."

Woodland, Farm and Garden.

THE GLADIOLUS.—Those who expect a fine display of Gladioli next summer have doubtless had the ground roughly dug over last fall that it may be thoroughly mellowed and sweetened by the winter's frosts, and as the season is now approaching for planting they are doubtless looking over their stock of bulbs, and anxiously scanning the new catalogues as they receive them to find out what new and really good varieties—*varieties new and really good*—they require to make up their selection. A few hints as to cultivation and varieties is therefore not unseasonable. In order to secure an effective display, and at the same time afford the plants an opportunity of fully developing the beauty of their flowers, it is advisable to plant them in rows about eighteen inches apart and one foot between the bulbs, placing them at least three inches deep. Planting may be commenced as soon in spring as the soil is fit to work, and to prolong their season of blooming into the fall they may be planted at intervals of two weeks, until the middle of June, when the plants are sufficiently high they should be tied to stakes, as, if they are not properly supported, the wind is apt to twist them off close to the bulb, and then receive a good mulching of half-rotted manure spread over the surface. In dry weather frequent sprinklings overhead and good surface waterings will be desirable, though the dressing of manure will do much to keep the soil moist and cool. Occasional waterings also of liquid manure will be found beneficial as soon as the flower stems begin to show. For flower garden decoration they may be planted at intervals of two weeks in clumps of three or five in the borders or flower beds or in masses in large beds, or between Rhododendrons, Azaleas, etc., thus lengthening the season, and adding an additional charm to these groups, which though lovely when in bloom are dull enough looking during the rest of the year. Most cultivators of the Gladiolus like to try their hand at raising seedlings. This is not a difficult matter, as seed is freely borne and ripened, and should be saved from the best varieties only. It may be sown early in April in pots or boxes, or later, in the open ground, in a frame or some place where it can be shaded from the noonday sun, and when large enough to handle may be transplanted about three inches apart, or what is probably as good, and much easier, left in their position till they ripen off in the fall, and then carefully taken up and replanted in the spring. A large number of these seedlings will flower the second and third year. The taking up and storing the bulbs in fall is of considerable importance and should not be delayed too long, care being taken to dry them gradually off, and have them cleaned and the varieties put separately in proper bags, and placed out of reach of frost. In addition to many of the older sorts the following are fine in quality and distinct in character, viz.: Ada, salmon red, white throat; Coronet, bright red, the throat flamed with white; Distinction, orange rose, purple throat; Grandeur, blush, flaked with carmine, extra fine; Julia, pink suffused towards the edges with carmine and very purple flakes, very fine; Lord Derby, bright crimson; Medina, flesh color flaked with violet; Miss Warren, cerise with white throat, very beautiful; Modesta, crimson shaded with maroon, very fine; Pluto, orange scarlet yellow throat, very striking; Prince Arthur, white flaked with orange purple; Robert Fortune, carmine flamed with crimson; Sybil, canary orange, throat striped violet; Virginalis, pure white, bordered and flamed with rose; and Volano, dark rose flaked with a darker hue, pale throat. The C. L. Allen Co., Queens, L. I., and George Such, South Amboy, N. Y., have made the culture of the Gladiola a specialty, and their grounds in the summer season are ablaze with thousands of these gorgeous varieties.

GRAPE FRUIT.—In the delightful orange grove of Alfred P. Jones, at Homosassa, Florida, are thirteen varieties of the *Citrus* family, if we are not mistaken. Among these the most delicious of all, to an acquired taste, is the grape fruit. Its designation is a misnomer, for there is no analogy between it and the fruit of the vine. Grapes grow in clusters on a climbing plant, but the grape fruit hangs in huge golden spheres from the branches of a tree of large size, and both the tree and its fruit have the general characteristics of the orange. The leaves, however, differ somewhat in shape, the orange being smaller and more pointed, while the grape fruit is not only yellower, but it often attains a diameter of six inches. The skin is thin, the vesicles or juice cells larger than those of the orange, the flavor sweet, with a slightly bitter taint, and the fruits altogether more satisfying than the orange. It yields 30 per cent more juice than the orange. The taste for them has usually to be acquired, but those who become fond of them will always take them in preference. We have seen them growing in the Homasassa grove, and the other day friend Jones forwarded us a box, which none can appreciate more than we. Although large, like the Shaddock, they scarcely resemble them in any other respect than size, and we see no reason why a market could not readily be created for them here at largely remunerative prices, say 25 cents each, at retail.

Each specimen of the fruit contains about thirty seeds; the orange usually has fifteen. Grape fruit do not decay more rapidly than the orange, and are more easily propagated.

—The regular monthly meeting of the Horticultural Society was held at their rooms, 55 West Thirty-third st., on Tuesday the 6th February. Though resuscitated only about a year ago the society bids fair to become one of the institutions of New York. Some very rare and beautiful plants were exhibited at the meeting, the most notable of which were, *Aralia elegantissima* and *A. Veitchii*, *Anthurium Scherzerianum*, *Dracæna amabilis*, *Poinsettia pulcherrima plenissima*, some new *Azaleas* and very finely grown *Primulas* from William Bennett, Flatbush, L. I., well-grown *Cyclamens* from Jas. Riddle, Inwood, N. Y., a beautiful collection of Camellias from S. Henshaw, New Brighton, S. I., some most beautiful buds of Cornelia Cook, Safrano, Bon Silene, and other roses from John Jones, Madison, N. J., and a new drooping Fern from the Sandwich Islands that promises to be one of the most valuable for attractive purposes; exhibited by W. C. Wilson, Astoria, L. I. Quite a number of ladies attended the meeting, and the officers of the society feel encouraged to offer still larger inducements at their next meeting on March 6th, next.

—In answer to "W. B." we would say that many of the herbaceous Spiræs are fine ornaments to the garden, notably *S. Aruncus*, growing to the height of five feet, with flowers in long panicled spikes, whence its common name of Goat's-beard. The double form of *S. Filipendula* is very pretty; so is *S. Venusta*, with its deep rose colored flowers. *S. palmata*, lately re-introduced from Japan, is also very pretty, with its crimson panicles, but seems hard to bloom satisfactorily. *Astilbe Japonica* is one of the most lovely of the group, while *A. rivularis*, from Nepal, with its yellowish flowers, and the more uncommon *A. rubra*, from Japan, with rose colored flowers, should be grown with the *Spiræas*, to which they are related. They all require a good loamy soil, and if rather moist so much the better.—ED.

SOUTH CAROLINA—*Port Royal, February 10th.*—Since the break up of winter in the middle of January, the weather has been all that could be desired. Pleasant days and cold nights without frost have been the rule. Early peas and potatoes are well up and doing finely. I noticed a statement in a Charleston journal not long since, that the Eucalypti planted in that vicinity had been killed by the severe weather. This is what was predicted by your late correspondent, "Ollipod Quill." RUSTICUS.

—The cat who mounts the ridgepole of the woodhouse and sits apart at the concert, and is wrapped in thoughtful abstracted silence until the programme is about half through, opens out, when he does come in, with a wail that curdles the blood in a frozen beat and rouses all the other members of the troupe to a very agony of frenzied emulation.

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus*.
Drum—two species. Family *Sciænidæ*.
Kingfish, *Menticirrus nebulosus*.
Sea Bass, *Sciænops ocellatus*.
Sheepshead, *Archosargus probatocephalus*.
Snapper, *Lutjanus caxe*.
Grouper, *Epinephelus nigritus*.
Trout (black bass) *Centropristris atrarius*.
Striped bass or Rockfish, *Roccus lineatus*.
Tylefish, *Pomatomus saltatrix*.
Black Bass, *Micropterus salmoides; M. nigricans*.

FISH IN MARKET.—The abundant supply of fish in our markets gives no indication of a famine during lent, now so close at hand. Our quotations for the week are as follows:—Striped bass 15 to 25 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen), 30 cents; shad (southern), $1.50 cents each; mackerel, 25 cents; Spanish mackerel, 75 cents per pound; white perch, 15 cents; green turtle, 22 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 16 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 10 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 15 cents; turbot, 25 cents; scollops, $1.50 per gallon; whitefish, 20 cents perpound; pickerel, 20 cents; salmon trout, 15 cents; hard shell crabs, $3.00 per 100; soft crabs $1.25 per dozen; red snappers, 18 cents per pound.

FISHING TACKLE.—We do not know whether dealers in fishing tackle are able to look into futurity more than ordinary mortals, but certain it is that they are making preparations for a most extraordinary season. Messrs. Conroy, Bissett & Mallison, inform us that their wholesale business never has been so brisk. Messrs. Conroy & Mallison have just returned from extended trips to the west, one extending as far as San Francisco, and report unusual activity in that direction. This firm will have some novelties in the way of combined split bamboo and green heart rods to offer for the coming season.

—A party of five Nashua fishermen visited Long Pond, Stoddard, N. H., one day last week, and caught 800 pickerel and perch weighing 400 pounds.

FLORIDA—*St. Augustine, February 3d.*—The hunting and fishing in the vicinity is at present good, with the exception of English snipe, which are not plentiful. The premium for the best fishing for the past week should go to Master Grosvenor Atterbury, and Master Willard Parker, both of New York City. Master Grosvenor hooked a Stingaree, which, after being landed, was measured with the following result: Length, ten feet seven inches; width, four feet seven inches; length of tail, seven feet—the largest one caught in the harbor for many years. JOSIAH.

[The catching of a Sting-ray of the dimensions given with a hook, is a feat in fishing that surpasses anything we ever heard of.—ED. F. & S.]

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported the past week has been considerably in excess of any previous week this season, and with the arrivals of the early George's fleet, which will soon commence, we may expect to see a lively fishing season inaugurated. Since our last issue five arrivals from Fortune Bay have been reported, six from Grand Menan, and twenty-four from the different fishing Banks, making the total number of arrivals for the week thirty-five. The Bank fleets have met with fair success, their aggregate fares being about 640,000 pounds codfish and 340,000 pounds halibut. Prices for the latter have ruled low, on account of improved receipts, but there is no change to note in other departments of the fish market.—*Cape Ann Advertiser, Feb, 9th.*

THE PASQUE ISLAND CLUB.—The annual meeting of this Club was held on January 8th, at the office of the Treasurer, A. Foster Higgins, Esq., 50 Wall street, New York. The following gentlemen were unanimously elected officers for the ensuing year: President, James L. Vallotton; Treasurer, A. Foster Higgins; Secretary, W. A. Stagg; Executive Committee, J. B. Stearns, John F. Scott and George A. Robbins. In connection with the sport at the Island this (1876) season, the following incident, for which we are indebted to a member of the Club, may not be uninteresting. To those who have fished for striped bass, who have hooked and lost them, it certainly will be not without interest. Now, as in this case the fish was not lost, and as the mode was somewhat new by which he was finally saved, we think it of sufficient interest to place it before our readers:—

"An easy chair on the seaward end of a sixty foot stand, the memory of a good dinner, and the soothing effect of its concomitants; a fragrant Cabana, and the delicious monotone of the ocean, had in a measure soothed and rendered the fishermen oblivious to the fact that his bait (the tail of a lobster) had been cast out thirty yards, and was waiting down among the rocks. He was little expecting the distinguished visitor who about that time got scent of the delicious morsel, and who, regardless of cost, picked it up and moved grandly away towards Gay Head. Hat easy chair, dinner and cabana are forgotten. The cabana gets chewed. Away goes the striped. The nerves are braced, the brakes are put on, and after a magnificent run of a hundred yards he stops for breath. Then, with gentle hand, he is led gently back towards the stand. But here comes in a difference of opinion. Away he dashes, the reel sings a lively tune, as fathom after fathom of line goes after him, until he again shows signs of weakening. And then it looks as though the battle was over, the victory won, and what was needed was to bring him gently to gaff. But what move is that? He rises to the crest of a huge wave, giving an idea of his proportions, lashing the spray with his tail and then down he goes, and there stays. No whipping or snapping will start him, and there he lies with a hundred yards of line out, down among the rocks and seaweed. The largest bass he had ever hooked, the hardest fight he had ever fought, and now to loose him. Too bad! too bad! That fish must be saved, or at least an effort made to do so. And now a brilliant idea comes in to his head—a boat. Charlie, the gaffer of two hundred avordupoise starts on a run; yes, a run of a mile over the hills of Pasque to the harbor for a boat, and for once in the season Charlie went! And still the line, by an occasional draw, assured us that our fish "was still there." And now with what eager eyes we scan the distant headland for the boat. A long hour, when a mile away she is seen rounding the point. She comes. Charlie has pressed Tom into service, and the way in which that boat came on will not soon be forgotten. At last the critical moment arrives. The sea is a little rough, but Charlie takes the line, and the boat is backed carefully out towards the fish, until a tangle is found in the seaweed. With the aid of a long gaff this is cleared, then another, and still they find he has been running the line around rocks and the plants ("Kelp and sea weeds) of the bottom. But by great care these were unravelled, until at last the welcome cry comes, "there he is! there he is!" Well, he was still alive, but so nearly spent that they drew him up until within reach of the gaff, when he was safely hauled into the boat. Thus pluck, good tackle, skill and perseverance, saved this fish, the largest but one of the season. When brought to the scales he weighed just forty-nine pounds. The hero of this true fish story is now an officer of the Club, and a true disciple of old Isaac. Should any one desire to know the name of the gentleman, he is referred to the records of the Club." LAST SUMMER.

—A meeting of the Trustees of the Oquossoc Angling Association was held at No. 10 Warren street, on Friday last, present Geo. Shepard Page, Dr. F. N. Otis, Lewis B. Reed, R. G. Allerton, Lewis T. Lazell, and Jas. A. Williamson. The Treasurer presented a very satisfactory report of the finances and business for 1876, and prospects of the ensuing season seem bright and encouraging. *Scribner's* article on "Rangeley Lake Fishing" is attracting much attention to that region and lively times at Camp Kennebago, are anticipated this summer.

ANGLING FOR BLACK BASS.

PHILADELPHIA, February 6th, 1877.

EDITOR FOREST AND STREAM:—

Having had the good fortune of reading your valuable paper for the last two years, I have noticed a greatly increasing interest and demand for information in regard to all that pertains to the subject of black bass, habits, seasons, protection, and last but not least, the pleasure of their successful capture by means of angling. The subject is as yet in many respects, and particularly in regard to any definite data a mixed one; we are obtaining here a little, and there a little, for which we are duly thankful. In many of our streams this fish is but of recent introduction, so that with some of us at least, it might with propriety be called the "coming" fish—the fish of the "future."

In the waters of the Schuylkill, adjacent to Philadelphia, and of the upper Delaware, we have positive knowledge of the vast increase of bass; this from ocular demonstration of the fact of success in angling with bait. Especially live bait there can be not the slightest doubt, but the question of fly-fishing for bass is as yet an open one, and little more is known than the fact that at some favorable time and place, good success has been had in taking them in this manner.

Now, for the benefit of those few, who after much time and diligence, have worked their way up into the higher

branches of the craft, and know what it is to enjoy angling with the fly, could you not induce some of your many readers to contribute a few facts, so as to enable us to know in what waters do bass take the fly best; whether in rapid, comparatively shallow rifts among the rocks, or at the foot of dams or falls, or in deep pools or quiet stretches of still waters? Where our rivers are large these are pertinent questions, as one in order to solve this problem would have to whip over miles and miles in order in all probability to find out how *not* to do it. Our friend "Oedonia," in January 25th, might answer for the Schuylkill, and "T. W.," of Leesburg, in December 28th, might inform us how it is on the Potomac, as it also is large and otherwise is similar to our rivers.

In the Delaware and Schuylkill the fish will not rise to the fly where they are mostly caught with bait, for the fishing is essentially bottom fishing in deep water (say from fifteen to twenty feet), at the foot of dams or falls, or in still, deep pools. In such places those most successful use a weighted line, and endeavor to keep the bait from two to three feet from the bottom. Now one would cast with little effect with small flies, especially in such places, because of the great depth of the water.

The fact of the necessity of special flies for particular places, as far as bass is concerned, from all testimony seems quite indispensable. An esteemed friend, spending his winters in Florida for some years past, remarkable for his success with the fly, insisted on this point. In the vicinity of Enterprise, the only fly to work great results was as follows:—

Hook—Large, No. 3-0, Limerick. *Tail*—Scarlet and blue feathers, a portion of each. *Body*—Scarlet silk or mohair tipped and ribbed with gold twist, a scarlet hackle wound in at the same time, the hackle being wound close at the head to form the legs. *Wings*—Under coverts, a portion each of bright yellow and blue feathers; over coverts, the yellowish gray mottled feather from the jungle cock particularly, or a similar feather taken from the wild or tame turkey.

On the Potomac the Ferguson and those of like colors have the best record. My samples are:—

Hook—Medium No. 2 Sproat, or in Limericks about No. 1-0. *Tail*—peacock, yellow and scarlet a portion each. *Body*—Mode full, a bright yellow tipped and ribbed with gold. *Legs*—A green hackle, quite bushy, tied in only at the head of the body under the wings. *Wings*—A portion each of yellow and scarlet feather with the dark brownish mottled feather from the wing of the wild or tame turkey.

These are modified somewhat by having a red or yellow head, or scarlet hackle for legs. The colors should be of the brightest hues.

With myself in the lakes of Wisconsin, fishing from a canoe along the sluggish channels, bordered by reeds and lilypads, a large modified professor was the only thing.

Hook—Quite large, No. 3 0 Limerick. *Tail*—Scarlet ibis. *Body*—The brightest green silk floss. *Legs*—A reddish brown hackle. *Wings*—Under coverts, scarlet ibis a portion; over coverts, the yellowish gray mottled feather of the mallard.

From the above, and in fact looking over what has been written on the subject, it would seem we have *three* important colors. *First*, Scarlet or red. *Second*, Yellow. *Third*, green, all, however, more or less mixed with yellowish grays or brownish mottled feathers, which harmonize and tone them down.

In the east I have had as yet no experience, nor have I been able to meet with any one who has. I have prepared a special rod for the purpose, and am getting my flies in order, and will sift this matter to the bottom, for if we can only have good fly-fishing at our doors, what more exilerating exercise than rambling over rocks amid the romantic surroundings of our rivers and casting far out, be rewarded by the capture of a fish that has earned the reputation of being so undoubtedly game. We have the flies, the rod, etc., now let us have the time of the year and the kind of water. W. W. M.

A STEAMBOAT ON THE UPPER SARANAC.—To the genuine lover of nature, as well as the enthusiastic fisherman, the Adirondack wilderness has for many years past been full of attractiveness. To its immense solitudes, those who have grown tired with the bustling strife of the town and city have gone with the sure confidence that amid its towering mountains, its wide forests and beautiful lakes, they should find health, freedom, joy and strength. Nor have they been disappointed. The deer of the woods have been the mark of the hunter's rifle, the trout of the lakes have afforded abundant sport to the lovers of the rod and line, and the pure air, unmixed with miasmas of any sort, has put new life into the tired body of many a man who has sought it in vain elsewhere.

But changes have been going on gradually, some for the better, and some, especially to him who loves nature in her simplicity and beauty, for the worse. The luxuries of city life are many of them found in the Wilderness. And he who baits his hook or casts his fly or trails his line after him as he passes along the Saranac lakes, will not grow weary with the labor of taking trout that are only too anxious to be taken by him. If he sits patiently a half a day waiting for a strike, he need not worry. Others beside him have waited equally long, though not all with the final success of that redoutable knight of the rod and reel, Dr. J. R. Romeyn, of Keeseville, who one morning last season found himself fastened to a noble beauty of 17 good pounds. And as for killing deer, all that is now a matter of law and regulation and the unfortunate guide who allows a guest to shoot one out of season, will in due time be called to account for the same at the county seat.

But the finale is soon to be reached. It was bad enough to put the fast breeding and hideous pickerel into the Racquette river—bad enough to troll for a trout and catch a slimy alligator-jawed pickerel. But it has come at last—civilization has triumphed, and farewell, simplicity and good sport. Tell it with lament to the veterans of the woods, speak it with tones of regret to the gentle ones who have trolled around Birch Island and skirted the shores of Markham Bay and by Sweeny's Carry! Fashion, and with it, folly, rules, and the upper Saranac is to be ploughed by a steamboat, and the surrounding mountains be made to echo the shriek of the whistle and the puff of the engine. Take notice, O, mighty Hawus! Look down, O, imperial Whiteface! Speak in tones of thunder to the rash intruders, and forbid thy royal domains to suffer as if thy streams were only to turn the mill wheels of manufacturies and thy solitudes only made to coin dollars for some trader with nature. For when thy realms are traversed by wings of steam thy glory has departed, thy name shall be ICHABOD.

Burlington Free Press.

—The "*Florida New Yorker*," of February 5th, says:—

"Hereafter the winter hunting and fishing of the sportsmen of the Union will be done in Florida. This result has been accomplished largely, by the efforts of FOREST AND STREAM—the acknowledged American gentlemen's sportsman's journal."

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

WILL L. WELLINGTON, New York, please send full address to Chas. E. Cotton, Franklin, Pa.?

W. A. N., Newton, N. J.—We shall be very glad to receive such a list as the one you refer to. Have written you.

H. C. N., Ashburnham, Mass.—Where can I get a pair of Canadian snow shoes? Whom shall I address? Ans. To F. Dugal, Fabrique street, Quebec.

C. C., Payette Valley, Idaho.—Please let me know if you charge anything for back numbers or not. Ans. Certainly we do, and reserve only a limited number on sale.

O. J., Boston.—I would like to ask your opinion of a spayed bitch, whether she would be as likely to have a good nose as though she was not spayed? Ans. Yes, just as good, and for a house dog, where one did not care to breed, far preferable to any other.

J. W., Woodhull, Ill.—Can you inform me who makes the reversible oars that were exhibited at the Centennial? There was a pair attached to a small skiff on the lake on the grounds. Ans. Have sent you paper with cut of oars and address of patentee.

H. H., New York.—Please inform me when the Bench Show at the Hippodrome is coming off; and where I can get a blank to enter a dog? 2. And whether there is any good shooting at Richfield Springs in July? Ans. 1. In May next probably. 2. Woodcock shooting, but nearly all monopolized by gunners for the hotel.

TENNESSEE.—How soon in the season will perch take the minnow in Tennessee waters? Ans. Next month. I see that J. Bride & Co. advertise a cheap watch in your columns. Are they perfectly reliable—the firm, I mean? Ans. We understand that the firm are square dealers. They sell a good timekeeper for a small sum.

P. G. N., Bergen Point, N. J.—1. What is the price of Stevens's Hunter's Pet? 2. What does the word "crease" mean in the directions for loading shells? 3. What No. of Orange Lightning powder would be suitable in a breech-loading shot gun for ordinary shooting? Ans. 1. $9). 2. Creasing the shell just above the shot wad instead of turning. 3. No. 6.

E. E. G., Oswego.—In Answers to Correspondents in F. and S. of July 8th, 1875, you said that A. H. Crane, the embalmer, would issue a work on his branch of taxidermy. Has he, where can I get it, and what price? Ans. We do not know about this. You had better address E. H. Crane, at Grand Rapids, Mich.

C. C., Philadelphia.—I have a young English setter bitch which had the distemper last fall. When she got well the hair came off around her eyes, and has never grown out. Will you tell me what will make it grow? Ans. We have found an application of carbolic salve very effective. See that the dog's general health is good, and digestive organs in good working order.

L. F. B., Germantown, Pa.—Will you please inform me the best way to harden the inside of the hand, so that in catching a base ball it will not become so *very* sore? I know practice is the best way, but when you have not much time I thought there might be some preparation that might be used. Ans. No preparation; a glove with the fingers cut off is the best thing.

F. H., Boston.—I see by the Boston *Post* that a pair of Gordon setters that belonged to Mr. J. G. Bennett, said to have cost $1,000, went for $40. Can you tell me who was the buyer? Also who was buyer, and at what price the "two noble Newfoundland dogs" were sold at? Ans. You will find the information you desire in our Kennel Department.

F. B., Sing Sing.—I have about 100 quail for propagating purposes, and would like to know the best time for letting them out. About how many at a time? What distance apart? Would it be advisable to throw any feed around the place where they are let go? Ans. Turn them out the middle or latter part of March, in numbers not exceeding half a dozen at one time, and two or three days apart. Put them down near some good cover, such as a swamp or hedge row, and sprinkle grain in the vicinity.

H. E. J., New York.—My dog has the mange, and his hair is coming off, and he smells very bad. I have been putting tar on him, but it seems to do no good. He is a pointer, and is ten months old. Ans. First wash your dog thoroughly with carbolic soap, then anoint him thoroughly with the following ointment: Basilicon ointment, 2 ozs.; flower of sulphur, ½ oz.; and spirits of turpentine sufficient to make an ointment of the proper consistency to be well rubbed into the skin. Feed him little or no meat.

W. E. F., Newtown, L. I.—Some time during the past two years some party up town on the north side of your city claimed to have been successful in raising quail in confinement, and offered to advise any one who desired to experiment in that line. If convenient, please give the address of the party. Ans. We do not recall any person in particular who offered to give instruction in breeding quail; but we forward to you by mail a copy of FOREST AND STREAM of Jan. 7th, 1875, with an illustrated article on this subject. Read Ethan Allin in this week's paper.

F. K. G., Noroton, Conn.—1 What is the best size of shot for snipe? 2. In the *Rod and Gun* there is an advertisement of W. W. Greener's choke-bore guns, in which it says that Col. Bodine put 285 and 330 pellets in a 30-inch circle at 40 yards, with No. 7 shot. I would like to know how Col. Bodine gets 330 pellets in an ounce of No. 7, when there are but 291. Ans. 1. No. 10. 2. The charge was 1¼ oz., and possibly with the heavy pair of barrels 1½ oz.

DR. A., Middletown, Conn.—1. When does spring brant and goose shooting begin? 2. Which is best place within a day of New York, Shinnecock or Barnegat? 3. Address, if reliable man, to write to for information, gunner, etc. 4. My heaviest gun 8½ pounds, 10 bore. Will that do? 5. What is the smallest shot that can be used with effect? Ans. 1. Good shooting now at Barnegat. The middle of March sometimes. 2. Not much choice for brant; Shinnecock for geese. 3. Wm. Lane, Good Ground, L. I.; Joel Ridgway, Barnegat. 4. Yes. 6. No. 4 for brant; No. 2 for geese.

P. W. C., Little Falls, N Y.—What is the name of the kind or kinds of ducks which occupy the open places in the Mohawk river at or near this place at this time of the year, and what would be the best method of hunting them, they being very shy, and there being no place where one could hide near where they are? Ans. It would be difficult to say just what the birds are. They might belong to any one of a dozen species. Can't you build an ice house—that is, a shelter of blocks of ice or snow, and hide in that? We have used this method successfully against black ducks, than which no species is more shy.

YELL, Jacksonport, Ark.—1. I have a rare specimen about the size of a mallard, which we think is a cross between the squealing duck and some other water fowl. What would be the probable cost of mounting for preservation by a taxidermist? Ans. $2. In a late issue you say Messrs. Reiche & Bro. will bring a few golden pheasants from England for cost of importation for those who desire to establish these birds in this country. What would that cost probably be? Ans. Golden pheasants, $35 per pair; half for single birds; silver pheasants, $25 per pair; English pheasants, $20.

C. E. I., East Templeton, Mass.—1. Where in this State can I get a good job of choke-boring done? 2 What would be the cost of having one barrel of a cylinder bored breech-loader choke-bored? 3. What would you consider a first rate pattern for a choke bore No. 10 bore, 3¼ drs. powder, 1¼ oz. No. 6 shot, 30 inch circle, 40 yards? Would increasing the charge of powder increase the pattern? Ans. 1. Messrs. Wm. Read & Sons, or Wm. H. Schafer, of Boston. 2 It should not exceed $4 with a pattern guaranteed. 3. 200 pellets. Increasing the charge of powder would increase the spread of the shot.

W. H. S., Pittsburg.—1. Will the expansion of the two shot barrels in the Baker gun interfere with the accuracy of the third (rifle barrel), as they are soldered together? 2. Do you know what firm manfacture a three-barrelled gun, breech-loader, with the rifle barrels on top, the shot barrel beneath? A friend of mine has seen a gun of this kind. 3. Will a setter and pointer dog work in the fields together as well as two pointers or two setters? Ans. 1. No. The expansion would be general. 2. No; have never heard of it. 3. Yes, just as well, particularly if they have been broken together.

W. H. A., Jersey City.—Where can I buy feathers of different colors, mohair, and other requisites, for making artificial flies? Ans. There! no dealer in these articles. You will have to pick them up where you can. The ducks you shoot, especially the mallard and wood duck, afford a fine assortment of feathers. The wild turkey, the domestic game cock, the guinea fowl, and the golden pheasant and the blue jay are much used. Scarlet ibis, parrot feathers, etc., can be bought from general feather dealers. You can get some materials from taxidermists, and some from the fishing tackle dealers.

J. J. B., Yonkers, N. Y.—I have twelve dozen of live quail to turn out in the spring. They are dying off daily with what I call the pip. Will you please to give me a remedy? I feed them on cracked corn and buckwheat. Is the feed good? Their coop is 10 feet long, 3 feet wide, covered with canvas, and is 3 feet high, with ample ventilation, etc. Ans. It is very difficult to cure the pip. The best remedy is to turn the quails out into a large, warm room, and keep them sheltered from draughts. In some instances it is impossible to know what really ails the birds. It will be well to touch the throat with a small brush wetted with a solution of salicylic acid.

RUBBER CEMENT.—Joseph C. Grubb, of Philadelphia, sends us the following recipe in answer to a correspondent's request for such as shoemakers use. The use as the ordinary naphtha, benzine, or chloroform preparation will not answer. Apply as directed one cannot fail to make a finished job: One-half pound bi sulph. of carbon; 3 handfuls of gutta percha; put in a wide-mouthed bottle; shake frequently; at the end of two weeks strain through a cloth, return to bottle and cork tightly, for reasons that will be obvious. To apply, first dry the article, then smear the cement on and allow it to evaporate before bringing edges together. After it has become light colored in spots, warm and bring edges perfectly together; stand away for a while and the job is complete.

T. C., Baltimore.—I have a setter pup four months old, two weeks ago he showed weakness in his hind legs; now he cannot stand and his hind legs are useless. He passed a worm. I have given him five doses of santonine (one grain each time) and a cathartic pill to work it off, but no sign of worms. His passages are good; he is very nervous. His head is strong and he has an enormous appetite. He has become very thin? Ans. Your puppy has chorea, usually the after result of distemper, and aggrevated by the presence of worms. If santonine will not remove them try areca nut, giving three powders of 15 grains each two hours apart, and four hours after give half an ounce of castor oil. Feed little or no meat, and give a tonic, but it is questionable whether the dog will ever entirely recover his strength.

E. W. B., Lynn, Mass.—1. I want to shoot my rifle 600 yards over water. If I sight it at this distance will I need to change the sights when shooting over land. 2. What size bullseye should I use at 600 yards, and how many times should a good marksman hit it at that distance with a rifle, 28-inch barrel and .32 calibre? 3. Can a person do better target shooting with a 32-inch barrel than he can with a 28-inch, both of the rifles using the same size of cartridge (38)? If he can, what makes the difference? Ans. 1. The attraction of gravitation will in both cases be the same. 2. The bullseye used at 600 yards is 32 inches in diameter. How many times it could be hit by a marksman is something which depends entirely on the man. We should think that a 38 calibre would do rather small for this distance. 3. The only difference here would be that the 32 inch barrel could be kept on the target better.

S. H. W., Washington, D. C.—1. Do you consider a good gun by Clabrough equal to one by Dougal or Greener? 2. Will a cross between a Gordon and fine native bitch turn out well? 3. Can I get 12 gauge shells 2¾ in. long? My gun is chambered for that length and I can only procure here shells of 2½ inches. I do not think a gun will shoot right unless the shells are as long as the chamber, am I right? 4. What is the proper charge for a 12 gun for general field shooting? Ans. 1. Not equal to Dougal, for the latter only makes fine guns, while most of Clabrough's are of the lower grades. 2. If both were fine field performers it might, for work, but we should prefer to keep the strains distinct. 3. Not Ely's, but the U. M. C. Co. will make them to order for you. You can get Ely's blues of 3 inches; the shells should fit the chamber. 4. Depends on the weight; for 7½ pounds, 3½ drachms powder 1¼ ounce shot.

WANNALANCET, Lowell, Mass.—Our half Scotch and half skye terrier, when small, too small in fact to climb out of his bed, was kept soaked all one nigh by an overflow of water from a basin overhead. At that time he had shown some symptoms of a difficulty with breathing, which since then seems to have become a chronic cold in the head. He is so sick at times that he seems about ready to give up altogether. The last time this occurred a vet. surgeon, who was called, prescribed an arsenical preparation, and he has been somewhat relieved, but still breathes very hard; blows a quantity of whitesh matter from his nose very often, is quite thin in flesh, and is in much trouble generally. As he is now full grown, do you suppose his disease is hopelessly chronic, and if not, what do you advise? Ans. We should think from your description that your dog was a victim of consumption, and unless highly valued should be put out of his misery. Give him the most nourishing food three times a day, but a little at a time, with plenty of exercise. A tonic of quinine and iron three times a day before meals might be beneficial.

RURAL, Hagerstown, Md.—1. A friend of mine has a breech loader, side action, with maker's name (C. H. Mills) engraved on the lock plate, and "fine London twist," on the barrels. Do you know such a gunmaker; if so, what reputation has he as a manufacturer of guns? 2. I have before me a piece of paper 2½ inches long, by 18 inches wide, in which there are 316 No. 9 pellets. The target was made by a 9½ or 10-lb. gun, No. 10 bore, at 40 yards. I cannot give you the charge used, but suppose it to have been a charge suitable to a gun of the weight and calibre I have named. What is your opinion of the target? 3. Are dogs regarded by the law in your State as personal property, and has there ever been a case in your courts where a party was convicted and sent to the State prison for stealing a dog? Ans. 1. We do not know of such a maker, and would infer from the barrels being so stamped that they are *not* fine London twist. The gun is probably one made for the American market. 2. If the charge of shot did not exceed 1¼ ozs. it is a first rate target. 3 Dogs are certainly property, and it has been so decided in our courts; but we do not know of a case where a dog thief has been sent to the State prison.

J. P. HUTCHINS, Oneida, N. Y.—I should like your opinion as to which is the best illustrated work on Ornithology now published that can be bought for $15 or $20? Also be pleased to tell me how many and whose works of the kind are extant. Would you give me the address of Prof. Elliott Coues? Ans. We know of no illustrated work on ornithology which can be purchased for the sum mentioned. The most complete work on the subject of American birds, so far as it goes, is Baird, Brewer & Ridgway's recent work—three volumes at $10 a volume, uncolored; $20 colored. This work, however, only includes the land birds, the fourth and concluding volume never having been issued. Each of the volumes has a number of figures of the heads of the different species. Some of the more important works on American ornithology are Wilson's American Ornithology, Audubon's Birds of N. A., Swainson's Birds in Fauna Boreali Americana, Birds of N. A., by Baird Cassin & Lawrence; Coues's Key to N. A. Birds, and Birds of the N. W. There are many others, besides pamphlets and papers innumerable, but we have not the space for a complete list. Dr. Elliott Coues, Smithsonian Institution, Washington, D. C., will reach him by think-

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, THE CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, FEBRUARY 15, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

FISH CULTURE.—To-day we resume the publication of a series of valuable articles upon Fish Culture, which have heretofore appeared under the signature of "Ichthyos," but which will hereafter bear the real name of the author, Dr. Nahum E. Ballou, President of the Fish Culturists' Association of Illinois, whom we are proud to introduce to our readers.

DELTA KAPPA EPSILON.—At the last dinner of this powerful College Association, which is represented by some thirty chapters in various parts of the country, a plan was adopted for a permanent organization of the Alumni resident in New York and vicinity, and an Executive Committee was appointed for the coming year with power to choose officers of the Association. The committee have unanimously selected the following board of officers:—

President: Sidney Webster.
Vice Presidents: Dr. E. G. Bartlett; Bayard Taylor; Whitlaw Read; and Charles Hallock.
Secretaries: Prof. J. C. Smock; and John Claflin.

—The mean mid-day temperature at New Smyrna, Florida, for the month of January, as furnished at the signal service station by Maj. Geo. A. Alden was 67 degrees; mean temperature at 7 a. m., 55; at 9 p. m., 59. Highest for the month, 81 degrees on Jan. 16th; lowest, 36 degrees.

—The thaw has ended the water famine in the western part of Massachusetts. The mill streams have been filled without being swollen to the freshet pitch, and the springs, wells and reservoirs are raised so that no further dearth of water will be experienced, even with continued cold weather.

—The annual dinner of the Blooming Grove Park Association, was held at the Hoffman House, on Tuesday evening last. A large number of ladies and gentlemen participated.

—Prof. J. A. Allen, of the Cambridge Museum of Comparative Zoology, is kind enough to say in a recent letter:—"I am greatly pleased with FOREST AND STREAM, and know that it is doing a good work. It meets a want that no other paper with which I am acquainted so well fills. Its tone is elevated, and its pages are filled with information highly instructive to the majority of sportsmen."

—Since the arrival of the Russian fleet and the Duke Alexis, the hotels at Norfolk have been packed.

ORIGIN OF THE PERCHERON HORSE

FOR several hundred years there has existed in the interior of France a race of horses, famous for their useful qualities, and possessing a remarkable degree of uniformity in all their essential characteristics. These horses were called Percherons from the fact that they were mainly bred and reared in the ancient Province of La Perche, a district situated to the south and west of Paris, and embracing a considerable portion of the territory that is not covered by the modern departments of Orne, Eure et Loir, Loir et Cher and Sarthe.

The precise date when this race of horses assumed the distinctive features which entitles it to be classed as a fixed breed is not known, neither can all the various elements which entered into its composition be determined with any great certainty. The French literature is especially barren of any definite accounts concerning the origin of any of the breeds of horses in France. No stud books of any kind have ever been kept, and no systematized attempt at recording the genealogies of any of their breeds was ever made. It is a well-known historical fact, however, that the Norman war-horses, as used by the armor-clad knights in the days when chivalry flourished, during the time of the Crusades, were famed for their stoutness as well as their activity; and that, in spite of the lack of paper pedigrees and stud books, "selection of the best" and survival of the fittest, had given to this part of France, near centuries ago, a race of horses that was pre-eminently adapted to the wants of that country.

But the little history that can be found touching this breed definitely points to an Eastern origin. Some French authorities go as far back as the year 731, when France was invaded by the Saracens, 300,000 strong, under the command of the famous chief Alderame. The utter defeat and overthrow of this barbarian host by the French, under Charles Mortal, on the plain between Poitvers and Tours, left the fine Arab and Barb steeds, upon which many of the invaders were mounted, in the hands of the victors, and these horses, crossed upon the large, strong native mares of that region, if they did not form the starting point for the breed, which, since that time, has become so famous, undoubtedly had much to do with creating the foundation upon which it was ultimately built. Another large infusion of the same Oriental blood took place upon the return of the Crusaders, who brought with them many of the finest Arabian stallions, and these were also extensively used upon the already excellent stock of La Perche, and served to stamp upon them the form and other distinctive marks of the Arab to a still greater degree than they possessed. The infusion of fresh Arabian and Andalusian blood was kept up for many years, at irregular intervals, the Lord of Mantdonbleau, Geoffry IV., Rotron, Count of Malart, Count of La Perche, Count Roger, of Bellesmar, and many others of the nobility, having been distinguished for the importations made by them, and the interest they took in the subject of breeding horses; and as late as about 1820, we find that the two famous Arabian stallions, Godolphin and Gallipoli, both grey, were imported and extensively used by the direction of the Government.

The region of the Perche was especially favorable, in all the elements of soil and climate, for producing horses of the highest excellence, and its inhabitants have long been noted for their attachment to this noble animal. Indeed it is doubtful if, in his desert home, the Arabian horse ever found a master equally as affectionate or kind, as well acquainted with, and as ready to supply all his wants, as he found in his new home among the people of La Perche. They were proud of their horses, and the utmost care was exercised by both Government and the people, in the selection of sires and dams.

Another cause which exercised a powerful influence in the building up of this breed, and in giving it adaptation to the necessities of the country in the country in which it was reared, was the custom, which still prevails universally throughout France, of leaving all the male colts entire. None are ever gelded, and it is only after a young horse has proven that he possesses qualities which are especially desirable, that he is used in the stud. All the males being left entire, there is a much wider range for the selection of suitable sires than there would be if the custom of gelding a large majority of the young colts, which prevails in most other countries, were followed. It is from these sources alone, viz.: the large and constant infusion of Eastern blood upon the stock of La Perche, already distinguished for the endurance and stoutness of its horses, the natural adaption of the soil and climate, and the care and attention paid by the Government and the people who loved their horses, and lived with them, for successive generations, selecting only the best for breeding purposes, that formed, by gradual approaches, that excellent type which finally came to be known and recognized as the Percheron horse; and he who looks for a definite point in the equine history of France where they first came to be acknowledged as a distinct breed, will search in vain.

Aside from the history and traditions of the country, the Percheron horse himself furnishes unmistakable evidence in his form, disposition, color and general characteristics, that he is closely allied to the Arab. These characteristics have been modified somewhat, it is true, and the size has been greatly increased; but, in the hands of excellent horsemen of La Perche, and under the careful and fostering supervision of the Government, which exercised a direct control over the selection of sires, he seems to have obtained all that was good in his Oriental ancestry; and this added to the greatly increased size which have been attained, made the horses of La Perche many years ago, the wonder of the world for their specialty of rapid draft—their ability to move a heavy load at a rapid gait. It was this acknowledged superiority of the Percheron horse in the diligences, fast coaches and omnibus of France, that first caused the attention of the outside world to be directed to them. It was not simply as draft or cart-horses that they were distinguished; on the contrary, had they possessed no excellence beyond this, they would scarcely have attracted any attention, for other countries possessed horses that for the purposes of heavy draft alone, were certainly their equals, if not their superiors; but it was in that happy combination of size and form, which gave them activity, quickness of motion, strength and endurance, that they were found to excel the horses of all other countries.

This typical horse, which gave name and fame to the Percheron blood fifty years ago, was from fifteen to sixteen hands high, and weighed from twelve hundred to fourteen hundred pounds. In color fully twenty per cent. of them were grey (many of them beautifully dappled but growing white as they advanced in years), and the remainder were of various colors, the black preponderating. They were noted for their kindness and docility, and the certainty with which they transmitted their own qualities gave the Percheron horses a degree of uniformity, in all of their characteristics, that has scarcely ever been equalled by any other breed. Under these favorable circumstances they were bred and reared for successive generations, the Government constantly exercising a careful supervision over the breeding studs that were established in various parts of the district, occasionally trying some new cross, but carefully adhering to the original type, and rigidly rejecting all excepting the very best specimens in the stud. But with the introduction of railroads the use of the post-coach and diligence was practically abandoned, and as this was the specialty for which the Percheron's we have described have been bred, so, with the new order of things, come a demand for horses of a larger type. Greater weight, a heavier bone, and more substance were required; and since that time the improvement of the Percheron, in this direction, has especially engrossed the attention of the French breeder. Among the famous stallions imported from France by Messrs. Sackrider & Chrisholm, of Elgin, Ill., are those at present quartered in San Francisco, at the famous Ricord stables, owned by Messrs. P. L. Archibald & Co. The stallion Hercules is possibly the largest horse in the United States, he being eighteen hands high, six years old, light dapple grey, and weighing two thousand pounds. Another horse is Napoleon, sixteen and one-half hands high, six years old, dark dapple grey, weighing seventeen hundred pounds.

"JAMRACH."

A CORRESPONDENT asks, "Who is Jamrach?" Where is his establishment, and in what particular animals does he deal?" Mr. Jamrach is the largest dealer in animals in existence. His name sounds savage, and seems well suited to the savage animals he is constantly buying and selling, but it strangely belies its owner, for he is one of the most courteous and gentlemanly of men alive. His establishment is in the city of London, in that part known as St. George's street, which runs due east from the Tower, and near the river Thames. Once in St. George's street, by ear you can tell where Jamrach's is. Macaws, parrots, and other noisy birds are shrieking always, and you have but to follow the sound to reach one branch of the strange trade. In another part of the great warehouse you will find the lions, tigers, rhinocerouss and other gentle things, and there you may purchase these same at wholesale or retail, just as you would purchase dry goods or groceries in your own city. At all times has Jamrach on hand zebras, hyenas, tigers, leopards and other wild beasts, all for sale, together with a young lioness or two, who are warranted to tear you in pieces in less than no time, provided they can get at you! Birds and reptiles innumerable has Jamrach also, and from his strange warehouse are continually going out neat little parcels of tigers, zebras and boa-constrictors, to various directions. Some to the gardens of the different governments of Europe; some to the Zoological Gardens, London, and other institutions of same kinds elsewhere, and some to our own happy land. There is no limit to this strange trade. Agents are at work for the "beast dealer" in every quarter of the globe, and he dispatches travelers to pick up stock in savage Africa or Central America, just as other traders send agents to purchase goods in the large commercial emporiums of trade. The London "Zoo" pays him thousands and thousands of dollars; his stock is always complete, consignments are constantly coming in, and the creatures are as constantly being sold and packed off. The manifestly business air of Jamrach's place, and the way in which the denizens of the stall are regarded as mere items of stock, with fixed prices attached to each, strike one, if he be a stranger. However, it soon becomes so matter-of-fact with him, that he begins to think that it is "beasts" instead of dry goods or groceries, that's all, and were Jamrach to say, "I can do you a neat thing in giraffes!" or, "Can I tempt you with something very tasty, in the alligator line?" it would seem not in the least incongruous, and so you would soon pass through in the strange show rooms, much as you would any other place of regular trade.

Once in Jamrach's, however, your illusions as to the prosaic character of a trade in wild beasts soon vanishes. A roar here, a growl there, a snort from yonder, and then a mad dash at the iron bars, made by a young lioness who has taken a fancy to you, and who has quite a desire to flash her white pointed fangs in your body. She makes the iron bars shake, and the wooden partitions trembles; her claws are expanded, and her mouth cavernously open, but you are safe, though you do not recover your presence of mind for a moment or two, and you conclude these were not the kind of animals you have been used to seeing in Zoo's or menageries, however wild and untamable they were there represented.

Here comes a cab to the door. It contains what looks like so many packing cases. A foreign looking young man alights and presents a bill of lading. It is for a little lot of rare birds from America, and the packing cases turn out to be strong, wooden cages, containing red ibeses, white eagles and trumpet birds, which, when unpacked, meet with a fearfully noisy welcome from the macaws and parrots.

On one occassion, Jamrach, Jr., went to Calcutta, at the request of his father, to take charge of and deliver in London a nice little lot of merchandise, consisting of six tigers, three rhinoceroses, several elephants, and a number of smaller things which were there waiting to be brought away, nearly all of which, if I remember rightly, were safely landed in due time at St. George's street.

Occasionally Jamrach lends his animals, or rather rents them out at a certain sum per month. A few years ago a pair of splendid elephants were thus loaned to the Jardindes Planters, in Paris.

Of course losses by death are many and heavy. There will always be a percentage of loss in the transporting of the stock from place to place, many also die in the establishment, and thus, at the end of the month, when the profit and loss list is made up, the books show that thousands and thousands of dollars have been carried off by death.

Jamrach's organization for the carrying on of his strange trade is not the least curious of the many curious things connected with it. No native trapper in any part of the globe, however remote, but knows where Jamrach's agent, and Jamrach's money can be found. Jamrach's trade list is a complete lesson in natural history.

"What may be the price of a rhinoceros, a tiger, a zebra, or anything of that kind?" Well, $6,000 for the first; $2,000 for the tiger, and for the zebra say $1,500. That is what you must pay in London—charges for transportation, and deliver at your Zoo or Menngeric is a matter you will have to make a special agreement about; and you must also, unless there be a special agreement to the contrary, run a large part of the risk of said transportation.

When our readers visit London, we advise them by all means to call on Jamrach, for a visit to him and a conversation with him, is to learn natural history, and find it coupled in the strangest way with political economy, and the mercantile law of profit and loss.

EDUCATION IN THE ABSTRACT.

PARENTS, and especially mothers are the first educators.

In one of our magazines sometime ago the assertion was made, in reference to the Venus of Milo, that it is "the most perfect type of that pure Greek art, which all the world studies, but cannot reproduce." And going on, the writers asks "Do you wonder why? It would make a very long story to give you all the reasons. But one great reason is that our artists and sculptors despair of finding any living models, either of men or women, so noble and natural and simple as those which the Greeks saw around them everywhere. For they made it the business of their lives to grow sleek and blooming, from beautiful children to beautiful men and women, and so on to happy vigorous old age.

In that olden time a child was taught to read, write, and cipher; to play the lyre and chat the National odes, celebrating brave deeds and great victories; to wrestle and to perform all the bodily exercises." "Youths and maidens went daily to the gymnasium, and there were practiced in running, leaping, throwing the lance and discus, and in every other exercise which could make them strong, healthy and agile. Then the wise were strong, and the learned beautiful. There were no narrowed chests and stooped shoulders; no pale faces and blinking eyes from desk and study and school-room; no warped muscles from workbench and loom. Artisans, philosophers, poets, rich and poor, went alike through a daily course of training, ate sparingly, and lived through all seasons in the open air."

It is possible that this picture of life in the birthplace of Art may be slightly overdrawn; and, further, it is certain that much of its suggestiveness must be lost upon us, through the difference in the surroundings of life in our day. But after making every allowance the passage serves to remind us of the otherwise well established truth, that in those days a due attention to physical development was not found inconsistent with the attainment of supreme excellence in Art, philosophy, science and literature. In this vaunted age of progress, we may find it conducive to a proper feeling of humility to turn back and discover one single point which was reached in a bygone age, and from which we have retrograded. Such is unquestionably the case in the science of education. Then the process appears to have had a wider scope than is generally allowed it now. It meant the development in due proportion of every natural faculty, while in our time it too often means a system by which the intellectual powers alone can be forced to a precocious and spurious maturity. We might take up a great deal of space in attempting to impress the very evident lesson which the ancients could be made to teach, but shall content ourselves with some time hence with simply and briefly stating our own conclusions, and applying them to the general question before us.

GAME PROTECTION.

ASSEMBLY ACTS.—An act has been introduced into the State Senate amending the incorporation act, by which societies may be formed for the purpose of improving and breeding poultry, game birds, domestic and pet animals, fish culture, etc., upon filing in the office of the Secretary of State, and also in the office of the clerk of the county in which the business of the said company is to be conducted, a declaration signed by all the incorporators (13) and acknowledged before any officer authorized to take the acknowledgement of deeds in this State, expressing their intention to form such company, together with a copy of the charter proposed to be adopted by them. The corporation shall exist from the time the declaration and copy of charter has been filed.

Also an act providing for the construction of fishways in the State dams across the Oswego, Oneida and Seneca rivers.

N. Y. ASSOCIATION FOR THE PROTECTION OF GAME.—The monthly meeting of this Club was held on Tuesday evening, at the residence of Mr. Charles H. Housman, No. 19 East fifty-fourth street. Mr. Clinton Gilbert, President, occupied the chair. The Secretary read a mass of correspondence from persons in other States, asking for information and advice on the subject of the preservation of game, and stated that the most cordial co-operation had been extended to all such inquirers. Senator Wagstaff reported that the amendments to the game laws (printed by us week before last) would undoubtedly be passed at the present session of the Legislature, with the exception of section 6, which permits game or fish to be sold out of season on the plea of its having been killed out of the State.

This section, Senator Wagstaff explained, would entirely nullify all previous legislation for the preservation of game, and had caused the defeat of the bill last year. With the objectionable section stricken out, the bill would undoubtedly pass. He would suggest that the next night of meeting be altered to Friday, so as to give them an opportunity of inviting the members of the Legislative Committee on Amendments to the game law, and discussing the subject in all its bearings. The suggestion was adopted, and the next meeting night changed to Saturday. Mr. Whitehead reported that no venison could now be found in the markets, nor was there any in the city except what was secreted by some commission merchants, who managed to elude the vigilance of the officers of the Association, but would unquestionably be entrapped some day. Mr. Whitehead also commended to the notice of the meeting that section of the Pennsylvania game laws prohibiting the pollution of streams and rivers by the refuse of oil factories and gas-works, which practice was terribly destructive to fish. The matter was referred to the Committee on By-laws. On motion of J. W. Cuthbert the Executive Committee was authorized to invest a surplus of $500, in addition to the fund of $4,000 already invested.

Hon. Seth Green, who was present, said that in his opinion one of the greatest mistakes made in framing the game laws was in allowing the spearing of fish in any season. The practice had been extended into the spawning season, and as a consequence bass, bull-heads, and other fish were being destroyed by wholesale. Mr. Robert B. Roosevelt also alluded to the practice of spearing in the spawning season, and said that legislation was absolutely necessary to stop the wholesale destruction of fish. The State Fishery Commission had stocked Owasco Lake, in this State, but no sooner did the fish begin to thrive than the residents of the locality commenced the practice of spearing, and continued it through the spawning season, taking in as many as three hundred pounds of fish a night. So defiant and lawless did they become, too, that nobody dared interfere, and the consequence was that the fish which had been placed there at such immense trouble and expense was speedily exterminated. The subject was one of very great importance, and he hoped the Association would meet the Fishery Commissioners and agree upon a joint plan of action for securing legislation and to do away with the evil.

TREATMENT OF QUAIL IN CONFINEMENT.—Our old friend Ethan Allin, of Pomfret Centre, Conn., sends us the following communication on this subject:—

"I would say a few words in regard to care of confined quail, as there seems to be a general effort among sportsmen to secure quantities of live quail to keep over for breeders the coming season. I had some experience of this kind some years since, when the severe winter killed off the quail in this section, and learned by sad experience the proper mode to care for them. If they can be kept on the ground surface just as conveniently, I should prefer it; give plenty of water and different kinds of grain and gravel; see that their apartments are kept clean and feed no faster than they consume; let the water be fresh or changed at least once a day; give something green occasionally; make them a dusting place of dry sand or wood ashes, and most important of all, do not have their coop over 12 inches high, as if they are in a high coop they are liable to get frightened and bang their heads at top of the coop. I lost more by having them in coops some four feet high. They would get frightened by a sudden flash of a lantern, and so bang their heads as to kill themselves. When so disturbed in the night by a sudden flash of light from a lantern they would often flutter and bang themselves by the half hour, before they would get quiet. Be very quiet and gentle when around them, and disturb them as little as possible. I have written this in hopes it may be of some service to Bob White. In this section the quail have stood starvation and snow much better than any one would suppose. I have endeavored to feed some bevies, but owing to the crusted and deep snow it not only was difficult to get about in it, but also owing to the crust it was difficult to discover their whereabouts. The snow has now so far disappeared as to leave plenty of bare places for them to obtain all food necessary for their support, and from what I hear from different quarters in this section there is still a good supply left if nothing befalls them between this and April next to make the supply more abundant the coming season than they have been here for some years past."

ETHAN ALLIN.

PEOTONE, Ill., Jan. 31st.

EDITOR FOREST AND STREAM.—

I wish some one who can handle it would agitate the subject of game laws, and write something in favor of extending the shooting season on quail, pinnated and ruffed grouse at least a month longer. There are one or two changes in the laws of this State, which could be made without injury to the game, in fact, one change would, I think protect them much more fully. First I would have the shooting season extended to the 1st of February, and the close season on woodcock to the 1st of October or September. I doubt if there would be any appreciable decrease in game in consequence of the first change suggested above, and I am sure that the second suggestion would materially aid in the increase of the last mentioned bird.

Second, I would alter the section which allows dealers thirty days after the 1st of January to get rid of game on hand. I think, or at most, fifteen days would suffice, and every dealer could easily get rid of whatever game he had in that time, if he knew he had to do so, or pay a heavy fine. As the law stands now every inducement is held out to the market shooter, and the produce dealer, or commission merchant, the one to kill and the other to buy for at least fifteen days of the thirty days of grace allowed by law. This is the case in country towns, and being so there is of course so in the cities. Now if the time was shortened to ten days, city dealers would be anxious to get off their stock on hand, and would refuse to buy any game after the 1st of Jan., country would be obliged to stop buying also, and the market shooter his "occupation gone," would "hang up his fiddle and his bow," in other words, his gun, and wait as sportsmen are obliged to do.

UMBELLUS.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

THE MOUNT VERNON DUCKING CLUB—POISONED BY EATING PARTRIDGE—A SNAKE STORY—GOLD FISH DESTROYED BY EELS, ETC., ETC.

WASHINGTON, D. C., February 5th, 1877.

IN a recent letter I briefly alluded to the magnificent duck shooting of the lower Potomac and Chesapeake Bay, and I might fill columns of the FOREST AND STREAM in regard to the rare sport afforded to lovers of aquatic shooting on these waters. We have among our Washington sportsmen many who enjoy this sport, and now that the river is again clear of ice there will soon be an active campaign against the swan, geese and ducks of every variety which are so plentiful. From now until the end of March duck shooting in this locality is probably equal to that of any other section, and busy preparations are being made for the sport.

The Mount Vernon Ducking Club, composed of gentlemen of this city, is a decidedly popular and well conducted organization, and those lucky enough to secure membership therein enjoy many privileges and comforts during their shooting excursions. This club has had a sort of informal existence during the past twelve years, but it was not thoroughly organized until about three years ago, when Mr. J. H. Kuehling, one of the best shots in Washington, and a true sportsman, was chosen as its president. The active interest which he has taken in the organization has done much towards its present popularity. The membership is limited to twenty-five, and is composed of gentlemen of high standing in the community, most of whom are good shots, and they frequently return to the city with all the game they can carry, after spending a day or two at the shooting grounds or flats near Mount Vernon. Mr. Kuehling, who may be regarded as the originator of the club, owns a farm adjoining the Mount Vernon estate, and upon this a very comfortable club house is located. It is suitably furnished, and the property of the club consisting of boats, decoys, shooting boxes, blinds, etc., is all properly cared for by a competent janitor. There is an extensive flat immediately in front of the club house, which seems to be a favorite feeding place for the ducks. Canvas-backs, red-necks, shufflers, mallards, teal, whistle wings and butter balls are among the varieties killed by the members, and they are anticipating rare sport during the next two months. Mr. Wm. B. McKelden is now president of the organization, and the following named gentlemen are members: J. H. Kuehling, H. R. Searle, Col. John R. Morehous, Harry King, Capt. M. A. Tappan, Dr. Barnard, Dr. L. Wilson, Geo. Ryneal, Edward Graves, C. F. Willett, M. M. Eldridge, Wm. H. Tucker, N. C. Farnum, L. P. Humphrey, J. Baker, E. T. Thomas, A. B. Bryan, F. Pratt, Mr. Houghton, E. M. McLeod, L. A. Bartlett, Mr. Woodbury, and Wm. Turner. These gentlemen are all true sportsmen, and they take great interest in their organization. They are constantly adding to their stock of decoys, boats, etc., and thus they have every facility for rare sport.

The recent severe illness of Senator Anthony, of Rhode Island, was caused by eating a partridge which no doubt had been feeding upon laurel leaves. His attending physicians are confident that he was so poisoned. At first he was in great pain, and vomited freely. For several days he was confined to his room, but has entirely recovered now,

and resumed his seat in the Senate. Mr. Anthony ate the bird in Baltimore, to which city he was called on business and was taken sick on the train as he returned to Washington a short time afterwards.

After two months of hard winter we are now enjoying delightful spring weather, and should it continue we will soon have good fishing. In early spring we have magnificent perch fishing in the vicinity of the Little Falls, and frequently catch white perch at that season weighing a pound. The large perch are caught only in deep holes, and they seldom remain in these waters longer than two or three weeks. They seem to follow the shad and herring when they run up to spawn, and return to salt water soon after those fish.

I mentioned the fact in my last letter that farmers in Maryland and Virginia have been feeding the partridges during the severe winter weather. Since then I have learned that the practice in some localities has been almost general, and many birds have thus been preserved.

There are quite a number of fountains and pools in our public squares which have been stocked with gold fish, but it has been noticed that the fish did not "increase and multiply." Some of these pools had piles of stone in the centre, placed there for the protection of the fish. In cleaning out a pool some time since it was discovered that the pile of stones instead of being a protection for the fish was but a harbor for eels, thirty of which, varying in size from six inches to three feet in length, were killed. The eels were very destructive to the gold fish, and to prevent them getting into the pools wire screens have been attached to the inlet pipes. If the eels can be kept out the gold fish will increase rapidly, and soon our pools will be filled with them.

A gentleman named Owens recently advertised in the Baltimore *Sun* for fifty live partridges to stock his farm, and soon thereafter his agent received a letter from a farmer in one of the lower counties of Maryland, stating that he had a certain number of birds and would soon forward them. The farmer very particularly wanted to know if the partridges were for the "apple sass man," meaning Solon Shingle, who is a Baltimore county farmer and sheep raiser.

The Cambridge *Chronicle* says that some two or three hundred canvas-back ducks were caught fast during the late freeze off the Talbot shore of the Choptank river nearly opposite Cambridge, and in that condition were picked up without difficulty. Speculations upon this singular occurrence are various, some supposing that the snow and sleet caked on the ducks' wings, thus preventing their flight, and others that they were caught in the moving ice.

Rifle.

INTERNATIONAL MATCHES.

FOR the last three years, in fact since the commencement of long-range rifle shooting in this country, the American marksmen have been acting on the defensive, accepting all challenges, but never issuing any. "Excelsior!" This is the time for them to aim for a higher position and add, if possible, more glory to their present brilliant record of rifle shooting. Why not challenge the best marksmen of Great Britain? During the spring of last year an invitation was issued to all teams of foreign countries by the joint committee of the Amateur Rifle Club and the National Rifle Association on behalf of the American riflemen to come to this country and compete for the championship of the world and the Centennial long-range trophy. Our Irish friends, the plucky Australians, who traveled so many thousand miles to shoot with us, the Scotch and Canadians, all came to pay this country their compliments, and, it might be added, they were a little confident of carrying off the honors; but the team to represent England's skill with the long-range rifle was absent; it would have been warmly welcomed, and it is not likely the captain of the English team, which had won the Elcho shield and were champions over the Irish and Scotch, was afraid of having his men defeated. However, he declined the American's invitation, giving as his reason that the riflemen of the various portions of Great Britain should only be recognized as British marksmen and not as individuals. He signified his willingness to form an Imperial team to consist of picked men from Great Britain, to visit America and enter the Centennial competitions. To this the Americans could not comply as they had invited the English, Irish, Scotch, Canadians and Australians separately. Sir Henry Halford, Captain of the English team, had certainly the right to entertain such an opinion, but the rest of the British Kingdom, or at least a majority of it, thought differently, as was demonstrated by the appearance of the respective teams in this country and their participation in the matches at Creedmoor. It was an important event in the history of rifle shooting to have a representative team composed of the best long-range riflemen that five prominent portions of the world could produce, altogether on one field in competition for the supremacy in skill as marksmen, and there has been no event for a long space of time which has done as much to cause the friendly feeling that now exists between America and Ireland, Scotland, Canada and Australia as the International long-range matches. The true metal of the Irish, Scotch, Australians, and our friends over the border, has been seen and admired by the people of this country.

In the Centennial competition for the trophy the Scotch, as is generally known, made the best total score for a team of eight men in one day's shooting on record. The Irish and Australians pluckly endeavored to regain their lost ground on the last day's shoot were greatly praised, and it is doubtful whether Milner's score will ever be tied. To shoot fifteen consecutive shots into a bullseye three feet in diameter a thousand yards off is a feat in marksmanship almost beyond belief. But we have not seen the notorious pluck and skill of the English riflemen. If they will not come to see the Americans let the Americans go and see them; beard the lion in his den by sending a challenge to the long-range marksmen of Great Britain to shoot against any team they may desire to produce. They can form their Imperial team by selecting the best shots of England, Ireland, Scotland, Wales, Canada, Australia, India, and all other portions of the Globe governed by the English crown. The riflemen of America can well afford to cast the gauntlet to the only team in existence that can dispute their title of champions of the world in long-range shooting, and let them know no such word as "fail." The American breech-loading rifles are superior weapons, the ammunition is made with more care and precision, and there will be twice as many expert marksmen to choose from this year than there ever has been. The prospects of having the strongest team were never better for the Americans. Every long-range rifle club in the United States should come forward and cooperate. Send a challenge, appoint a committee to make plans for the selection of the team and adhere to them, and all America will surely respond to the call for riflemen. ONICKO.

Apropos to the above comes the following letter from a Dublin correspondent:—

DUBLIN, January 24th.

EDITOR FOREST AND STREAM:—

The Council of the Irish Rifle Association recently held a meeting at the Mansion House. The following are some of the members present, several of whom the American public are acquainted with, Major Leech, J. Rigby, Pollock, Joynt, H. Dyas, Alderman Manning, Dr. Trail, Major Bailey, G. O. Molley, D. F. Arnot, Messrs. Moyers, Sullivan, Burke, Kelley, Crofton and His Grace, the Lord Mayor of Dublin, who was elected chairman. After several questions uninteresting to Americans had been brought up and disposed of, Major Leech read a letter from the Secretary of National Rifle Association of America, which was to the effect, that at a meeting of the regular board of Directors held in November, a resolution was adopted that the Executive Committee be requested to consider and determine, after obtaining the views of the American team and of the foreign representative riflemen, upon the propriety of making any changes in the terms of international competitions for the Centennial Trophy to take place hereafter. The Executive committee complied with the foregoing resolution at a meeting on Dec. 1st, 1876, and instructed him (the Secretary) to communicate the same and inclose, at the same time, a copy of the original conditions, to the captains of the foreign teams who participated in the late international matches, with a request that they should consider the matter and inform the N. R. A. of their views. Major Leech then remarked that he had corresponded with the principal rifle clubs and riflemen of Ireland and found that they wished to hold the trophy in Ireland if successful till beaten by some duly recognized representative team. He thought that the performance of the Irish team in America proved that there was no mistake in the selection; the Australians were a splendid lot of men and very popular with the Americans; the Canadians and Scotch acted upright and fairly. The Americans have the greatest desire to engage in all pursuits capable or encouraging friendly relations, and that we had no doubt they would be glad to try their prowess on the English soil. (neither have I). Mr. J. Kelley then offered a resolution making the following changes in the condition of the trophy:—

RULE 1.—That each team shall consist of six men.

RULE 9.—That after the words, "shall prescribe" the following addition be made, "always provided such a place shall be a neutral range."

Major Smyly seconded the motion, but the chairman remarked that it was a serious thing to change these rules without having fully considered the propriety of doing so. Dr. Moyers concurred with him and moved as an amendment, that the matter be referred to the council with notice of an intention to move, that the rules be altered. Alderman Manning seconded the amendment, which was adopted as an original resolution. Mr. Rigby said, it would be a great pity to allow the International matches between the Irish and Americans to cease, and offered the following resolution:—

"That an invitation be addressed to the Amateur Rifle Club of New York, to send a team to Ireland in the present year, to shoot a match on the same conditions as the Irish-American matches of 1874–'75–'76."

Major Leech seconded the motion, which was adopted. A vote of thanks to the chairman was then passed and the proceedings terminated.

Hunting, horse racing, coursing, and foot ball, are occupying considerable attention now and the Royal National Dog Show is quite a success. AMERICUS.

N. R. A.—The Board of Directors of the N. R. A., held their regular meeting on Tuesday of last week. After the regular routine business had been completed, Captain Story offered the following resolution, which was carried; "That the Treasury be requested, to call at once upon the officers of the Long Island Railroad Company, in reference to the railroad tickets to Creedmoor for the coming season, and endeavor to have the rates fixed at a rate as low or lower than last season, and increased facilities given for their purchase in packets, and also endeavor to get the railroad company to leave tickets on sale at the office of the Association."

The following, offered by Gen. Woodward, was also adopted: "That the Secretary be instructed to communicate with the proper persons representing riflemen in each State of the Union, inviting them to participate in the inter-State rifle matches, to be shot at Creedmoor during the fall meeting. Resolved, that the Executive Committee be directed to prepare the terms and conditions of such matches."

Colonel Wingate offered the following resolution: "Whereas, The American team of 1876 has, in pursuance of the conditions of the Centennial Long Range Match, prescribed that the next contest for the trophy won by it at such match, shall take place at Creedmoor, in September next. Resolved, That the Secretary be directed to notify the various organizations of foreign riflemen of this fact, and to issue invitations (similar to those issued in 1876) requesting representative teams from different countries to participate in such match;" which, on motion, was laid on the table, with the understanding that it shall be in order at the next meeting of this Board.

The following, offered by Mr. Sanford, was seconded and duly adopted, viz.: 'Resolved, That the scores made in the Leech Cup Match of 1876, be published in the report of the National Rifle Association as part of the programme of the spring meeting."

The President announced the standing committees for the year 1877, as follows: "Executive Committee, N. P. Stanton, Col. G. W. Wingate, G. S. Schermerhorn, Jr., Gen. D. D. Wylie *ex-officio*, Gen. Alexander Shaler, Gen. Thomas S. Dakin, and Col. H. A. Gildersleeve, elected; Range Committee, Col. Geo. W. Wingate, Chairman; Capt. Joseph G. Story, and Col. G. D. Scott; Finance Committee, Hon. D. W. Judd, Chairman; E. H. Sanford, and Gen. W. G. Ward; Prize Committee, Col. John Ward, Chairman; Capt. W. C. Casey, and Major Joseph Holland.

—The Helvetia Rifle Club, an old and very favorably known association, will hold a Pool Meeting on February 22d, at the Union Hill Schuetzen Park, as advertised in our columns. We recommend our American friends to take part, as we are convinced that they will be well received.

MICHIGAN.—Our Milwaukee correspondent writes us as follows regarding rifle matches in that city:—

"The Milwaukee Rifle Club, like others in latitudes where the thermometer ranges below zero, is in a state of hibernation at present waiting for spring. When the 22d February comes we shall come out like the ground hog to take an "indication" and see what the chances are for the coming season. Nevertheless we sleep with one eye open. Certain sleuth hounds are on our track from the city of Ch-c-go with the intentention of "scooping" us in the spring time's pleasant weather. Owing to the generous hospitality of our Treasurer, Mr. Johnston, the members of the club have enjoyed the privilege of using his private gallery during the winter, and the amount of waste copper from the .22's we have used is frightful. Three of our bravest boys, Welles, Turner, and Fielding, tried the 1,000 yard range the other day but they didn't do much—they couldn't—the snow was too deep.

"We are not dead, only sleeping. Our club is compact, close, and we have money in the treasury and propose to keep some there. We enjoy unusual facilities at our ranges through the courtesy of our Vice President, Gen. E. W. Hincks, Commandant of the National Asylum for Disabled Soldiers. The only trouble we have is with our gentlemanly gunsmith, who will not, or does not, keep the Dittmar powder in stock. But he will doubtless wake up so that we can take a hand in the controversy and determine four ourselves whether 'saw-dust" will propel a bullet. (I think it will). TOMICK.

"OLD RIFLEMAN'S" LETTER.

FERRISBURGH, Vt., February 10th, 1877.

EDITOR FOREST AND STREAM:—

The rather spiteful rejoinder of "Howcolah" to the article of "An Old Rifleman," has aroused the indignation of some of your readers here, as your southwestern correspondent has so needlessly strayed from the subject to have a fling at Yankees and the "land of Yankeeisms." But the only notice worth taking of it is expressed in the subjoined note, handed me by an old gentle—*Yankee farmer*, I mean. R. E. R.

EDITOR FOREST AND STREAM:—

I am an old man, my shooting and fishing day's past and gone, but I take a lively interest in FOREST AND STREAM, which my son takes, and I fear you will injure it in the north and east, and among sensible people *everywhere* by publishing such ridiculous compounds of egotism, sectional jealousy, and "Secesh" spite, as that from the pen of "Howcolah" in your issue of 8th inst. Truly yours.

G. G. R

We cannot agree with our correspondent, and consider that he has placed an entirely wrong construction upon "Howcolah's" remarks. That writer is an army officer of high standing, and we believe a northern man, and because a letter dated from New Orleans says that "Yankees" were not so much accustomed to rifle shooting as the men of the south and the west, we see no reasons why such violent exceptions should be taken to it. We are satisfied that nothing in the nature of a slur was intended, and so far from "injuring our paper among sensible people," we think that such a result would be much more likely to occur from restricting liberty of opinion and expression.

CREEDMOOR, JR.—A rifle match was shot Saturday evening, Feb. 10th, at the Creedmoor Jr., underground, 00 yard range, between Arnold, Constable & Co.'s Centennial Rifle Team and the Journay & Burnham Rifle Club of Brooklyn. Conditions: Teams of 8, 10 shots per man, 100 yards off hand, any rifle. Result, victory for the A. C. & Co. team by one point. The scores are as follows:—

A. C. & CO. TEAM.		J. & B. CLUB	
Name.	Total.	Name.	Total.
B. S. Brown	42	M. McLachlan	42
A. A. Long	40	J. McKane	40
W. R. Brown	38	O. Regan	40
C. H. Fredrick	37	W. A. Lockwood	39
J. Maguire	37	W. R. Jarman	37
J. H. Fitzgerald	36	H. J. Gallagher	34
W. Marsh	35	J. M. Brayn	33
E. Bryant	33	E. A. V. Bonett	32
Total	358	Total	357

MILEY'S GALLERY.—The following is a record of last week's shooting, 10 shots at 120 feet range:—

Name.	Total.	Name.	Total
J. C. Kingsley	46	Geo. Glendenning	44
Chas. H. Jobr	46	J. L. S. Kelner	43
J. F. Burns	45	W. H. Dougherty	42
J. W. Wallis	44	J. J. Teevan	42

THE LEESBURG ACADEMY, which is advertised in our paper, offers to pupils a rare combination of facilities for recreation and study. The Principal is not only an ardent sportsman and angler, but an enthusiastic naturalist, and can teach the young ideas to shoot if anybody can. Situated in the Piedmont region of Virginia, and within easy access of Washington, both climate and location are altogether desirable.

ALBINO FLEAS: "Mary had a little lamb whose *fleas* was white as snow,"

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

—Wild fowl have returned from Currituck Sound and other North Carolina waters, where they were driven by the freeze in the Chesapeake. North Carolina gunners killed them in large numbers and found profitable markets. The fowl are now back to the Bush, Gunpowder and other rivers, and gunners are sending them to Baltimore in quantities.

—The red-heads at Currituck are moving slowly northward, and the common ducks are following them. The old residents claim that its something that they have not noticed for a great many years, and some think that it means that the winter is over. The members of Currituck Shooting Club had killed up to the middle of December, 1,391 ducks, 71 geese and 3 swan. On the 8th of November Josephus Baum killed 92 ducks and 15 geese. On the 20th of November he killed 146 ducks and 6 geese. On the 9th of December he killed 83 ducks, 32 geese and 3 swan. During the season he has killed 1,650 ducks, 77 geese and 3 swan.

—A correspondent asks why it is that the old wife and coot do not, as a general thing, pay much attention to decoys in Long Island Sound, when down on the bays on Long Island they shoot them by the hundreds over decoys. He thinks that it is either his luck to have them pay no attention to the decoys, or else they have too much water to circulate around in. We reply that these birds in certain seasons and in favorable weather, stool pretty well at other points on the Sound. Generally they come up to the decoys better early in the season, when they have not been much shot at, than later. Still, a friend of ours near Bridgeport, Conn., managed one morning during the last week in January to kill 39 old squaws in this manner.

The same correspondent further states that the other day he had a bunch of about one dozen broad bills come in to his black duck decoy. He fired both barrels into them, recovered two, and saw only two fly away. Could not see any more after looking for them. He asks if they would dive to the bottom if wounded, and hold on to the grass or anything else, and die there. Our impression is that every variety of duck, including the red-head, which is a surface feeder, will dive to the bottom when wounded.

REMOVAL.—Our esteemed friend, Jacob Glahn, formerly of West Meriden, has left the Nutmeg State and taken up his residence at Syracuse, N. Y., where he is now connected with Messrs. Nichols & Lefever, doing the ornamental engraving on the fine guns turned out by that firm. The best dog portraits which have appeared in our paper were drawn by J. G.

MASSACHUSETTS—*New Bedford, February 11th.*—I was out to-day riding through the country and saw a few quails and quite a lot of partridges, but I hear of many quails being found frozen under the snow drifts.

CONCHA.

NEW JERSEY—*Barnegat, February 18th.*—The oldest inhabitant acknowledges that there never were so many brant and ducks in Barnegat Bay as at present. Large swarms can be seen in every direction. We have had no shooting worth reporting for six weeks. They only made their appearance since the late warm spell. Our tides are running low now for much execution. As soon as full tides spring in you will hear of some big scores. B.

VIRGINIA—*Norfolk, Feb. 7th.*—Some few snipe flitting about. No quail killed by the cold weather around here this season. H.

SOUTH CAROLINA—*Beaufort, February 12th.*—The present has been an exceptionally good season for ducks in this State, but I have heard of no northern sportsmen visiting our waters in their pursuit. There is no risk of being frozen up. RUSTICUS.

WISCONSIN—*Dunnville, Dunn Co., Wis., February 9th.*—Snow all gone, and ground thawing out. A gentleman of a neighboring town says he saw on Sunday, February 4th, a flock each of wild geese and ducks flying north. The robins, which have not been known to remain here over winter before, are still here from 1876. The snow-fly, which does not make its appearance until spring comes, has been seen this month. Can it be they are all deceived? H. E. K.

KENTUCKY—*Stanford, Feb. 9th.*—That distinguished individual, so often quoted in these latter days, "the oldest citizen," never saw such weather as afflicted us for two thirds of the month of January. The mercury became thoroughly demoralized during the holidays and sunk to the degradation of 24° below zero, between which thermometrical graduations it fluctuated nearly three weeks. All that time a snow of unprecedented depth covered the ground, and thousands of quails and hares were slaughtered in the counties bordering the blue grass region and shipped to city markets. Great numbers of deer were killed in the mountain counties. A sporting friend wrote us from Louisville that he couldn't estimate the numbers of hares in that market, offered by many dealers at 25 to 30 cents per dozen. We congratulate ourselves that there are no pot-hunters in Central Kentucky, and as the cold and snow put a stop to shooting they were beneficial to the prospects of good quail shooting in the blue grass counties next season. We have had reports of many full coveys which survived the trying "spell." Some farmers assure us that the birds came into their barns and fed with domestic fowls during the severe weather, and if disturbed would rarely fly out of the building. For more than two weeks we have had spring-like weather, and angling is the rage. Many fine strings of bass have been taken, with minnows, from our smaller streams, and suckers caught by the thousands. Your humble servant and his diminutive friend, "Dilsey," an old bach., who tips the beam at 23 stone, were out yesterday, and made the boys' mouths water last evening when we displayed our catch of twenty-eight beauties. KENTUCKIAN.

LOADS FOR SHOT GUNS—PROPORTIONATE CHARGES.

EDITOR FOREST AND STREAM:—

Last fall while hunting with my brother in Illinois we had occasion, as most good sportsmen do, to make a trial of our guns, each, of course, believing his own the best. This trial was both for penetration and a good target. I used a No. 9 and he a No. 14, both double-barrel shot guns, muzzle-loaders. He had used his and none other for over twenty-five years, and yet it remained quite as good and true as the day it was purchased. From long experience he had learned just the best charge for this bore for average small game or general shooting. This was three drachms of good strong powder and one ounce of shot. I mention this load in particular because I have arbitrarily selected it as a unit of measure in my table below. I claimed for my big bore, in order to put our guns on the same footing, a charge of powder and shot each proportioned to his. In other words, that our charges should be to each other as the areas or surfaces of our bores. To this he readily agreed as being perfectly fair, since it placed both guns on terms of equality.

In the case of proportionate charges for guns of different bores it will hereafter appear that each charge fills an *equal length* in each barrel. This is evidently as it should be to ensure perfect equality, for then equal lengths or columns of powder propel equal lengths or columns of shot. Hence the equality is evident.

But again the *length* of proportionate charges for shot guns of different bores being the same it becomes a unit of measure for each; whence follows that each charge is represented in volume by unity or one multiplied into the area (or surface) of the bore. But since multiplying these different areas by one does not change their relations or ratios to each other we lay down the following fact as a key to our table given below, to wit:

RULE—That the proportionate charges of shot guns of different bores are to each other in the ratio of the area of their bores. Hence if these ratios be found they indicate the sizes of the relative charges, and to apply them we have only to assume the proper charge for any one bore or gun, and then to multiply this charge by the other ratios respectively and we find their loads.

I will give one example to illustrate the rule above: Let the areas of bores of two guns be represented, the one by 100 and the other by 50. If 100 be divided by 50 the quotient or ratio is two, thus the areas are as two to one; but the charges are in the same ratio as the areas, for they have the same unit of length (as above shown), hence they are as two to one also, which meets the proposition.

To continue my story. While we had agreed on the proportionate charge my gun was entitled to we were suddenly brought to a halt to know just what this charge should be. We had no table before us to refer to, and I was thrown upon my own generosity "to guess" my charge. I did so and got beaten in penetration, and felt badly, of course. I thereupon resolved to form a table to meet a like emergency perhaps hereafter. I now find I was beaten in penetration because I did not put in my due share of powder. Some will doubtless say, especially those using breech-loaders, that the loads in my table are rather light. I think not for 45 or 50 yards, and for pleasant shooting. Beyond this distance, for large game—ducks, geese, turkeys, deer, etc., I would increase the charges somewhat. Others will say, and very truly, that all guns of the same bore do not require the same amount of ammunition. I reply, such guns are exceptions to the general rule, as these may be loaded to suit them, but these exceptions will be found quite rare. I add that very light guns with large bores may not stand the heaviest charges in the table without too much recoil. These are exceptions also—load them more lightly, but this will be at the expense of penetration and wounded game.

With these preliminaries and explanations, which if dry reading to most may yet prove interesting to many, I will now present my table of charges. They are backed by a life-long experience with the shot gun, and are the best I can offer to all classes of hunters from young to old. They are void of extremes, work easy, and are sure up to about 50 yards for the muzzle if not for the breech-loader. At 30 yards No. 14 sent half its shot No. 5 through an inch pine board, and would have slayed half the chickens in the hennery, but fortunately they were out.

TABLE OF PROPORTIONATE CHARGES FOR SHOT GUNS OF DIFFERENT GAUGES FROM NO 4 TO 16 INCLUSIVE.

	Gauge numbers.	Diameters of bore.	Areas of bores.	Ratios of the Areas.	Loads of pow der ready.	Loads of shot ready.	No of pellets exactly.	
	4	1.03.	9137	2.45	7 1-3d.	2 7-16oz.	531	
	5	.99	7938	2.09	6 1-5d.	2 1-16oz.	449	
	6	.94	6932	1.82	5½d.	1¾oz.	397	
	7	.89	6277	1.67	5d.	1 13-16oz.	361	
	8	.85	5654	1.51	4½d.	1½oz.	329	
	9	.82	5275	1.41	4¼d.	1 7-16oz.	307	
	10	.79	4738	1.31	4d.	1 5-16oz.	286	
	11	.76	4521	1.21	3 2 3d.	1 3 16oz.	264	
	12	.73	4176	1.1	3 1-3d.	1oz.	244	
	13	.71	3960	1.06	3 1-3d.	1 1-16oz.	231	
Unit of measure.	14	.69	3736	1.	3.	1 oz.	218	Tatham's stand. shot, No. 6.
	15	.67	3516	0.94	2 4.5	.15-16oz.	205	
	16	.65	3228	0.86	2 3.5	.14-16oz.	188	

Such is the table of proportionate charges I present to your readers, especially to boys. They can at a glance select their proper load from it, and thus save themselves the trouble of writing you and asking, "how shall I load my gun?"

It will be seen the above charges are as the ratios in column for they are of equal lengths. The ratios, as will be seen, are constant quantities and may be readily used to construct other tables, and having more or less powder and shot according to fancy. Any other gauge and charge than 14 may be selected as a unit of measure. Having found the ratios they are to be multiplied respectively by the charge of powder and shot contained in the charge you have assumed as correct (and the unit), this will give all the proportionate charges.

In concluding I will add the table has been made with considerable care, and is believed to be correct for the purpose intended, and is otherwise reliable in useful data, not only for the sportsman but to the many others of your numerous readers. With this view I venture to submit it to the public through your columns, though at first intended only for private use. MAJ. H. W. MERRILL.

New Rochelle, Jan. 3d, 1877.

PIGEON MATCH.—Mr. George Loder, who has in his possession the Onondaga Club Medal, after many a sharp contest since last June, received a challenge from Mr. Henry Gale, which match came off on the 8th inst. The day was a very blustering one, and the birds were excellent strong flyers, The following scores shows that George intends to become owner of the beautiful prize: Henry Gale, 0, 1, 1, 0, 1, 1, 1, 1, 0, 0, 1, 1, 0, 1, 1, 1—10; George Loder, 1, 1, 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1—14. If Mr. Loder can hold this medal until next June, it becomes his property. G.

A KING AMONG PIGEON SHOOTERS.—Mr. Samuel King, of the Mullen House, at Barnegat, astonished some professional shots (as well as himself and friends) by scoring ten straight birds in a match for a new set of Barnegat decoys (thirty-six head) on the 10th instant. There were ten entries. Mr. King shot a number twelve Webley breech-loader, using one-quarter ounce less shot than his competitors—shot alternately from right and left shoulder, and without divesting himself of surplus clothing like others. B.

The Kennel.

DOGS AT AUCTION.—One of the most important auction sales of dogs, as regards the celebrity of the animals sold, ever held in this city, occurred at Major Barker's auction mart, Broadway and 39th street, on Wednesday of last week. A large number of spectators (but few ladies) were attracted to the sale, from the fact that it was generally known that the dogs to be sold were from the kennels of Mr. James Gordon Bennett. The following is a list and the prices they brought:—

No. 1.—Wh. bl. & tan setter dog, 3 years (?), Dr. Halbert.....$36 00
No. 2.—Wh. bl. & tan setter gyp, 3 years, Dr. Halbert.....$12 50
No. 3.—Wh. bl. & tan setter dog 14 years, Mr. W. H. Collender..$15 00
No. 4.—Wh. bl. & tan setter dog 14 years, Mr. G. J. Whitney..$12 00
No. 5.—Red setter gyp 14 years, Mr. Regan.....$ 5 00
No. 6.—Black setter dog 14 years, Mr. P. Muller.....$ 7 50
No. 7.—Clumber spaniel dog 3 years, Mr. Blasson.....$ 7 50
No. 8.—Clumber spaniel gyp 3 years, Henry Gardner.....$ 7 00
No. 9.—Cocker spaniel gyp 14 months, Mr W. P. Welch.....$17 00
No. 10.—Clumber spaniel gyp 14 months. Mr. Jas. Kent.....$16 00
No. 11.—Cocker spaniel gyp 14 months, Mr. Jas. Kent.....$18 00
No. 12.—Clumber spaniel puppy 3 months, Dr. E. Dodd.....$ 7 00
No. 13.—Cocker spaniel puppy 3 months, Mr. C. W. Barker, Jr..$ 3 00
No. 14.—Cocker spaniel puppy 3 months, Mr. J. R. Frankenheim.....$ 6 00
No. 15.—Clumber spaniel puppy 3 months, Mr. C. W. Barker, Jr..$11 00

Four Mastiffs (three of which were evidently a cross of St. Bernard,) brought $11, $10, $7, and $4. An indifferent pup sold for $21, and two Newfoundlands for $5 each. No.'s 1 and 2, were the "thousand dollar dogs," imported by Mr. Bennett. Poxey and Gill, we believe are their names. They were represented as being three years old, but as they have been in this country nearly that length of time, they are probably double that age. The gyps had canker of the ear very badly and the dogs taken as a lot were in very bad shape. No.'s 3 and 4 were out of this pair and were "fit to send to the breaker;" that is if a breaker could be found to take eighteen months old dogs, to say nothing of their almost painful timidity. The red gyp and also the black dog brought all that they were worth. The Spaniels were undoubtedly cheap, although they looked to us as being somewhat mixed in the breeding, several of them having ears that would have been small on a setter. One liver and white Cocker was really handsome. The Clumbers could not compare with those imported by Mr. Jonathan Thorne, Jr., and to us looked as though they had been crossed with the Cockers.

Some of our contemporaries have alluded to this sale as showing the low estimate in which sporting dogs are held hereabouts. We hold this to be an entirely erroneous impression. The fact that a dog has at one time been sold for a fancy price is no reason why the same value should attach to him to the end of his existence. Without field qualities of known excellence, or even being the getter of good dogs, we hold that No. 1 realized all he was worth. Because the unfortunate Marquis of Hastings paid twelve thousand guineas for Kangaroo, as a prospective Derby winner, and the horse was afterwards sold for a ten pound note to pull a harrow, it was no indication that thoroughbreds had decreased in value. If Mr. Morford was to send his Don, or Mr. Raymond his Lavercacks, or Mr. Munson his Gordons to auction, while they probably would not realize their full value, (for it is seldom that anything does at a forced sale) yet the prices would be far beyond those given above. The cheapest lot was undoubtedly the gyp, (No. 2) for as she is undoubted well bred; if sent to a good dog some puppies of excellence might be bred from her. But the dogs were sold without pedigrees or even *names* being given for them.

THE NEW YORK BENCH SHOW.—We can state that the project for a Bench Show in this city, although necessarily delayed owing to the impossibility of obtaining the desired location, is by no means abandoned. It will, probably, be held in May, or early in June, and as snipe shooting will then be over, dogs should be in good condition. The announcement that the Rod and Gun Club of Springfield will hold no show this year, will be received with regret. This has always been one of our most pleasant reunions for sportsmen, and many were looking forward to it with most pleasurable anticipations. As there will be no Chicago show either, the desirability of holding one in this city is still more apparent.

EASTERN FIELD TRIALS.—We have received from J. Addison Smith, Esq., of Baltimore, the following letter from Capt. Jno. M. Taylor, relative to proposed Field Trials in that vicinity. There is no reason why such an event should not be held next fall, and indeed we are informed that the matter is now in hand, and a programme shortly to be issued. That it would be a success in the hands of the gentlemen who have recently given so excellent a Bench Show we have no doubt, and the entries would be larger than for any previous event of the same character:—

BELLEFONTE, Va., February 4th, 1877.

J. ADDISON SMITH, Esq.:—

* * * * * * * * * *

Is there any chance of making a common cause, or combination of the sportsmen of Maryland, Delaware and Virginia, to unite in a society to inaugurate Field Trials this coming fall? It is conceded by all that the late show of dogs at Baltimore was the best ever held in America, and would it not be as well to add "Field Trials" to your already successful association? The pigeon fanciers would not complain, as they would have a grand opportunity of showing the performances of the "homers," and could from time to time during the trials test time and speed in flying the birds, and so carry the news to the press, which would create a sensation both at home and abroad, showing the usefulness of the carrier pigeon when many miles from the telegraph.

I need scarcely say to you or the gentlemen who take this important matter in hand, that I shall only be too pleased to give my time and what influence I may possess free. I would also be glad to see Lincoln, the Manager. It is true he does not understand the preliminaries at present, but if he will come and stay with me a week, I will do all in my power to make him the master of the art of "Field Trials," as in my opinion he is the best executive on the show bench.

The situation of the dog trials, whether held in either of the above States, would give the sportsmen of New York, Philadelphia, Boston, Baltimore, Richmond, and other minor cities, an opportunity to show the dogs in the field. The distances from these large and wealthy commercial cities to the ponds are comparatively short, therefore the railroad fares for sportsmen trains and dogs would not act as an excuse or as a prohibition to the entries. Where persons have to travel one thousand miles with the dogs and trainers, unless representing a club or society of gentlemen, they undoubtedly look at the cost. Mr. N. L. McCready, the President of the Old Dominion Line of Steamers, informed he that he would make a concession on the fare from New York to Petersburg, also along the route.

In Richmond and Norfolk there are influential Sportsmen's Clubs, both of which I am certain could be relied on for their hearty co operation. In Delaware there are many gentlemen, who take a lively interest in dogs, etc., one of which I believe was the originator of the "Gildersleeve stock of setters." Do not be behind hand in this new and pleasant pastime. It only wants somebody to start it, and then the trials will go ahead like your dog "Rowdy." With kind regards, I am your sincerely,

JOHN M. TAYLOR.

DUBLIN DOG SHOW.—This show was opened on the morning of the 24th January at the Dublin Exhibition Palace, under the auspices of the Royal National Dog Show Society of Ireland. The entries numbered 637, and the show was on the whole a success. Mr. Lort was the only English judge, the others being Messrs. R. G. Ridgway, D. Bellamy, Joseph Taylor, J. J. Pim, W. G. Merry, and Whyte. Single-handed judging was the order of the day, and as the judges had very spacious rings to compare the competitors in, they had great facilities in arriving at correct decisions. One thing was, however, against them —the paucity of keepers to lead the dogs, and the want of ring stewards to regulate and keep order.

The exhibition had the patronage of H. R. H. Prince Arthur, Duke of Connaught, as president, his Grace the Duke of Marlborough, and his Grace the Duke of Abercorn being vice presidents. Prince Arthur presented a very handsome shield for competition in the Irish setter classes, which trophy was won by a very fine young dog, the property of Mr. W. H. Lispcomb.

The following are the prize animals in the sporting classes:—

POINTERS.—*Dogs*—1st, J. S. Skidmore (Romp); 2d, J. G. Cronyn (Grouse). Highly commended—J. Pike, 2 (Ponto and Bean), J. C. Wilson (Bounce), and T. W. Webber (Scamp). Com.—W. Fitzsimmons (Don) and A. M. O'Ferrall (Bob II). *Bitches*—1st, J. Pike (Queen); 2d, W. F. Jarrett (Maggie). Com.—J. K. Rogerson (Juno), Capt. R. B. Irwin (Mec), and F. Moore (sappho.

SETTERS.—IRISH RED.—*Dogs*—1st, and Duke of Connaught's, W. H. Lipscomb (Shawn Bragh), 2d, Miss E. Donnelly (Bravo), 3d, T. M. Hilliard (Duke). High com.—J. Simpson (Pat), R. F. Hamilton (Rufus), G. Thompson (Young Dash), and M. Daly (Star II). Com.—W. J. Corbin (York IV), W. Hayes (Rinen), C. M. Bury (Don), F. Moore (Rake), W. U. Moutry (Brenan), P. Ryan (Carlo), A. J. Boyd (Dash), H. Pattison (Play), and T. M. O'Reilly (Grouse). *Bitches*—1st, J. H. O'Brien (Kate); 2d, S. K. Twigg (Kate); 3d, H. S. Moore (Bell). High com.—T. H. H. Rutledge (Nora), W. J. Corbett (Zella), Mrs. L. Faulkiner (Lily), C. Moore (Flora). Com.—J. K. Milner (Aileen), A. R. Wallace (Rhoda), J. M. Niall (Sal), J. H. O'Brien (Erin), P. A. Collier (Lotty), and E. McVey (Fan). RED AND WHITE—*Dogs*—1st, J. Staunton (Charlie); 2d, J. S. Skidmore (Grouse). High com.—P. E. Meredith (Rock), J. T. Richardson (Baron), R. Bowen (Grouse), A. B. Clary, (Shot), and W. Gallwey (Grouse). Com.—E. McVey (Grouse) *Bitches*—1st, J. J. Brady (Fan). BLACK AND TAN—1st, J. T. Richardson (Duke); 2d, H. J. Gallwey (Dot). High com.—H. L. Muloch (Baffie), J. T. Richardson (Belle), R. Murray (Lucy), G. P. Gray (Rake), and A. Ferrier (Venus). Com.—G. F. Townley (Rover).

—Mr. L. W. White's (of Bridgeport, Ct.) liver and white mottled pointer bitch was visited by Case's Morn on the 3d inst. The bitch is well-bred, of large size, and finely broken; her photograph already adorns our kennel department. Case's Morn, white and lemon in color, was imported in utero by Ex-Gov. Sprague, of Rhode Island, and is now in the kennel of S. S. Pease, of this city. From this union a fine litter should be expected.

SAGINAW BENCH SHOW.—This show is a fair one for the first attempt; the entries number over fifty, and comprise some very good dogs. The English setters are not well represented. The Irish are a fair lot; pointers are poor in quality. The hounds are a good lot, comprising some really magnificent dogs. Greyhounds and deerhounds are good. Terriers, especially the black and tan, are good. A splendid bull bitch is exhibited. The awards will be made to-morrow. C. Lincoln, of Detroit, is Judge, etc. Mr. A. Ferguson, the President, and Dr. J. H. Cowell, the Secretary, are very attentive in their duties.

CORRESPONDENT.

WAS IT WORMS, MEDICINE OR DISTEMPER?

EDITOR FOREST AND STREAM:—

The spirit which actuated Dr. H. G. Carey in reporting his unsuccessful case of canine therapeutics, in your issue of Jan. 25th, is most commendable, since it is often those very unsuccessful cases that give us most instruction, which alas! the sportsman, as well as the veterinarian, are too apt to withhold from the fashionable fact, that success is the magic word that every one of us like to see simprinted on our efforts, whether it be with the trusty breech loader, standing behind our fine blooded "Dandy," thrilled from center to periphey by the sudden whirr of the quickly rising quail, or with saddened and anxious heart watching the distressing symptoms of our faithful suffering "Dandy," with an earnest hope to read aright the disease of our dumb friend, that we may, with never failing (?) nostrum, or rational remedy carefully applied, restore him to health. I am more constrained to give my views in the cause of poor dead Dandy, as well as the living Dash, Sport, or Rake, from the fact that I feel especially invited, as one of the "some other correspondents," to put in my oar, and hence I beg leave to offer the opinion that Dandy died of an adquamic form of distemper, taking the Doctor's history of the case upon which to form an opinion.

The presence of the worms was a consistent, thin expulsion, partly the result of the anthelmintic effect of the calomel and santonine, and partly due to their once poisoned and relaxed state in common with the poisoned condition of the alvine secretions of poor Dandy himself.

Worms in the dog, like worms in the bowels of human beings, rarely, if ever, prove fatal to the patients, especially in ten day's illness. There is scarcely a young dog in existence, or a young humaa being either, that has not within the alimentary canal, worms, more or less in number, so that in brief, they nearly all "have worms."

The certificate of death, Mr. Editor, of Dandy, which you suggest, of "too much medicine," can scarcely hold good, since the doses were moderate, and entirely safe for a setter of ordinary size, but rather let your verdict be, that Dandy did not get enough of the right kind of medicine early, viz., quinine in specific and sustaining doses, say three to five grains, two or three times a day, controlling the heart's action to about 100 in a minute by carefully guarded doses of tincture acouite, say one drop every three hours. The pulsations of the heart being counted by means of the fingers applied over the lower part of the dog's chest between ribs.

I don't regard quinine as a specific in distemper, but in this case it would admirably answer the purpose of counteracting the overwhelming of the dog's vital powers, by the distemper poison.

Distemper is a specific disease, of protean forms, and may attack a dog with worms, and so affect the parasites and secretions of the patient as to cause their expulsion.

It is also a disease that exerts a powerful poison upon the vital functions of the animal, and has a predilection for exerting its poisonous influence upon mucous membrane. Generally that being the nasal and respiratory organs, but also at times, apparently avoiding these mucous passages, and spending its violence upon the mucous membrane of the bowels and causing death by poison, depression and exhaustion of the vital functions of the animal.

Santonine may be regarded as entirely reliable as a vermifuge for dogs, and perfectly safe in the proportion of from one to two grains to every twenty to fifty pounds of dog, the drug to be administerd night and morning. Areca nut, is undoubtedly an active vermifuge, but more irritating, and certainly less safe than santonine

SOUTH FORK.

We cannot agree with our correspondent, that Areca nut is less safe than santonine; on the contrary, we believe just the opposite to be the case, and in this connection the following paragraph which we find in the *Druggists Circular*, may be read with interest. It is headed "Dangers from Santonine."—

"In using santonine, it is well to bear in mind that comparatively small doses have produced convulsions of somewhat grave character. A German paper lately reported a case in which poisonous effects were produced in a child two years old by the ingestion of so small a dose as a grain and a half. Convulsions commenced in the face and extended to the extremities, while the respiratory action was greatly impeded. Under warm baths, enemata, and artificial respiration, the patient recovered. The physician in charge of the case then instituted a series of experiments on the lower animals, and found that chloral and ether inhalation controlled the convulsions produced by santonine. He naturally argues that the same treatment should be pursued in the human subject when a poisonous dose is taken."

SANTONINE FOR WORMS.—"I do not accept as true your assumption, that my pup Dandy died of too "much medicine." I do believe, however, that *areca nut* or any other remedy that would have secured the expulsion of the worms at the time the first ones were discharged had been administered, that his life would have been saved. With the reputation that it has acquired through the FOREST AND STREAM if areca nut had been at hand at this stage of the case I should certainly have administered it instead of the calomel and turpentine. While I was waiting for you to send it to me I read up on anthelmintics and found that *santonine* took the lead of all other articles for the destruction of worms, and I administered it with the results named in the two cases I sent you for publication.

I do not desire to be regarded as urging objections to areca nut further than this: so far as I know it is not generally kept by apothecaries, and before it can be procured from New York, some acute cases of disease produced by worms might prove fatal. On the other hand santonine is kept by almost every druggist, is easy of administration, and certain in its action. H. G. CAREY.

Indianapolis, Feb. 1st, 1877.

One of the principal reasons why we recommend areca nut for worms in dogs is because we believe its qualities extend beyond the mere expulsion of worms. It is an excellent tonic and acts as a stimulant, or, so to speak, condition powder; and when worms are merely suspected, not known positively to exist, the dose of castor oil which follows the areca nut, may in itself be the best remedy which could be given.—ED.

DR. WEBB ON DISTEMPER.

NEW YORK, Feb. 4th, 1877.

EDITOR FOREST AND STREAM:—

You have asked me for a *short* and *concise* article upon "Distemper and how to treat it." I cannot give what you ask nor do I believe any man can. Especially when you consider that the article will be read and used by men who have little or no experience in medicine, or in diagnosticating diseases. Then I do not think there is such a disease as distemper. To be sure, my experience has not been so very large, but such as it has been during the past three or four years, combined with my knowledge of medicine, has failed to convince me of its existence. I have treated each year very many cases of so called distemper, and in every case I have been able to diagnose a distinct disease, and only through ignorance had the owners thrown aside the proper name and given it a new one, "Distemper;" and from the promiscuous manner in which the word is used, to designate almost every ill that dog is heir to, arises great confusion and oftentimes serious harm; and it appears to me that unless used properly it had better be dropped entirely, for at present it signifies nothing, unless it be that the animal is sick. I have found Pneumonia to be the most common desease among dogs, where medical skill is called into requisition, and second in importance is intestinal colic and purging. I have lost but two dogs during the past three years, one from pneumonia and one from inflammation of the bowels, and both of them I treated, so to speak, by letter, never having seen the animals. Pneumonia generally exhibits itself in the same manner as it does in man, there is a chill or chilly sensation; the dog shivers, is dumpy and sleepy, and yet very restless and unable to sleep. The breathing is quickened, likewise the pulse, the nose is hot and the eyes bloodshot. Soon the nose and eyes discharge a thick purulent matter; a sharp, dry cough is heard, and now and then a teaspoonful or so of greenish matter is vomited from the stomach. As the dog improves the vomiting is less frequent the discharge from the eyes and nose ceases, and all the organs return to their normal state. These symptoms are all present in a severe case, and in many slight attacks some of them will be wanting or present only in a slight degree.

When I have made up my mind that a dog has pneumonia, I give twenty grains of calomel in powder dry on the back of the tongue, and commence immediately with four grains of quinine four times every 24 hours, provided the dog is one year old. Should the calomel move him too freely, give thirty drops tinct. opium in 2 ounces of starch water as an enema, after every passage, until the evacuations are less frequent. To those who prefer it, in place of calomel, give four grains of blue mass every alternate day until two or three doses are taken, or, three compound carthartic pills first day. I prefer the calomel, though I acknowledge the dog then needs to be more carefully watched. The dose of calomel may, to some unaccustomed to its use seem very large, but I have given ten grains of calomel with excellent results to a puppy three months old. During the course of the disease the animal needs to be kept in a *warm, dry comfortable* place, and nourished with strong soups, beef tea, milk, bread, etc. Should the pain become very severe one grain of opium in pill will relieve it. When the breathing is labored and rapid, half teaspoonful of the comp. syrup of squills every four hours until vomiting is produced, will afford immense relief. The urine may become scanty and high colored; a teaspoonful of the best sweet spirits of nitre, repeated will in most cases change the quantity and quality of the secretion. The disease may last from one week to six weeks. I have rarely, however, seen it last more than three. I would advise any man having a valuable dog showing signs of the disease to consult at once the best physician in the place. At some future date I will give you a few lines on intestinal colic, and inflammation of the bowels, which I hope may be of service to your readers.

YACHTING FETE AT ST. AUGUSTINE, FLA.—The St. Augustine *Press* of Feb. 3d, gives the following description of a novel aquatic entertainment which will bear imitation in other waters:—

"The arrangements for an Aquatic Concert at full moon appear to have been carefully and even elaborately, though quietly made by a number of liberal gentlemen, consisting of military and naval officers, in connection with the ever active and enterprising managers of the St. Augustine Yacht Club, which is chiefly composed of wealthy gentlemen who winter regularly at this place.

"Promptly at half-past seven o'clock the fleet of beautiful yachts lying around the wharf were seen to commence a series of well concerted movements. The admirable band of the 5th Artillery quietly took seats in one of the larger yachts, and with their silver instruments, glided off to the U. S. Coast Survey Steamer Bache. A line of yachts was then formed in the offing, immediately in front of the town, decked in all the colors of the rainbow with lighted Chinese lanterns. A number of blazing rockets and Roman candles called the party together, and soon the main body of the fleet, filled with ladies and gentlemen, began to move off in order, and to circle round the Steamer, while citizens and others not actively participating filled the wharf and lined the shore.

"Just as the circle was completed a cannon shot from on board the Bache, announced the opening of the Concert. At once the band performed a soul-stirring air, and a gen-

tle breeze rising, the cordon of yachts sailed gaily around the steamer. The band poured a flood of sweet melody upon the still night air, and the flood of water laved the graceful craft, whose gay wings, snowy with moonlight, flashed from all directions upon the ravished eye of the beholder. Rosy and golden lights gleamed from the boats with long tracks of brilliancy across the rippling water, while the new lighthouse, as though unwilling that other lights should outshine it, shrunk and grew again, and, glowing with unusual splendor, sent a gorgeous pathway of pellucid light heavenward athwart the bay."

THE HISTORY AND CHARACTER OF PAPER BOATS.

Inquiries regarding the history and durability of paper boats occasionally reach me through the medium of the post office. After all the uses to which paper has been put during the last twenty years, the public is yet hardly convinced that the flimsy material, paper, can successfully take the place of wood in the construction of light pleasure boats, canoes, and racing shells. Yet the idea has become an accomplished fact. The success of the victorious paper shells of the Cornell College navy, which were enlisted in the struggles of the two past seasons at Saratoga, against no mean antagonists—the college crews of the United States—surely proves that in strength, stiffness, speed, and fineness of model the paper boat is without a rival.

When used in its own peculiar sphere, the improved paper boat will be found to possess the following merits: Less weight, greater strength, stiffness, durability, and speed than a wooden boat of the same size and model, and the molded paper shell will retain the delicate lines so essential to speed, while the brittle wooden shell yields more or less to the warping influences of sun and moisture. A comparison of the strength of wood and paper for boats has been made by a writer in the Cornell *Times*, a journal published by the students of that celebrated New York college: "Let us take a piece of wood and a piece of paper of the same thickness, and experiment with, use and abuse them both to the same extent. Let the wood be of one-eighth of an inch in thickness—the usual thickness of shell boats—and the paper heavy pasteboard, both one foot square. Holding them up by one side, strike them with a hammer, and observe the result. The wood will be cracked (to say the least), the pasteboard, whirled out of your hand, will only be dented, at most. Take hold and bend them. The wood bends to a certain degree, and then splits; the pasteboard, bent to the same degree, is not affected in the least. Take a knife and strike them, the wood is again split; the pasteboard, only pierced. Place them on the water, the wood floats for an indefinite time; the pasteboard, after a time, soaks, and finally sinks, as was to be expected. But suppose we soak the pasteboard in marine glue before the experiment, then we find the pasteboard equally as impervious to the water as wood, and as buoyant, if of the same weight. But to be of the same weight it must be thinner than the wood, yet, even then it stands the before mentioned tests as well as when thicker; and it will be found to stand all tests much better than wood, even when it weighs considerably less.

"Now, enlarging our pieces, and molding them into boats of the same weight, we find the following differences:—

"Wood, being stiff and liable to split, can only be molded into comparative form. Paper, since it can be rendered perfectly pliable, can be pressed into any shape desirable, hence, any wished for fineness of lines can be given the model, and the paper will assume the identical shape, after which it can be water-proofed, hardened, and polished. Paper neither swells, nor shrinks, nor cracks, hence it does not leak, is always ready for use, always serviceable. As to cost, there is very little difference between the two; the cost being within twenty-five dollars, more or less, the same for both. Those who use paper boats think them very near perfection, and surely those who have the most to do with boats ought to know, prejudice aside, which is the best.

An injury to a paper boat is easily repaired by a patch of strong paper and a coating of shellac put on with a hot iron. As the paper boat is a novelty with many people, a sketch of its early history may prove interesting to the reader. Mr. George Waters, the son of the senior member of the firm of E. E. Waters & Sons, of Troy, N. Y., was invited some eleven years since to a masquerade party. The boy repaired to a toy shop to purchase a counterfeit face; but thinking the price (eight dollars) was more than he could afford for a single evening's sport, he borrowed the mask for a model, from which he produced a duplicate as perfect as was the original. While engaged upon his novel work, an idea impressed itself upon his ingenious brain. "Cannot," he queried, "a paper shell be made upon a wooden model of a boat? and will not a shell thus produced after being treated to a coat of marine varnish, float as well, and be lighter than a wooden boat?" The boy turned his attention to the development of his bright idea; and being crowned with success, he was soon "paddling his own canoe"—the first paper boat—upon the river. That first crudely constructed paper shell is still a good boat. The father of George, an inventor of many successful mechanical devices, now applied his energies, time and fortune, to the perfecting of the paper boat; and though his firm has struggled against the prejudices of the world, and losses both pecuniary and incendiary, the great effort has been rewarded by success as well as by the approbation of thousands of enthusiastic friends.—N. H. Bisnor, *in the "South,"*

SCHOOL OF NAVIGATION.—The Provincial Government of Quebec has made provision for establishing a School of Navigation for that Province. The institution was to have gone into operation on the 1st of February. The school is directly under the control of the Government, and W. C. Seaton, Esq., late Nautical Master to the Society of Merchant Venturers, Bristol, England, has been secured to superintend the institution. The fees are $15 for those wishing to pass for a mate's certificate, and $20 for those wishing a captain's certificate. No further charge is entailed until certificates are obtained.

HARVARD AND YALE.—The Yale *Record* of the 3d inst. says:—

"It will not be pleasing to hear that unless a considerable amount of money is raised by a month from to-day no race will be rowed with Harvard this year."

—Mrs. Elizabeth Goose—otherwise "Mother Goose"—died in Boston in 1757; and here is the Rev. J. L Manning, pastor of the new Old South Church, asking that a memorial statue should be erected to the venerable lady in one of the parks or squares of that city.

National Pastimes.

BASE BALL.

The base ball season bids fair to open early this year, and already the notes of preparation are to be heard. About forty regular professional clubs will enter the arena, of which but six will be League clubs, viz., four from the west and two from the east. The Philadelphia Athletics will join the International Association which will be the majority association of the country.

—A call has been issued for an Amateur Convention of genuine amateur clubs to meet in this city on March 14th. But it will be difficult to find regular amateur clubs enough to organize the meeting. There is one in New York, the old Knickerbockers, and one in Brooklyn, the Nameless, the other clubs are nearly all gate money amateur nines and not eligible to send delegates under the call in question.

—Base ball games at Prospect Park are expected to begin about the last week in March judging from the mildness of February weather thus far. The ball players are eager to take the field.

SKATING.

Prospect Park ended up forty-four days of skating this season on February 10th, and the same day the Capitoline Lake had its fifty-third day of skating. The sun has become too powerful for the ice now, and the chances are that the ice skating season is nearly over.

—Roller skating is still on the increase, and new halls are springing up rapidly. On Monday night Apollo Hall in Williamsburg was opened for roller skating, and a hall in South Brooklyn is to be opened for the same exercise next week. As soon as the lease of the Hippodrome trotting race management expires that place is to be transferred into a large roller skating palace.

—At the Brooklyn Rink, on February 8th, there was a larger attendance on the occasion of the third fete night entertainment than at either of the previous fetes, and on Saturday fully two thousand people were on the floor during the afternoon and evening.

New Publications.

THE PLAINS OF THE GREAT WEST. By Col. R. J. Dodge, U. S. A., with an Introduction by Wm. Blackmore. G. P. Putnam's Sons, Publishers, 182 Fifth avenue, New York.

This is by far the most comprehensive and intelligent volume that has ever been written of the Far West. It is alike invaluable to the sportsman, the settler, the overland traveler, the trapper, and the soldier. It is written in the plain language of "one who has been there and knows." The economy, strategy, diplomacy, expedients and vicissitudes of the Plains are here so intelligently stated that any one who reads may profit thereby with material advantage. Next to the compass, this book becomes a necessity. To be without either involves great personal risk and detriment. In 1856, Lieut. Ruxton, of the British Army, gave us in homely but well chosen language the first truthful information we had received of the physical characteristics of the Far West and its nomadic inhabitants; its marvellous scenery and wonderful resources; and the startling vicissitudes of a life there spent. Except through the few gleanings from the observations of overland gold seekers bound to California, and the Mormon emigrants, the whole region had been a sealed book. Ruxton covered the whole ground, sufficiently it is true—yet little escaped his observation. The Bad Lands, the wonders of the Yellowstone, the gold of Pike's Peak, the Boiling Soda Springs, all new and startling terrestrial phenomena then are at this day verified, just as he described them. But much of what was to him a wilderness now blooms with grain fields, and is resonant with the hum of industry. Ruxton at that time advised well as to the policy to be pursued with the Indians; and his advice, if followed, would have brought peace instead of perpetual war. What he predicted as to the destruction of the game of the country has proved true. It was the good fortune of the writer to have crossed the Plains at the time of Ruxton's campaigning, and he is thus enabled to make those intelligent comparisons which help to form an opinion of the value and authenticity of a work like Col. Dodge's. In an article published in *Harpers Magazine*, in Oct. 1857, he indorsed what Ruxton had then said, and nothing has since occurred to reverse the opinions of either.

Subsequently Max Greene wrote a very truthful book entitled the "Kansas Region," which then included a vast territorial area, now divided into several States, dwelling particularly upon the climate and agricultural resources of the country. This was a most valuable little work that should have enjoyed a large circulation. "The Prairie Traveler," by Gen. Marcy, is another book of great use to any one crossing the plains, containing many instructions to govern the movements of bodies of troops, and which are equally well adapted to sportsmen and hunters. This is a feature likewise of Col. Dodge's book. As regards the game of the country, the author devotes no less than 144 pages to it alone. Any of our sporting readers, therefore, who have ever turned their loving eyes westward, will lose no time in giving the book a thorough perusal. We shall place it on our shelf for constant reference. The price is $4.

A MAD WORLD AND ITS INHABITANTS. By Julius Chambers, New York. D. Appleton & Co.

Mr. Chambers's experiences in a lunatic asylum, now offered in book form, will not be altogether new to the American public. They are, however, deeply interesting, both in respect of their own peculiar character and of the legislative reforms to which their original publication led. The book is a result of that enterprise which pervaded every branch of American journalism. The laws regulating the admission of patients to lunatic asylums, and their treatment when immured called for exposure, and the author undertook the task. He details with a grim humor the course of study, and the preparation necessary for a candidate for a certificate of lunacy, and then shows how successfully he passed his own medical examination, and was, by the doctor's *fiat*, transformed into a madman. Then came the horrors and abuses of the asylum, relieved by clearly drawn portraits of his fellow patients. Statements are made respecting the brutality of the keepers, which appear almost incredible. The author succeeded in demonstrating, firstly, the indifference and easily satisfied ignorance of the examining "experts," secondly, the careless neglig ence of the judge who granted the warrant for his committal; and thirdly, the admirable condition of the asylum. In other words, he showed that all the usages and laws relating to the confinement and treatment of the insane were erroneous, and that the entire system was rotten. This was no mean achievement, and nothing but courage and a strong sense of duty could have carried him through even his brief term of imprisonment. He let light in upon one of the darkest spots of the social fabric, and led people to question if the semi-starvation, kicks and cuffs of the asylum were calculated to re-seat reason "in her throne." The style in which the story is told is in every way admirable.

THE YELLOWSTONE NATIONAL PARK. By Prof. Thomas C. Archer, Edinburgh, Scotland:

Already the European public is awakening to the knowledge that there is, far away in the center of North American, a district more realy wonderful than any which the most inventive fiction-writer has ever imagined, and full of interest, as we are told by the Earl of Dunraven in his inimitable book, "The Great Divide," and by others who have explored this Wonderland. The *Illustried London News*, not very long ago, gave numerous excellent engravings of the most remarkable points in that large space of 500 miles, which has been set aside by the United States Government in perpetuity as a public park or recreation ground. But it is admitted by every writer, on the subject, that it is all but impossible by words to convey the slightest idea of the remarkable natural features of the district, large portions of which volcanic, and diversified with geysers, which for number and grotesqueness throw those of Iceland into the shade. Neither can engravings, or even photographs, give much more satisfaction, for the most astonishing of all the wonders is that of color. There the rocks and mountains and the twisted and distorted masses of earth are tinted with brilliant colors—red, orange, yellow, &c., such as we have never been accustomed to associate with them, and which, consequently, render them different in their physical aspects to any thing before seen. So much did this impress the indefatigable, Professor Hayden, when he was the geologist in charge of the Government exploration and survey of the district, that he obtained subsequently the service of a very skilful British artist in water-colors, to take on the spot colored sketches of some of the most beautiful and remarkable scenes in the district. Mr. Moran's beautiful drawings bear testimony to the fact that no pains had been spared to make them faithful representations of the remarkable scenes they represent. To give equally trustworthy reproductions of these drawings, was most desirable, so that the marvels of Wonderland, as it is often now called, might be seen by all the world. This has been done in a very magnificent volume published by Messrs, Prany & Co., of Boston, U. S. It contains fifteen chromolithe, of such excellence, that we are surprised to find that firm, eminent as it is, bringing out so large a work in a style which would do credit the Imperial State Printing Establishment of Austria, long so famous for its perfection in the glyptic arts. There is a softness and aerial depth not often seen in chromoliths, and as the work has been brought out under the careful supervision of the eminent geologist who surveyed the country, we have ample guarantees that the drawings are faithful representations. The work is necessarily a costly one, but no public library can well do without it; and to those who can afford to put it in their libraries, it will be a great source of pleasure. The letterpress description of the pictures is by Professor Hayden himself.

FIELD AND FOREST. Very interesting and valuable is the article from the pen of Mr. David Scott, with which *Field and Forest* for January opens. While the Tendency in Birds to Vary their Habits is a topic which might be made to fill a volume, Mr. Scott in the brief space which he occupies has treated the subject in an able manner, and although we by no means agree with him in some of the deductions which he arrives at, we welcome his article as an additional evidence of the new and more philosophic spirit which is pervading science. The time has passed when the description of new species was the sole end and aim of each Naturalist, and at present the *leaders* in science are devoting themselves to gathering facts looking to the establishment of general laws.

An article on *Doryphora decemlineata* gives some interesting facts with regard to the habits of this destructive beetle, and should be read by agriculturists. We notice also a valuable catalogue of the Mosses of the District of Columbia, prepared by Mr. Rudolph Oldberg. There are several shorter articles, all of them instructive.

Field and Forest is a monthly periodical of much value, printed at Washington, and we wish for it the success it so well deserves; only we would prefer if it had not so nearly appropriated our own title.

In the *Naturalist* for February we are given a most attractive account by Dr. Thomas H. Streets, of the Natural History of the Fanning Group of Islands of the Pacific Ocean. Dealing with the fauna of an almost wholly unknown region, Dr. Streets's paper is instructive and valuable. A somewhat detailed account is given in the next article of the Explorations made in Colorado in 1876 by Dr. Hayden's Survey, the main points of which have already been published in this journal. Messrs. D. H. Jordan and H. E. Copeland furnish notes on the habits of the Sand Darter, and Wm. B. Flint writes on the Distribution of Plants in New Hampshire and Vermont. An article by Prof. Cope on the Sucessonian Fauna in North America gives in popular form the details of recent geological discoveries in New Mexico, by which the Eocene beds in that territory have been found to be of the same age with the Lower Eocene of France and England. The author also quotes at some length from the celebrated Lartet in reference to the increase in the size of the mammalian brain from the early Tertiary to the present time. We notice, however, that, through some inadvertence, the Professor has omitted to mention in this connection the name of Marsh, whose researches in this direction have been regarded as so important by all paleontologists. The other articles of the number are on the Vitality of Certain Land Mollusks by R. E. C. Stearns and Barnacles by J.S.Kingsley. The General Notes are interesting and the Scientific News and Proceedings of Societies cover a wide field.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Baths.

Russian Vapor, Marble, Baths.

NO. 25 EAST FOURTH ST., NEAR BROADWAY

The most extensive, luxurious and popular baths on this continent. Call and see the testimonials, signed by the most eminent physicians of the city, to their value as a remedy in Cold, Catarrh, Sore Throat, Gout, Rheumatism, and many other affections which originate in an inert skin. dec7 3m

The Kennel.

The St. Louis Kennel Club.

(C. B. WHITFORD, TRAINER.)

are the owners of the following dogs:

ROCK, an imported English setter (formerly owned by Luther Adams, of Boston.) He was a field-trial winner in England, and won first at the Springfield, Chicago and St. Louis bench shows. Also won first at Baltimore (1877), the Special prize for the best setter in the show, and other Specials.

ELCHO and ERIN, both imported red Irish setters. Elcho won first at the Chicago Show; was a winner in the Pappy class in Ireland, and first prize at Baltimore (1877). Is sire of Aileen, the red Irish bitch which won first at the Centennial bench shows and of Norah, who won 1st at the St. Louis show. ERIN won 2d at Chicago in the Open class, and 1st as the best Irish setter for stock purposes shown with two of his get. HE WON THE "GREENWOOD CUP" IN THE FIELD TRIALS LATELY HELD AT MEMPHIS, ALSO WITH DRAKE WON FIRST IN THE BRACE STAKES.

The price for the service of either of the above dogs is thirty-five dollars.

The club are also the owners of the imported English setter bitch Dora. She is either the dam or grand dam of all the "blue blooded" English setters that have won prizes at field trials in this country.

They also own the English bitch ROSE and the red Irish bitches LOO II. and ROSE. The English setter bitch Rose is by Rock, out of the pure Laverack bitch Pickles. LOO II. and the Irish bitch Rose are both bench show winners. Address,

ST. LOUIS KENNEL CLUB,
Jan11-tf 706 Pine St., St. Louis, Mo.

Sportsmen's Goods.

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT," made by C.W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

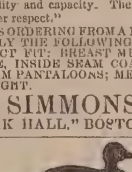
"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports man has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is waterproofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.



In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,

"OAK HALL," BOSTON, MASS.

DECOYS.

WIND-PROOF

Leather Vest and Jackets, Flannel-Lined.

(Made and sold only by Messrs. G. W. SIMMONS & Co., OAK HALL, BOSTON.) are considered the most sensible protectors ever devised for winter wear They are especially adapted to the requirements of sporting men, whose rapid walking is likely to be followed by frequent halts in the cold wind. Price, Vest $7, Jacket $9. Measurement required are Waist, Breast and Inside Seam of Sleeve. Mention Height and Weight.

LADIES LEATHER VESTS AND JACKETS made to order. Indispensible to all who are in any way exposed to the weather.

G. W. Simmons & Son,

32 to 38 North 2t., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distance to keep from the rail-shooters, the Brant men, and the chicken killers respectively, to be safe. They have 'got them all down fine.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a shrill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holsbird! Scatter! you beggars, scatter!'—FOREST AND STREAM.]

H. L. DUNCKLEE'S

PATENT

CAMPING and MINING

STOVE.

PATENTED JUNE 22, 1875.

Outside dimensions, packed, 12x12x20 inches.

Weighing only 35 pounds, very durable, will cook for ten persons, and is especially adapted for camping purposes. The ware consists of 8 qt. kettle, 6 qt. tea kettle, 2 qt. coffee pot, fry pan, round tin pan, 2 square pans, dipper, gridiron, tent collar, 8 ft. funnel, and an oven that will roast 15 pounds beef.

The ware is so constructed that it nests and packs in the oven, and the oven and funnel pack inside the stove, as represented in cut 2, leaving room for packing half a dozen plates, knives, forks, spoons, and drinking cups. Price complete, $15.

Musical Instruments.

Highest Honors
AT THE
CENTENNIAL WORLD'S FAIR, 1876!
THE
SHONINGER ORGANS

PRONOUNCED UNANIMOUSLY AS THE

Best Instruments,

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:—

"The B. SHONINGER ORGAN CO.'S exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.

New styles and prices just issued, which are in accordance with our rule, the BEST ORGAN for the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to

A VICTORIOUS INVENTION.

SMITTH'S EAGLE CLAW.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operations.

It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape.

It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

PRICE LIST:

No. 1—For fishing and all kinds of small game and animals sent by mail.....50 cents
No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, &c.....75 cents
No 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, &c. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight 20 to 15 lbs. $10

All goods sent charges paid to any address on receipt of price. Adress

Chas. L. Coate,
480 Fulton St., Brooklyn, N. Y.
P. O. Box 214.

ATTENTION, WATCH SPECULATORS!

We have the best Imitation Gold Watch in the Market for Trading Purposes.

The metal is a composition of other metals, so closely resembling gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE SWISS OR AMERICAN MOVEMENT. SUNK DIAL. CHRONOMETER BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM $150 TO $200. It sells and trades readily, for from $60 to $100, and if you wish a watch for your own use or to make money entirely this. Owing to our large sales, we are enabled to reduce the price of them to $12 EACH WITH AN ELEGANT CHAIN ATTACHED.

They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of $12, to any part of the Country, or it will be sent C. O. D. when the customer desires and remits $3 on account. These Elegant CHAINS weigh about fifty pennyweights, and the same pattern in pure gold would cost $100. We sell these Chains at $3 each. But we sell the Watch and Chain for $12, sent by Mail in a Registered Package, post-paid, to any Post-Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR TEN DOLLARS.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only*.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 3½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration*. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 12½ and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist*. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's agents in every prominent city, or wholesale at our office

88 Wall Street, New York.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The *strongest* and *cleanest* Powder made. Nos. to 7, packed *only* in sealed 1 lb. canisters. The coarser sizes (higher numbers) especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6¼ lbs. each, and in canisters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g. FF.g, FFF.g, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6¼ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less residuum than any other brands made.

BLASTING, MINING, AND SHIPPING POWDER OF ALL GRADES AND SIZES PACKED IN WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING APPARATUS.

LAFLIN & RAND POWDER Co.,

26 Murray St., N. Y.

Sole proprietors and manufacturers of the celebrated ORANGE brand of GUNPOWDER. Recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

CHALLENGE.

The undersigned is prepared to prove all the superior qualities he claims for his powder.

Safety, Cleanliness, Strength, Little Recoil, Little Smoke, Small Report, Less Heating of the Barrel in Rapid Firing, and its Regularity in Shooting.

He challenges all riflemen to shoot against him with black powder, 200 rounds, without wiping; 100 rounds off-hand, at 200, 500 and 1,000 yards respectively, and 100 rounds in any position at same distances; the 200 rounds equally divided at the three ranges; sighting shots extra.

Will shoot for money if desired.

The powder is also well adapted for shot guns.

Of saline coves you'll find the precious wedges
With backs up, lurking in the sandy bottom;
Pull in your iron rake, and lo! you've got 'em!
Take thirty large ones, put a basin under,
And cleave with a knife, their stony jaws asunder;
Add water (three quarts) to the native liquor,
Bring to a boil (and, by the way, the quicker
It boils the better, if you do it cutely),
Now add the clams, chopped up and minced minutely.

Allow a longer boil of just three minutes,
And while it bubbles, quickly stir within its
Tumultuous depths where still the mollusks mutter,
Four tablespoons of flour and four of butter,
A pint of milk, some pepper to your notion,
And clams need salting, although born of ocean,
Remove them from the fire; (if much boiled they will suffer—
You'll find that India rubber isn't tougher).

After 'tis off, add three fresh eggs, well beaten,
Stir once more, and it's ready to be eaten.
Fruit of the wave! O dainty and delicious!
Food for the gods! Ambrosia Apicius!
Worthy to thrill the soul of a sea-born Venus,
Or titillate the palate of Silenus!

—*W. A. Croffut, in the Buckeye Cook Book.*

Sealing in the Pacific.

THE islands in the Pacific immediately across the channel from San Francisco are more or less unknown, except to the few fishermen who visit them in the pursuit of their vocation, and a few words concerning them may perchance interest your readers in the East; for California, its valleys and mountains, its lakes and rivers, and its immense sea coast, with the adjacent islands, may be almost compared to Alladin's lamp—perpetually opening something new and interesting. If one should, on a clear day, take a glass, and from the best standpoint on the island of Santa Cruz (about 23 miles from the main land) scan the western horizon, he would see distinctly a group af small islands lying off in the ocean about eight or nine miles. It is with the smallest of these and the most southerly one, that we have to deal on the present occasion, it being the most visited islet of the group, and also the most interesting. It is called "Ancapapa Island," and is between six and seven miles in length, and very narrow in width, the greater portion being solid rock. Some of its rocky elevations can be almost called mountains (as they are perhaps 900 or 1,000 feet high), and these constitute the home of thousands of sea birds, like the Farallone group, where the gathering of eggs for the San Francisco market is a very extensive and profitable business. In all but one or two places the towering cliffs jut out into the ocean, and close in shore the water is many fathoms deep. The solitary exception to this precipitous barrier is a little sand-spit of about 100 feet long, where boats are generally landed, and where the seal fishers make their camp. It is well sheltered, and makes quite a cosy retreat, where the whispering of the winds and the music of the billows form the fisherman's lullaby, and where one could dream away tedious hours. On the south side of the island from shore to horizon lies one vast bed of seaweed, gently undulating in the swell of the ocean; but when the storms of wind sweep over the rugged sea-worn cliffs, the myriad broad leaves of the growing kelp lift themselves in the air, and with each succeeding gust strike the water with a sound as of musketry. There is no fresh water on this rocky isle, yet it is inhabited by sheep and goats whose only drink consists in the heavy dew falling on the grass at night.

The fishermen who come here must bring their wood and water with them. The seals are found here in great numbers, mostly of the black variety, though occasionally leopard seals are killed, and sometimes a sea lion or two. These of course are not the fine fur seal, but are killed for the blubber and large quantities of oil which they yield, and the Chinese give from 75 cents to $1 each for the long hairs which form the animal's mustache. The leopard seals seem to remain on the island but a short time, and do not breed there, the dams bringing forth their single pup in the water, the youngsters paddling off as naturally as possible. The black seals on the contrary bring forth their young on the rocks, and the pups never enter the water except on compulsion until three or four months old.

The females remain on the island the year round, while the males make annual excursions, always returning, however, at a stated period, which is generally about the first of June, when they are very fat; so much so that they carry ballast in the shape of smooth stones to overcome the floatative powers of the quantity of blubber with which they are encumbered. As much as fifteen pounds of these stones have been taken from the "false stomach" (provided by nature for the purpose) of a single seal. After remaining in and about the island just two months the bulls, poor in flesh from incessant combats among themselves, and with all the ballast thrown overboard, depart to recuperate, and remain away until the next year. About the first of April the bull calves also leave, doubtless to be out of the way before the arrival of the fierce old bulls. The full-grown bulls average about eight gallons of oil, worth in this market fifty cents a gallon. The half-grown pups yield a smaller quantity. Most of the seals are killed on the rocks, but when shot in the water the bullet must be almost instantly fatal, so that the animal's head drops; otherwise, if the nostrils remain above water the air is expelled and the body sinks. The old cows are never killed except by accident. The water around the island is full of fish of various kinds, and on a clear day, when the sea is calm, one can look over the side of a boat and watch the finny tribes, fathoms below, chasing each other around the mossy stones, or darting in and out among the many stranded cables of golded kelp.

While you are gazing upon this fairy scene below, one of those hungry monsters of the deep—a wide-awake, open-mouthed shark—will dash across the field of vision in the watery depths, and instantly there is a stampede among the fishes. Or perhaps the "shovel nose" will manfest a curiosity to see where you are going, in which case he loafs along at the stern of your boat, and the cold chills chase each other down your spine as you think how easily one could "shuffle off this mortal coil" by simply the capsizing of the frail cockle-shell in which he is sitting. There are many beautiful shells around the shore, but to gather the finest the searcher must strip, and in water up to his neck turn over the stones at the bottom, and pluck them from moss, sea weed and rubbish. When a stray crawfish or crab comes along and fastens upon his toes, and perhaps the one with a corn on it, the poetical emotion with which he was first actuated is apt to be quenched at once and forever. Perhaps the greatest peculiarity of Ancapapa Island is a vast and gloomy cavern of unknown depth, located in the middle of the highest mountain, at the level of the sea. This great cave has been explored with boats, and torches to a depth of some hundred feet, but found to be full of seals, and the cavern was believed to widen out and shelve up, so that there was danger of the seals floundering down off the rocks and striking the boats; and the superstitious old sailors comprising the exploring party refused to budge another inch into the inky blackness stretching out before them. Thus, while on the very threshold of an apparently extensive grotto, their ears ringing with the barking of the seals, reverberating through all the unexplored caverns beyond, like peal upon peal of thunder, and while the phosphorescent light underneath the boat marked the wake in every direction of a frightened seal, they returned to daylight without any further research. But it will undoubtedly be thoroughly explored before long, and all its hidden recesses and gloomy grandeur exposed to the adventurers who are above superstitous feats.

Tradition has it that it was formerly the haunt of the old pirates in the days of the Montezumas and the persecuted Incas, and if the old sea-kings were inclined to hide away any stolen treasures they could not have found a more secure spot. Just beyond the archway of the cave, which has undoubtedly been widened and made longer by the action of the waves of the sea, is the wreck of the old steamer Winfield Scott, stranded here on a dark and foggy night in 1855. The vessel struck a rock so near the shore that all her living freight were safely landed, and not a life lost. Divers, a short time afterwards, saved her treasure and most of her valuable machinery.

C. C. P.

San Francisco, Jan. 4th.

—Some recent experiments of Prof. Tyndall, in which hermetically sealed solutions in exhausted vessels gave birth to living germs with unexpected and disappointing readiness, nevertheless failed to convince the experimenter of spontaneous generation, and on repeating the trial in a changed atmosphere, and with new precautions, no life appeared. In a lecture before the Royal Institution, he named his experiments "a combat with an infected atmosphere."

For Forest and Stream.

A SNOW-SHOE TRAMP.

SOME of our most pleasant memories are from snow-shoe tramps in the neighborhood of this ancient city of Montreal, and we would like to interest readers of Forest and Stream in one of our many marches.

Some six or eight years back, three fast friends and myself, who had been accustomed to make short tramps in company to places around the city, determined to devote a few days of our Christmas time to a more extended tour. We decided to go across country to Cornwall, distant about seventy-five miles from Montreal, and started on the day appointed, equipped with large, serviceable snow-shoes, and blanket coats, and with well-filled knapsacks strapped to our backs. The only member of our party who deserves special mention, was a gentleman who had taken his B. A. at Yale, and was now studying medicine at McGill, and who went by the irreverent title of "Banty," a cognomen procured him by his short and stout, though active *corpus*, and his somewhat pugnacious disposition. Banty, with A——, L——, and myself, constituted the expedition.

The day we set out was a beautiful winter day, such as are common on this side of the line. The sun was shining brightly though coldly—trees, houses, everything, glittering in the light—and the crisp snow rustling beneath feet and sleigh-runners with that delightful sound so well known to all Canadians; the air, fresh and bracing, inspired new life at every step. We had intended to make Lachine our first stage, take dinner, and go on to Point Clair, there to stay all night, thus making about sixteen miles; but so beautiful was the day, and so heartily did we enjoy the tramp, that we unanimously resolved to go to St. Ann's, eight or ten miles farther, which we successfully accomplished. This day's tramp will ever remain fresh in my memory. The snow threw its spotless mantle over hill and dale, and overhead the cloudless expanse rivalled an Italian sky in its deep clear blue; on we trudged past hut and farm-house, the evening air setting our appetites on edge so keenly, that to this day I am doubtful whether our host that evening at St. Ann's did not send to warn the sole doctor of the village to be prepared for emergencies.

Next morning, however, we rose in good time, and after pitching into a hearty breakfast prepared to resume our tramp. Alas! no longer the sun cheered our frosty way, and quiet air enabled us to hold our heads up and view the beauties of a Canadian winter scene; the wind was howling over the plains, driving huge descending flakes before it with an energy that made us tremble in our shoes, or rather moccasins. In spite of the uninviting aspect of affairs, however, we started out, determined to do or die, but we were compelled to keep to the road, instead of going across country. Worse and worse grew the storm, dashing straight into our faces, and reducing our rate of progress to less than two miles an hour; little Banty, whose short legs had hitherto kept him in the rear, now manfully struggled forward, and assumed the lead with heroic spirit. For about three hours after leaving Vaudreuil we struggled on, and no sign appearing of a little village which we had made up our minds to stop at, an investigation was held, and we found ourselves, we did not know in what place exactly, but certainly where we had no business to be; we had lost the road. Without wasting time in *audible* curses upon Banty, we began to reconnoitre, and after a few minutes wandering sighted a farm-house through the storm, which welcome sight freshened our jaded limbs into a run. An old sore-footed French-Canadian came to the door in response to our knocking, and although at the first glimpse he half-closed it again, he was induced to parley, and received us with hearty hospitality when matters were explained.

It was about four o'clock, and the storm seemed to be increasing in violence, so after making sure that we would not inconvenience the inmates, we determined to stay all night, although it turned out that the road we had lost passed within a mile of the house. The unforeseen change from our settled plan was rather pleasant than otherwise, to us, but still we combined in a wordy attack upon Banty, which at length disturbed that gentleman's equanimity; one remarked, concerning the necessity of his staying where Nature meant him to be, *i. e.*, behind the others, on a tramp, nearly bringing on a personal encounter. The worthy farmer, however, came out with some news, which at once restored peace, no less than that there was to be a

wedding that evening at a neighboring house (two miles distant), and to which we would all be welcome did we choose to go. At first all of us proposed to attend, but as the hour drew nearer at which the farmer intended to start, two of our number backed out; the howling storm out-doors, and the warmth and comfort within, proving too much for their courage. Banty and myself held to our original intention, and tucking ourselves well in among the buffalo robes, went off, somewhat regretfully, I must own.

After a cold drive we reached our destination, and alighting went into the well-lighted farm-house. It was the first time I had ever been at such an affair, and I enjoyed it thoroughly. Of course this was merely the dance which was to close up the ceremonies in a fitting manner; the marriage, wedding, dinner, etc., had been all fixed up earlier in the day. There were some very pretty Canadian girls there, one of whom was my partner during most of the evening, and it was most amusing to listen to her rapid talk, although I rarely understood more than half of it. There was no supper, but I observed a certain black bottle changing hands quietly among some of the men; the active habitants danced away, seemingly without fatigue or desire for substantial refreshment until five o'clock in the morning; and although we knew we had hard work before us, and had been pretty well exercised during the storm, still we enjoyed the fun too well to leave before the party broke up.

We soon regained our quarters, and tumbled into bed, still resolved to rise at seven. Indeed the last thought I was conscious of, was that it showed great pluck in B. and myself to tramp all day, dance all night, and then tramp all next day with only a couple of hours' rest. Alas! poor human nature, "the spirit was willing," etc.; at the appointed time our *confreres* tried in vain to get up—even breakfast had no charms to equal those of our straw mattrass. We did not rise until mid-day, and then we found that S—— and L—— had gone off some time before, leaving word that they would wait for us at the Côteau du Lac. The day was clear and fine, but the quantity of snow that had fallen was immense, and as it lay in fleecy layers that gave way at the least touch, our predecessors must have had much difficulty in getting along. Their track was perfectly plain and distinct, and where one had had a fall, by no means an infrequent occurrence, the path was still plainer, though not perhaps so distinct. We were able to follow them with tolerable speed, for one of the beauties of snow-shoes is, that after one man has passed over the ground, his followers have a comparatively easy task; and when we arrived at Côteau du Lac, we found that they had reached it barely half an hour before, having taken twice our time to do the distance. After resting here the remainder of the day, we resumed our tramp by moonlight, stopping about ten o'clock at the house of a small farmer (an Englishman) known to one of our party.

Next day we resumed our tramp, and although it was thawing slightly, and therefore very disagreeable to the feet, which were soon soaking wet, we managed to make a good distance. The day after we walked into Cornwall, where we received a welcome, which, with the fun of the tramp, sent us home with recollections that are apt to break out now-a-days whenever we meet. HABITANT.

For Forest and Stream.

A DEER HUNT IN CALIFORNIA.

ON a cloudy morning, not many days ago, H. and I started out for a day's sport hunting deer. The weather was not very favorable, as it was near the change of seasons, when the nine month's dryness is succeeded by the life-giving rains, and the moisture charged air, and the green fields, indicate the season that we Californians call winter. Then the deer are leaving the mountains in order to find shelter.

After we left camp, our course led up a canyon which was overtopped by tremendous mountains. On arriving at a place where the canyon "forked," we decided to go up the hill between the canyons, but this was a way soon repented of, for we soon found ourselves in an all but impenetrable chapparal, the dense undergrowth that covers the mountains of California. Our passage now was not only tedious, but painful, as the brush and thorns were strong and huge rocks presented themselves at every step. At last, we emerged into an open plain, and were rejoiced to see three fine deer. Unfortunately they had the wind from us, and were on the lookout. The distance being over a thousand yards, it was neccessary to creep closer, and to keep hidden, we had to keep to windward of them. When we had approached near enough, we went in sight again with our guns in readiness, but those three deer didn't stay long, you can bet. The way they made themselves scarce was a caution. Then we turned our steps toward the higher lands, and soon arrived at the summit of the Coast Range, where we stopped to enjoy the prospect and the cool air. By way of diversion, we rolled some loose rocks down the mountain, which would sometimes roll for a distance of two or three miles before stopping, and it was not long before we saw three deer running among the live-oaks, with which that side of the mountain was covered. As they were at a great distance we decided to let them go and try a new direction. We had not gone far before we saw three more. We remarked on the fact that this was the third time we had seen three together, and remembering that "luck is in odd numbers," we approached within 200 yards, and each picking a deer, fired. H.'s deer started off with a broken leg, but my bullet overshot and the two that remained, stood for a moment in doubt as to which way to run. Their hesitation did not last long, and we were surprised to see them coming toward us, as fast as fear could drive them.

Now, had we been old cool-headed hunters, instead of the excitable boys we were, we should have waited until the deer came closer; but instead of this, we sprang up and began to shoot as fast as possible. H. was armed with a Smith & Wesson rifle, and I with a Winchester repeater. In five seconds the battle was over, and the victory was ours, that is we had driven the deer off the field. But alas! they had left no slain. I was certain of having killed one, but his dying efforts had taken him into that fearful chapparal, so we started in the direction that H.'s wounded deer had taken, and soon overtook it. But it had life enough yet to outrun us, and it had all the advantage of us now, for H.'s gun was not easily reloaded, and I had such an unmistakeable attack of "buck ague," that I forgot to work the finger-lever, and so snapped twice on an empty shell, under the impression that the main-spring had become weak. The deer soon left us, and vanished in the chapparal, so that it was utterly impossible to penetrate. Nothing larger than a rabbit ever does penetrate the thickest of these brakes, except a grizzly bear or a wounded deer. So we started for camp empty-handed, although with a dog and an ax, we could have got two of the three deer.

On our way back we got separated, and suddenly a buck sprang up, on the slope above me. In an instant I sent a ball through his chest, and before he had time to spring, I pulled the trigger again, striking him through the lungs just as he sprang. This ball entered behind his right shoulder and went out at his neck on the opposite side. With one bound he disappeared from my sight, and simultaneously with his disappearance, I heard H.'s gun. He struck the same deer in the lower jaw, and knocked him down. H. then ran in that direction, while I, ignorant of the effect of his shot, ran up the divide, just in time to see the deer rise and cross the hill, for H. had failed to find him. As he came in sight I fired my third shot, which went over his back and into a herd of mustangs. As I had no time to look after horse meat, I followed after the bloody trail before me, and soon saw our venison under a tree in great agony. I approached confidently to cut his throat, but he refused to let me do so, and started off in a slow walk. Mingled red and white froth dropped from his nostrils, and by the heaving of his flank I saw that he was dead on his feet. Just then H. came in sight and sent a leaden farewell at him that sent the splinters flying from his horns. This shock restored a moments life to him, but his gait was a stagger and he breathed out blood instead of air. I stepped up beside him and as I struck him with my knife, he gave one glance at his captor, a sob of indescribable anguish, a shudder, and submitted to his fate.

We passed in our verdict that he was plucky and started off to camp with him, and were tired enough when we got there. MELVIN SNOW.

Santa Barbara.

For Forest and Stream.

HABITS AND PECULIARITIES OF THE MOOSE.

THERE is probably no animal on this continent about which so little that is strictly true is publicly known, and so much that is false or absurd has been written, as the one whose name stands at the head of this article.

No stronger proof of the first assertion is needed than a glance at the two great lexicons to which Americans are accustomed to flee for information. Webster gives a cut of the European and American elk, with a description which leaves the reader to infer that the latter animal and the moose are identical; while Worcester has a representation of a nondescript animal, which is neither the one nor the other, with a description of the "elk" or "moose" extracted from the "British Cyclopedia" The "New American Cyclopedia" has a very full and correct description of the forms and appearance of the moose, but says: "a male, female and fawn usually yard together," and speaks of the animal as "tramping down the snow in its yard," both of which assertions are utterly at variance with the facts. Now as the utter extermination of the moose in this country is only a question of time, it is important that its habits should be thoroughly understood during its existence.

It is an extremely shy and solitary animal, making its haunt in the deepest recesses of the forest. The early writers evidently obtained their knowledge of it at second hand. One of them speaks of it as "invariably browsing backwards," and that it is hunted in the following manner:

"The hunter creeps on the track with the greatest caution till he discovers by the marks on the snow that he is very near it. He then breaks a twig, at which sound the moose starts up and prepares to flee, when the hunter fires and seldom fails to bring down his game."

Nothing more absurd could well be written. Fancy a moose browsing backwards in three feet of snow, with a stiff crust on the top! How can the hunter tell by the "marks on the snow" that he is very near it? and why is the animal invariably lying down at that particular moment? It is true that the experienced still hunter can tell about how long a time has elapsed since the passage of the animal by drawing his finger across the "drag" made in the snow when withdrawing its feet, except when the snow and air are at the same temperature, when this sign fails; but even when in force it cannot be depended on as indicating the proximity of the animal, as it may have been lying down for hours, or, on the contrary, it may have been startled by some unusual sound in the forest, at a point just beyond that to which the hunter has arrived, and be already miles away, when the hunter supposes it to be within gunshot.

Strolling up California street the other evening I caught sight, through an opposite window in the second story of a building, just occupied by a traveling museum, of the antlers of the noble game under consideration, and paying my "two bits" passed up the stairs and found myself in the presence of a stuffed specimen of a "bull moose" about four years old, suspended from whose neck was a placard bearing the following remarkable legend! *Swiftest animal on earth; has been known to trot 17 miles an hour for 24 hours; never known to gallop.* To give color to this extraordinary assertion the taxidermist, in mounting the skin, had stretched it to nearly twice its normal length, with a corresponding diminution in size, and had drawn its hind legs backward till it bore about the same relation to the living animal that a thoroughbred greyhound does to an English bull dog. By dint of questioning, the fact was elicited that the animal was shot somewhere on the Columbia river a little more than a year ago. There was no appearance of any "bell" hanging from the throat, and a close inspection failed to discover any signs of its having been cut off; but it is hardly probable that the animal differs so essentially from its congener of the Atlantic slope. But the false ideas conveyed by that ridiculous placard will be carried away, and be rehearsed by the readers to children and "children's children."

The moose is not a remarkable swift animal. The writer once saw a freshly started one strike out on to an open bay over a mile in extent, where the footing was perfect, he just sinking enough to steady his feet. He was pursued by two dogs of ordinary speed, who not only found no difficulty in keeping up with him, but would repeatedly dart across in the vain endeavor to sieze upon his heels, losing thereby several rods of ground, which they easily regained.

That for which the animal is remarkable is his long continued powers of endurance, and his apparent indifference to, and ability to overcome, any natural obstruction in his native wilds. He not only surmounts with ease, and with out breaking his trot, windfalls over six feet in height, but he also passes over with impunity the most treacherous and bottomless morrassee. Indeed, half his existence in the summer season, when undisturbed, is passed in the latter, feeding on the stalks and roots of the yellow water lily, which is above all his favorite food.

Almost all writers speak of his tramping down the snow in his yard, and many write of the hard-beaten paths made by the animals in going and returning to their yards, as if they left them in the morning and returned at night like cattle to a corral. The size of the yarding ground is regulated wholly and solely by two considerations—the depth and hardness of the snow, and the facilities for browsing. When the snow is shallow and soft they will wander forward for miles, hardly ever straight forward, but "beating back and forth over more or less width of ground, usually on each side of a brook of open mountain water. When the snow becomes very deep, or a sharp crust is formed on the top of it, their field of operation is correspondingly restricted. They will then retrace their steps carefully, walking in the paths already made, and eating the coarsest food they daintily rejected when travel was unimpeded. Sometimes, when the fearful northern snows come down in depths of six feet, and the sun of March forms a crust on which a man can travel without often breaking through, it is almost impossible for them to move sufficiently to avoid starvation. They will then eat every green thing as high as they can reach, and which is not more than an inch in diameter, and such places where they are thus "snowed up" can be told at a glance by the experienced hunter for years afterward. The two sexes never yard together of their own volition. Sometimes a male will be chased into a yard of females or *vice versa*, and its track be lost by mingling with those that cross and recross it in every direction. Then, if the snow is deep or the crust sharp, it will remain there, always, however, choosing a part abandoned by its former occupants, and which they thereafter always carefully avoid. To such an extent is the avoidance of the sexes carried during the winter season that the young male invariably separates from his mother the second fall (when 18 months old), and sometimes even the first, as the writer has found them in yards with older males when less than a year old. The females, on the contrary, remain with their dams two and three years. So that it is not unusual to find the mother, her first, second and third offspring, and one of her eldest in the same yard. This is the extent of their breeding together. My observations teach me that they are less gregarious than any other variety of the Cervidæ.

The first young is dropped at two years of age, only one the first birth and often the second; after that two, and I believe always of opposite sexes—at least I have never seen an exception, and the same is true of the common deer. When three are dropped at a birth they are usually, if not always, two females and a male; one of the females is undoubtedly incapable of reproduction, as in no other way can the presence of "barren does" be reasonably accounted for. They bear about the same proportion to the whole numbers as do the number of triple births. They appear to be perfect animals in all their parts, are somewhat stouter and more compactly built than their fruitful companions, and all invariably loaded down with fat in August, when those having fawns are quite lean. I am speaking now of deer, as my opportunities for observing them have been so much greater, but it applies equally to

moose, so far as I have been able to judge. But to return to our mutton (or venison).

The food of the moose in summer consists of the various tender grasses and plants springing up on the low bottoms and banks of streams, and the lily mentioned above. In winter it is governed wholly by the temperature. In the coldest weather they retire to the almost impenetrable thickets, and subsist solely on the fine boughs of the evergreens—fir, cedar and hemlock—the first being decidedly their favorite, while the cedar is greatly preferred by deer. This taste for the evergreens is a wise provision designed by Providence for their preservation, as the heat generated by fermentation in their stomachs is undoubtedly what enables them to withstand the effects of the intense cold. When the weather softens they immediately leave their coverts and repair to the sides of the ridges and upland water courses, where they subsist exclusively on "hardwood browse—that is, the twigs of deciduous trees, the "moosewood" and "whitewood" (two varieties of the maple) being their favorites. The mode of browsing by the males is so radically different from that of the females that an old hunter can tell at once, on finding a yard, which sex inhabits it, even if the tracks are obliterated.

The bulls will approach a tree three inches in circumference, and seizing it as high up as they can reach with their prehensile upper lip and sharp under teeth, will force it downwards until they can get their fore leg over it, when they will commence browsing off it, standing astride it, and gradually working their way to the top, which having devoured at their leisure they will leave it to spring back, looking as though a hurricane had passed over it. It is held by the majority of intelligent hunters that a bull moose never gnaws the bark of a tree, in which belief I fully concur. In all cases coming under my observation, where it was claimed they had done so, it was evidently done by cows before the yarding season. They are much more delicate feeders than the males, never pulling down the trees, and contenting themselves with the finest of the browse, and gnawing the bark off the standing poplars and maples on one side, but rarely or never going round it, so that it is seldom killed, but slowly grows over, showing the marks for years; and there are townships in my native State where one can travel the day through and scarcely be out of sight of trees thus mutilated twenty years ago. These noble animals fairly swarmed in all upper portions of the State.

Their destruction is a matter of history. Space and time are both too valuable for the discussion of such an unprofitable subject. The being with the skin and clothes of a white man, who in one winter butchered seventy-five of them for their hides alone, leaving their meat to pollute the air, still flourishes on the upper waters of the Passadumkeag, and a few months ago, after bringing a party of nine sportsmen with twelve or fifteen dogs from Rhode Island, who were obliged to go back in a hurry to avoid prosecution, he came out with a communication in a leading State paper deprecating the law which forbids deer hunting with dogs, on the ground that sportsmen left twenty dollars in the State for every deer they took out! His memory deserves to be execrated more than him who burned the celebrated temple of antiquity, for destroyed temples can be rebuilt, but exterminated species cannot be recreated.

San Francisco, Jan. 23d, 1877. PENOBSCOT.

For Forest and Stream.

A DAY'S FISHING OFF NANTUCKET.

SEVEN o'clock was the hour agreed upon for getting under way, but it was sharp eight before all the party of five arrived on board the snug little schooner yacht that was to take us to the fishing grounds. The wind that had freshened at daylight almost to a gale, had now died away to a wholesail breeze from the south and east, and we ran out of the dock under our foresail, hoisting mainsail and jib off Bunt Point, and stood for Great Point Light with the wind abeam. The white-caps across the bar showed that rough water lay outside, but our course, protected by Coatue Point, was quiet as a mill pond.

We were in charge of two thorough fishermen, "Alex" and his brother "Loring," the former a coast pilot and wrecker of considerable notoriety, and while he acted as pilot his brother got the lines ready for use for the bluefish we expected to catch. The only singular thing about these lines relates to the "drails" which are attached to them; they being made by running a half pound of lead, or more, around the shank of any large sized hook, in the form of a cone; at the upper end a loop of wire is introduced to hold the line, and the lower end tapers until it meets the shank opposite the point of the hook, when attached to the line a pickled eel skin is drawn over it until the lower end just covers the head.

As soon as we had crossed the bar and its adjacent shoals and struck deep water, we let out the lines and soon were hauling in the blue beauties, hand over hand, and as we all had handled a drail before, it was not long before the tubs began to fill. As the fish were hauled on board their throats were cut by Loring and the blood carefully saved for after uses. Well, we caught nearly one hundred averaging nearly five pounds, and satisfying all hands (literally, for several fingers were cut to the bone hauling them, notwithstanding the stalls) and then lay to under the lee of the point, took a bite and washed it down, and then stood away for the shark ground, where we made everything snug, and gave the yacht cable enough to ride easy, for by this time she was kicking spitefully. The shark hooks (1-inch steel, 2 feet shank, and 6 inches across the bend, and attached to a fathom of iron chain) were got out and baited with bluefish, and the "shore end" of the lines made fast to belaying pins; in the meantime Alex was slowly pouring the blood and bloody water overboard, where it ran down with the tide, which was rapidly ebbing. When all preliminaries were arranged we lighted our pipes and waited until the sharks should follow the blood up to the boat. We did not wait long before a tug on one of the lines told us they were around. Pipes were dropped, and as the line straightened under another pull, we *surged* on it, and his sharkship was hooked. Slowly, hand over hand, we hauled him up, and as he neared the surface Alex seized an immense East Indian war club that he carries for the purpose, jumped over the wash board with it poised, awaiting his appearance. A moment more and the water began to boil in great bubbles. We caught the gleam of a white surface under the boat and then with a gutteral roar, the body of a twelve foot shark rolled up beside us. He had rolled himself up in the chain and was biting it savagely, conclusively showing why it was used, and as he reached the surface made directly for the boat, leaving several of his round white teeth in its sides. We took in the slack and soon had his head alongside, when a few lusty blows on the nose from Alex stiffened him, and then hauled him aboard. We continued fishing until the sun was low, and then hoisted anchor and tacked for Nantucket.

The sand, or dusky shark, is the most common in New England waters, he attains a length of from nine to twelve feet, and lies entirely on the bottom, never so far as I can ascertain rising to the surface to feed; their color is a sandy yellow beneath, and dirty brown back and sides, are sluggish biters and lazy when hooked.

The blue dog, or man eater, which I have also caught here, differ essentially from the above, he is rarely so long, is slimmer built, his back a bluish color, whence his name, and his belly yellowish white. He is often on the surface, swimming in short tacks, his sickle shaped dorsal, cutting the water like a knife. He takes bait greedily and is off, and your hands full until he lies dead beside your boat, or as is quite frequently the case, escapes by shaking out the hook in one of his *breaches* out of water. The river shark is a smaller, though even livelier addition of the blue dog, seldom reaching a greater length than six feet.

The most striking difference between the sand shark and blue dog exists in the formation of the teeth, those of the former being round, sharp, and curved slightly inward. The latter are triangular in form with serrated edges; either are perhaps an inch long, and lie in several rows, one behind the other, the front one only being erect; those in the rear bending backward at an angle of perhaps 20° from the jaw. When a tooth in the front rank is broken out, which is constantly occurring, the one next in file moves up and takes its place, and so on through all the rows until the last, when a new one starts its growth.

The only vulnerable part of a shark seems to be his nose, a few blows on its edge soon quiets him, while a pile-driver directed against his head would not kill him, and shots from a revolver only makes him the livelier. I have heard whalemen say they had often seen them swimming around a whale, moored alongside and being cut in, with their entrails hanging out of a gash made by a cutting in spade; and I will go further and relate an incident confided to me by an old salt, who I am afraid imperilled his future existence by telling it, that he had seen them with their entrails entirely out, swallowing pieces of blubber which came out through the wound, and which were in turn swallowed by the sharks behind. Of course all readers of the FOREST AND STREAM have heard of their swallowing red-hot shot thrown to them from a vessel's deck, which immediately *fried* their way through, much to the astonishment of the swallower, in fact so far as that is concerned a shark will take anything from a log of wood to a man's leg.

Don't drop a dead shark on the grounds, if you do you will hardly get another there for some time to come, for while bold in all other particulars they are wary and suspicious in this. When once ashore his liver is taken out and "sun-tried" of its oil. The jaws, if large, are cleaned and sold to visitors by the boatmen, and the carcass used for manure. The hide was formerly used as a covering material for certain articles and for sand paper. But after all, when the novelty is once worn off, sharking has less of sport than of butchery about it, and hasn't enough danger about it to be exciting. VERD MONT.

For Forest and Stream.

CHICKENS IN MINNESOTA.

ON September 4th we found ourselves at a small station on the Southern Minnesota R. R. ready for either chickens or ducks. With a good night's rest after the weariness of our three days' ride from the east and a hearty breakfast in the morning, we were ready. The wagon was at the door, so with dogs and guns we were off for the prairies. The weather was not of the best. Rainy nights made the grass wet, and slow was the sport at first, but soon the sun dried up the moisture, and the dogs went down to work. Stop! A point on the left, and out jumped my friend. Two birds fell to his gun and one only to mine (killed from the wagon, for I was not as quick to get out). The birds rose slowly, and when we gathered them up nine of eleven in the covey were brought to bag.

On again over the next dip of the prairie, when a covey flushed by the wagon left two of their number behind them, killed from the wagon. The flight was a short one, so we walked to them, leaving one dog on a point some distance in an opposite direction. We quickly got to work, bagging five this time, two falling to one barrel, the rest of the flock going off together. Turning to look for the other dog we found him still standing like a rock, but looking backwards towards us evidently waiting for us. The birds waited also, for before we left them we bagged six. A single bird, killed as we drove to another depression, and a flush by the dogs of a fine covey occupied the morning hours.

Giving our horses and dogs a good hour for rest and investigating a basket provided by our kind hostess in the mean time, we smoked a pipe of "Ilyco." "Vanity Fair" is good, but we preferred the former; then up and off for the afternoon.

It seemed as if all the birds had emigrated. Not one covey could we find. Something was wrong. At last a point was made in a slough, a low, marshy place of perhaps ten acres, with grass to the waist. In we went, uncle deep in the water. Whew! wasn't it warm in there for a few minutes! The place seemed alive with chickens. Shall I confess it? We lost our count of birds hit, and could not tell whether we gathered all or not. Awfull I know it, but I guess we had the chicken ague. I omitted to mention that we found these birds near dark. Could the hawks, which were very numerous, have driven them into this thick cover? We never found any more in a similar place.

The "hoppers" were plentiful, and respecting the farmers' wishes we limited our bags to twenty-five birds. I must except one day from being a success. Birds were plenty, the dogs worked well, and our driver in good humor, but kill we could not. Out of at least fifty shots that day only twenty-one were bagged. Point after point, and covey after covey; bang, fizz, whizz, whirr! and away all would go. Occasionally one crippled, and then to be hunted up by the dogs. At last, thoroughly out of humor, we gave it up and went home, being heartily laughed at by our driver, who seemed to enjoy our discomfiture much more than our success.

There was no drawback during the entire trip, and at the end of our two weeks we could only leave our dearly loved friends by promising to return next fall. I know this is a long story, so I shan't feel a bit badly if you toss it into the waste basket. RIN ROS.

Fish Culture.

THE AMERICAN FISH CULTURIST'S ASSOCIATION.

THE sixth annual meeting of the American Fish Culturist's Association was held on Wednesday and Thursday of last week. Never was one held under more favorable circumstances. Through the kindness of Messrs. Coup and Riche Bros. the spacious reading-room and library of the Aquarium was placed at the disposal of the association, and certainly no more appropriate or convenient place for meeting could have been found. Although the attendance was perhaps not so large as on some previous occasions, yet the number of practical and scientific fish culturists present was something unusual. Hon. Robert B. Roosevelt, the President, occupied the chair. Among the members present were Prof. Spencer F. Baird, of Washington, Secretary of the Smithsonian Institution and United States Fish Commissioner; Prof. J. W. Milner, of the Smithsonian Institution; Mr. Samuel Wilmot, of the Fish Commission of Canada; Mr. William M. Hudson, of the Fish Commission of Connecticut; Mr. T. B. Ferguson, of the Fish Commission of Maryland; Mr. M. Walneim, of the Fish Commission of Norway; Mr. Livingston Stone, of California; Mr. Seth Green, Superintendent of the New York State Hatching-house; Mr. Charles B. Evarts, of Vermont; Mr. B. B. Porter, of New Jersey; Mr. C. J. Battemanne, Superintendent of the fisheries in Holland; Mr. Chas. Hallock; Mr. W. M. Tileston and Mr. J. J. Van Wyck, of New York; Mr. B. B. Phillips, of Brooklyn; Mr. F. Mather, of New York, and Mr. M. C. Edmunds, Secretary, and E. G. Blackford, Treasurer of the association.

THE FIRST DAY'S SESSION.

The meeting was called to order by the President, who read an interesting paper on the progress of fish culture in this State. As Mr. Roosevelt's paper will be embodied in the annual report of the Fish Commissioners of the State of New York we present only a brief abstract herewith:—

"The artificial propagation of shad was begun in 1869, and 15,000,000 were hatched. The work has been vigorously prosecuted ever since, and, including last year's operations, a total of 49,880,000 young shad had been placed in New York waters. The first experiment with salmon trout was successfully made in 1870, and has been annually continued. A total number of 5,947,000 fry and 456 boxes of eggs have been distributed. In 1868 the culture of white-fish was begun, and to the present date 1,758,000 fry and 26 boxes of eggs have been given out. The culture of salmon was commenced in 1871 with eggs obtained from Canada. The work has met with no very encouraging demand from the public for a supply of the young; about 210,000 only having been distributed annually. The California salmon was introduced into the waters of New York in 1873, and a total of 630,000 have been given out. Blue-backed trout eggs were brought from Maine in 1874, but the attempt to introduce them was unsuccessful. Some little attention had been devoted to eels, but more to their protection than to their propagation. In 1874, 36,000 of them were placed in Buffalo creek, above Niagara Falls, to see what would be the result of introducing them into Lake Erie. Experiments with sturgeon were begun four years ago, but without success. In 1875 they were repeated with great success, and about 100,000 young fish were turned into the Hudson. The hatching of brook trout was commenced in 1875, and 1,220,000 young fry and 24 boxes of eggs have been distributed since that date.

Importations of the eggs of the California brook trout had also been received, but out of 1,800 only 260 hatched out."

Mr. Roosevelt also spoke of the great change that had taken place in the condition of the shad fisheries of the Hudson, and said that in consequence of the results of the labors of the Commission there were now ten fishermen employed where seven or eight years ago there was only one. He also alluded to the difficulties under which the Commission labored for want of proper legislation, and cited the instances of Owasco Lake, which, after being stocked with salmon trout, was being rapidly depleted by spearing, a fact which was recently commented upon at length in this journal.

Professor J. W. Milner of the Smithsonian Institution being called upon read a paper on the protection of fish by legislation, recounting from the essays of Carl Peyer, of Austria, Bouchon Bradley, of France, and Theodore Lowda Kevies, of Vienna, the efforts since the middle ages to preserve the fisheries by legislative enactment. The continual amendment, repeal and re-enactment indicated an inadequacy in this means. Switzerland and England in the last decade were the only countries of Europe which gave encouraging tidings. In the United States the history of the laws was similar. Canada, however, by the enforcement of stringent laws and artificial propagation, had accomplished much. Mr. Milner also gave a general analysis of the legal enactments relating to fisheries, and the Canadian system was dwelt upon at length. This, however, he considered impracticable in the United States because of the large extent of waters to be protected. The necessities advocated were an awakening of public sentiment, and penalties upon officers who fail to enforce the law.

Mr. J. C. Bottemanne, Superintendent of the Fisheries of Holland, then spoke of the laws of his country for the preservation of fish, and said that in Holland there was a regular fishery police; and recommended the appointment of a similar force in America. Mr. W. C. Coup was then elected an honorary member of the association.

After a short recess Mr. Samuel Wilmot, of Canada, who exhibited a splendid specimen of the *Salmo Wilmotti*, or salmon, that had had access only to fresh water, delivered an interesting address on the progress of fish culture in Canada. In alluding to the specimen exhibited he called attention to the fact that it weighed, when caught, 17 pounds, and was discovered by means of holes punched in the dorsal fin and tail, to have entered in two previous years the small stream emptying into Lake Ontario, in which in 1865 he had placed the first salmon fry it had ever contained. Last autumn they had entered by thousands, varying in weight from five to 20 pounds, although the stream was so shallow that last year his men had actually to clear out the channel with rakes and hoes to allow the larger ones to pass. He stated that fish culture in the Dominion had been begun by himself in 1865 as a private enterprise. The Government heard of it in 1866 and 1867, and had determined to take hold of it themselves, considering that it could not be properly carried on as a private enterprise. There were now in Canada six large fish-breeding establishments, and there were at present 6,000,000 salmon and 9,000,000 of white-fish almost ready to be placed at liberty in the streams. In alluding to the subject of legislation Mr. Wilmot drew a comparison between this country with its fifty million of inhabitants and the Dominion with three millions.

The editor of this paper having sent for the inspection of the association several specimens of *Salmo fontinalis* and also the *Salmo canadensis*, all taken in salt water, a discussion arose as to whether the latter fish was not identical with the brook trout. Mr. Wilmot and Mr. Seth Green thought that they were. Prof. Milner thought that a more careful examination of different specimens would be required before the question was definitely decided.

Referring to the matter of legislation Mr. E. G. Blackford, of New York, thought that the present stringent laws with regard to having trout in possession out of season should be so modified as to protect the honest dealer from infractions which might arise through causes entirely beyond his control.

Mr. Wilmot having stated that the credit of having introduced California salmon to Eastern waters was due to Prof. Spencer F. Baird, that gentleman disclaimed the honor and stated that it was due entirely to the association. Prof. Baird also gave an outline of the formation and labors of the United States Fish Commission and spoke at some length of the proposed introduction of tench and carp into this country from Europe.

Mr. Milner then gave a history of shad culture in the United States, under the auspices of the United States Fish Commission, and said that it had been conclusively proved that Eastern shad fry that had been placed in the Sacramento river, in California, had grown and flourished and that he hoped in time to hear that they would increase to such an extent as to prove valuable as food for the inhabitants of that State.

Mr. Livingston Stone also spoke of the success of the shad culture in the Sacramento river, and then gave a history of the exportation of the eggs of the California salmon, which was becoming more and more successful every year. Up to date there had been brought a total of 25,000,000 eggs, which had cost about $1 per thousand in gold. A new feature in regard to the California salmon eggs was their exportation to New Zealand, to which island about 400,000 of them had been successfully carried during the past year. (A full account of the successful transportation of these eggs has recently been printed in this journal).

Messrs. Green, Tileston and Evarts having been appointed a Committee on Nomination reported the following officers, who were duly elected: President, Hon. Robert B. Roosevelt; Vice-President, George Shepard Page; Treasurer, Eugene G. Blackford; Secretary, B. Phillips; Executive Committee, H. J. Reeder, Easton, Pa.; Fred Mather, New York; Alexander Kent, Baltimore; W. F. Whitcher, Ottawa, Canada; Seth Green, Rochester, New York.

In the evening the members of the association were entertained by Messrs. Coup and Reiche Bros. at an elegant dinner given at the Gilsey House.

SECOND DAY.

The first paper read was by Fred Mather, giving an account of the operations in fish culture conducted under his supervision at the Aquarium. As this, with other papers read, will be printed by us in full we will only allude to them here.

Mr. Wilmot gave an account of his method of impregnating salmon eggs, and was followed by Mr. B. Phillips, who read a paper on the "Waste of Fish." In his remarks, Mr. Phillips called the attention of the association to the large number of different kinds of fish which the people of this country refused to eat, either through prejudice or ignorance. Mr. Frederick M. Wallem, of the Fish Commission of Norway, was the next speaker. Mr. Hallock being present on this day the discussion over the specimens of sea trout was resumed, Messrs. Hallock, Wilmot, Evarts, Roosevelt and others participating. The prevailing opinion was that the sea trout and brook trout were identical, the former being brook trout which had sought salt water from choice. The question will be decided, however, when a careful examination shall have been made of both fish and the question of species determined.

On motion of Mr. Phillips, Sukezawa Akekio, Imperial Fish Commissioner of Japan at the Centennial, was made an honorary member. In accordance with a resolution introduced by Mr. Milner, the work of the association was divided into four sections, each with a committee of three, and each section to be assigned subjects for essays to be read and discussed at the next meeting. Following are the sections, with the names of the gentlemen appointed:—

First—Methods of Fish Culture—Messrs. Green, Porter and Wilmot.

Second—Apparatus, Fishing-dams and Fishways—Messrs. Evarts, Stone and Ferguson.

Third—Natural History and Aquaria—Messrs. Milner, Mather and Hallock.

Fourth—Fisheries—Messrs. Blackford, Phillips and Edmunds.

Mr. Charles Hallock then offered a resolution, which was adopted, to the effect that in future the annual meetings of the association be held in the Aquarium, as it was the most suitable place that could be found for the purpose. It was further resolved that the Aquarium be recommended to the public as well worthy of its patronage. The meeting was then adjourned to meet on the second Wednesday of February, 1878.

BARNUM NOT TO BE HUMBUGGED.—Mr. B. strolled into the aquarium and admired, as he passed the tank in which the Kingiyo gently waves his superfluous tail and dreams of the little grotto fish pond, where in the far off land of the Kamis he with many of his kindred sported in days gone by. He paused and closed one eye, thrust his tongue in his cheek and severely chuckled, at the *to him* transparent humbug.

"Pretty well done!" he remarked. "A beautiful case."

"What's that, Mr. Barnum?" said Mather.

"Why, that fish—that tail is well put on. I call that a first-class job."

"Do you think that's an artificial arrangement, Mr. B?"

"Of *course* it is. You know how they make horned rats by insertiug the cut end of the tail in a cut on the nose; then trimming it off after it has healed in. Same thing, sir! same thing."

Mather was naturally somewhat abashed. The idea of his being associated in any manner with a humbug or fraud was not pleasant, and that the fraud should be in connection with a fish was touching him in a tender point; but here is a keen reason, and not to be shelved at the first onset.

Mr. Barnum," he quietly said, "if you will answer me one question, I'll own up that the Kingiyo is a humbug."

"All right. What is it?"

"Simply this: "*If that tail didn't grow* on that fish, *where* did it grow?"

Mr. B. passed on, and played with the pensive "Baby."

ON DIT.

AN AQUARIUM IN BOSTON.—We have already noticed the movement to establish an Aquaria in Philadelphia and Brooklyn, and now Boston has become interested in a similar enterprise. Last week Mr. Emerson Baker, delivered a lecture on Aquaria before the Massachusetts Anglers' Association, in which he suggested a plan for an aquarial garden on a large scale, with a zoological department attached, to be located on city land taken for the proposed system of public parks. A Committee of five was appointed to take this into consideration and report some feasible plan of action.

In describing the uses and construction of Aquaria he said:—

"The idea had frequently occurred to naturalists that fish life in its native element might be examined by explorations with the submarine armor; but the invention of the aquarium a quarter of a century ago enabled us to prosecute this examination in a much more thorough and agreeable manner. The first thing to be considered was the best material for the frame work of these structures. They were first made of iron; but this is subject to rapid oxydization, which necessitates painting, and nearly all paints are poisonous to fish. Slate is a very good material, but soap-stone is probably the best, as it neither expands nor contracts, and requires no coating of paint. The cement must be selected with care, and must contain no lime nor lead. But the all-important point to be secured is the aeration of the water in the tank. This must be accomplished either by forcing the air down into the water or by forcing the water up into the air, in either case by artificial means. Recently practical scientists have hit upon an excellent method of mingling vegetable and animal life in the aquarium, which enures to the advantage of both by maintaining a system of balance and compensation. The plants evolve oxygen and absorb carbon, while the fish give out carbon and inhale oxygen, thus establishing a mutually beneficial exchange of vital elements. Standing water is injurious to drink and catches all the atmospheric poisons. The water plant also imbibes noxious odors, and were it not for the intervention of the snail, which is the scavenger of the aquarium and a useful member of the fish society, eating up impurities and decayed particles, the former would cease its supply of oxygen. The remainder of the lecture was devoted to a consideration of the best and most economical methods of obtaining free circulation and aeration of water used for aquariums."

PROGRESS IN FISH FARMING.

EDITOR FOREST AND STREAM:—

It is simple justice to say that FOREST AND STREAM, has done more than any, and I might truthfully say, all other journals, to awaken and concentrate a spirit of inquiry on the subject of fish culture, and to disseminate the discoveries and improvements which within the last few years have been made in this important department of science. The files of your paper constitute an invaluable repository of information on all branches of inquiry concerning the preservation and propagation of fish, and the result is already apparent, not only in the increased interest manifested throughout the country, in stocking our depleted lakes and rivers, but in creating an extended interest among farmers in the construction of private ponds for raising edible fish. It is on this point that I desire to draw out practical suggestions for the benefit of those who are experimenting in that direction. It would be very interesting to have the experience of those who have constructed ponds for the purpose of supplying their own tables, as well as of those who have made larger investments with a view of raising fish for market. Let them give brief reports of the size of ponds, character of the water-supply, whether from spring, running stream, or natural lake,) manner of guarding against freshets; protecting young fish, general cost of constructing and stocking; kind of fish raised; the food supplied; quantity and size of fish, from year to year, and the general success or failure of various experiments made. There is a valuable fund of practical knowledge of these details which it seems to me might most profitably supplement the efforts of those who have labored so successfully to familiarize the public with the scientific details of fish culture. It has been claimed that an acre of water can be made to produce a larger revenue than an acre of land; and the success which has attended the various hatching enterprises, whose operations have been reported in your columns, may be considered as demonstrating the great importance of fish culture as a means of supplying cheap and healthful food for all classes of our population. Every farmer should have a fish-pond, not only as a source of healthful and interesting recreation, but as a matter of economy in supplying food for his family. It is to encourage farmers to avail themselves of the advantages which recent scientific inquiry has placed within their reach, that I have intruded upon your space. There are hundreds of your readers who can furnish short reports of the result of their experiments, which cannot fail to be of interest and value.

PISCATOR.

PISICULTURE AT MORSEMERE.—Morsemere presents more the appearance of a morsemer at the present time, since between the butts at the five hundred yard range and the targets there is a large lake about one hundred yards in circumference, and quite deep. This lake has been placed here for the culture of trout and will soon be stocked. Close at hand Mr. Morse has erected a small house in which the trout eggs are being hatched out. A large spring supplies the house with water and it is conveyed through pipes to the top of the buildings whence it passes through several filters to distributing pipes. The eggs, which are about the size of small peas, are placed on glass trays which fit in oblong pans, of which there are about a dozen, ranged on shelves each lower one projecting a little beyond the upper like a flight of stairs. The water enters the pans on the top row which overflow into those next below and so on to the bottom, each pan constantly receiving a fresh supply of water. After the fish are hatched they are transferred to larger square tanks in which the water is about six inches in depth, and the bottom covered with small white pebbles and shells. The water in these is also kept in motion, the overflow passing out of the building. There are in these tanks about five thousand tiny trout, a little over an inch in length, which gambol and sport about among the pebbles in a lively manner. It is interesting to watch the manœuvres of the younger ones in their efforts to swim. They first float on their side, then on their back, and making a desperate effort right themselves and proceed a short distance in quite good style. Last Saturday there were in the tank two pair of twin trout, they being joined near the tail, but it is seldom these curiosities live. The temperature of the water is kept as nearly uniform as possible, and there is a thermometer in one of the tanks, another on the wall, and another outside the building, from which Mr. Morse takes the temperature daily, and enters them on a tablet hanging on the wall. In the center of the room is a large stove, with which, in cold weather, he keeps up a proper temperature. At one side of this little house is a small reservoir about eight by four feet in dimensions, and quite deep, which will receive the trout as soon they get too large for their indoor quarters preparatory to their introduction to the lake, their final place of abode. It would repay one interested in such matters, to visit this place and watch the miniature piscatorial tribe for even a few minutes. —*Yonkers Gazette*.

CANNED SALMON.—Since communication with the Columbia river, the greatest salmon stream in the world, has been made easy of access by rail-road, there has been a great increase in the canning establishments on its margin, the annual catch being enormous; but it is already predicted that unless stringent laws are enacted regulating the fishing, before many years the number will be seriously diminished and eventually exterminated.

The salmon before canning, is boiled in oil and thus retains its flavor much better than when put up in vinegar and spices. It is, prepared in this manner, a very palatable article of food and retails at three dollars per dozen cans. The consumption is rapidly increasing in this country and a large quantity is annually sent to England. Previous to the present year the packing business of 1874 was the largest ever accomplished, aggregating 325,000 cases, being about double that of any previous year. When preparations for the present season began, packers estimated that 400,000 cases would be needed, but the bare state of the market in England, and the rapid increase in the consumption there, brought the large English houses into the field, and almost before the packing was commenced, 325,000 cases were sold by contract. Packers consequently increased their preparations, and with the expected large run of fish were prepared to work day and night, hoping thus to furnish 500,000 cases. However, on account of the cold water and swollen condition of the river, the fish ran low as a general thing, below the depth of the nets, and the result was a catch sufficient for but 410,000 cases. Of these, shipments have been made to England, direct from Oregon, of about 150,000 cases. In 1875 the consumption in that

country was over 200,000 cases, or double that of the previous year, and the same ratio of increase is being kept up, leaving altogether apparently only about 60,000 cases for the present twelve months' consumption, which last year exceeded 100,000. This would indicate that the price of canned salmon will advanced, and comparatively reduced sales will be the consequence.

—The steamer Zealandia, which sailed from San Francisco for Australia and New Zealand February 5, took out 180,000 white-fish eggs from Lake Michigan for the latter colony. Trout eggs from Charlestown, New Hampshire, were also fowarded, together with Californin deer and 27 short-tailed grouse from Utah, and by the next steamer prairie chickens, Oregon grouse and pheasants will follow.

Natural History.

GOLDEN PHEASANTS.—A correspondent who has paid much attention to breeding golden pheasants in this country encourages their propagation when he states that they will thrive in this country with good treatment and become quite tame. He says:—

"I have an old hen nine years old that never had a mate. It was brought to Wisconsin by an English sportsman named Poole. She knocks around with my common fowls—only she will be boss over the yard, cocks and all. She ranges wide for food, bugs and worms constituting four-fifths of it; but she comes home every night. I can raise them in domestication, and will turn a few loose and watch the results, provided the experiment don't cost too much."

—We have received from Hartford, Conn., *Wade's Weekly Exchange and Mart*, an advertising sheet to accompany the *Fancier's Journal*. It contains a large number of advertisements relative to fancy breeds of poultry, pigeons, etc., and must prove a valuable medium to those dealing in fancy fowls.

Forty numbers will complete the year, making, with twelve of the *Fancier's Journal*, fifty-two numbers. Single copies per annum 50 cents. Apply to Joseph M. Wade, Hartford, Conn.

SNAKES IN WINTER.—A correspondent writes us from Stoverstown, saying:—"Mr. Jacob K. Shell, of Stoverstown, North Codones Township, York county, recently exhibited to a friend four large snakes of the water-snake variety, which he had hung across a pole near his spring house, where he had killed them on the 18th of January. This is certainly a strange circumstance to occur in mid-winter, and is an incident which the Editor of FOREST AND STREAM, or some one of the many intelligent contributors to "our" popular sporting paper may probably be able to explain.

ANTLERED DOES.—E. Dickerson, Esq., of Springfield, Mass., writes to us to say, that Dr. G. M. Levette, Assistant State Geologist of Indiana, has at his office in Indianapolis, the skull of a doe with beautiful antlers. They are about half the usual size of antlers of the buck, and are perfect in form.

ANOTHER ANTLERED DOE.—A correspondent sends the following note:—

"An article in your paper of 25th ultimo, on "An Antlered Doe," reminds me that, in the fall of '59 or '60, stopping at "The Forks" of the Au Sable, on my way "in" to the Adirondacks, I was shown as a great curiosity—the head of a deer with a horn growing out of the left side. The head was kept in brine for preservation, and was vouched for as the head of a doe, and as such was considered a great curiosity." W.

THE CHAMPLAIN PICKEREL.—We have received from Doctor J. R. Romeyn, of Reeseville, New York, a box of the fish which occupied the attention of the Hon. Robert B. Roosevelt and Winton C. Watson in our paper last week. There is no doubt whatever as to the identity of the fish. They are the *esox faciatus*, and are described in Appleton's Encyclopædia. They are also to be seen in the tanks of the New York Aquarium. They seldom even grow to exceed a pound and a half in weight.

—The old State House at New Haven, Conn., is devoted to a variety of uses, literary, social and reformatory; and various offices are located there. Prof. Marsh has had his collection of fossil remains from the "bad lands" of Dakota housed in the basement.

—Noticing the southward migration of the Snowy Owl, the Montreal *Witness* says that the tribe are invariably accompanied by flocks of white grouse or ptarmigan, and it has been observed that when either or both of the birds have been unusually abundant around Montreal and Quebec, the winter has been more than ordinarily severe to the northward.

AN INQUIRY.—Our correspondent, G. H. Ragsdale, writing from Gainesville, Cooke county, Texas, says:—

"Can you name the following owl from the description which follows? Sex, male. Size; length, 9.3; extent, 24; wing, 6.7; tail, 3.3; nearly square; no ear tufts; Tarsus, 1.9; scantly feathered in front; 1ct., 7; 3ct., 1.1; bristly; claws black; weak and but moderately curved; 3d, primary, the longest; 1st and 2d (only) emarginate on the inner web; eyes with light yellow ring; bill. 65; lead color; cere darker and tumid; nostrils circular; eyelids white; ears moderate; superciliary hue white; the general color above and below is dark brown (the color of Prairie Hen); the wings, tail and under parts banded with white; head, dorsal areas and rump spotted with white; chin pure white; middle throat with a collar of brown and white; lower throat pure white; lining of wings and under tail coverts buff. I have never seen one like it. I dug it out from under a flat rock in open prairie, but near a creek. For two weeks we have had birds singing and grass growing like spring. Harris Sparrows, Lecontes Sparrows, Goldfinches and many others that appeared to be gone while it was so cold, are here now."

The measurements and proportions seem to agree most nearly with those of the Burrowing Owl, *Speotyto cunicularia* var. *hypogaea* Coues. The fact of its having been dug out from under a rock seems to favor its reference to this species

OUR PRESENT KNOWLEDGE OF THE NIDIFICATION OF THE AMERICAN KINGLETS.

IN the hope of eliciting from some of the many readers of *The Bulletin* further information concerning the breeding habits of the American Kinglets, or at least putting them upon the alert for further information, I have deemed it well to bring together what is at present known respecting the nidification of these birds.

Of the breeding of the Ruby-crowned Kinglet (*Regulus calendulus*), not much is known, although the bird is found at different seasons in all parts of North America. In the Rocky Mountains it breeds among the most elevated forests. Mr. J. A. Allen found young in July near Mt. Lincoln Col.; Mr. Ridgway gives it as breeding among the peaks of Northern Utah; and Mr. Henshaw in Arizona. It is also supposed to breed in Northern New Jersey, in Western New York, in Maine, and in the islands of the Bay of Fundy. In Western New York a nest which contained young was reported to have been built in the fork of a tree. Males and females have both been observed in summer about Chestnut Hill, Philadelphia, and Mr. Gentry thinks it nests on the wooded heights along the Wissahickon. Dr. Coues in his "Birds of the Northwest" considers that he has sufficient evidence to show a breeding range throughout the mountains of the west from 9,000 feet upward, thence breeding eastward along the northern boundary of the United States to Maine and Labrador, and probably sending a spur southward along the Alleghany Mountains. Northwestward it reaches Alaska.

The most satisfactory information is furnished by Mr. J. H. Batty, who found a nest near the Buffalo Mountains in Colorado, on June 21st, 1873, which contained five young and one egg. The nest was on the branch of a spruce tree, about fifteen feet from the ground, and was so large "that it could scarcely be got into a good sized coffee cup. It is described as "a loosely woven mass of hair and feathers, mixed with moss and some short bits of straw." The egg, Mr. Batty tells me, was very much like that of the common House Wren, but a little lighter in color. Both parents were assiduously bringing larvæ of insects to the young, whose appetites were unappeasable. Mr. Henry W. Henshaw also reports finding a neatly finished nest on a mountain near Fort Garland, Col. It was built on a low branch of a pine, and the male was singing directly overhead; but although he waited some time, Mr. Henshaw did not see the female. "The nest was a somewhat bulky structure, very large for the size of the bird, externally composed of strips of bark, and lined thickly with feathers of the Grouse." Of the eggs of this Kinglet nothing further is known.

Little more can be said in respect to the Golden-crested Kinglet (*Regulus satrapa*, Licht.). Its range is nearly as extensive, but more northerly; it does not descend in winter beyond Mexico. Nothing is known with certainty of its breeding anywhere in the United States, although it may be found to do so in the northern mountainous portions. Mr. Thomas G. Gentry is confident that it nidificates in cavities in the tall trees which crown the heights of Eastern Pennsylvania, despite the generally accepted notion that it follows its foreign cousin in building a pensile nest and laying white eggs, finely sprinkled with buff dots, in size about equal to those of Humming birds. It has also been inferred that this Kinglet raises two broods in a season. Mr. Nuttall and Dr. Cooper both found it feeding full-fledged young on the Columbia river, on May 21st; and Audubon observed the same thing in Labrador in August. Mr. Maynard found it common at Lake Umbagog, Me., in June; he says it breeds there, and that, judging from the condition of female specimens dissected, it deposits its eggs about June 1st. Several pairs were found in the thick woods there, but no nests could be discovered; he thought they built, probably, in the long hanging moss so abundant on the trees in those northern forests. Mr. Herrick puts it down positively as breeding on the island of Grand Menan, and Dr. Brewer in Maine. Mr. Allen informs me that he met with young, attended by the parents, the third week in August, 1876, on Mount Monadnock, New Hampshire, which he has no doubt were hatched in the immediate vicinity. Mr. J. K. Lord states that these birds were abundant on Vancouver's Island and the adjacent coast, where he found them building pensile nests suspended from the tips of high pine branches, in which they laid from five to seven eggs. He does not describe the eggs, which was hardly to be expected, perhaps, considering the half-use he seems to have made of his opportunities.

Herr F. W. Baedeker has figured the egg in the *Journal fur Ornithologie* (1856, p. 33, Pl. I, Fig 8), and also in his large work on the eggs of the birds of Europe. Dr. Coues observes, in a private communication to me, "The plate indicates a rather roundish egg, though the two specimens figured differ noticeably in size and shape; they are spoken of in the text as 'niedliche kleine Eirchen mit lehmgelben ben Flekschen auf weissen Grunde,' and compared with those of other species illustrated on the same plate."

Regulus cuvieri, described by Audubon from a specimen taken near the banks of the Schuylkill river, has remained unknown to ornithologists ever since.—*Ernest Ingersoll in Bulletin of the Nuttall Ornithological Club.*

OCCURRENCE OF THE BLACK RAIL IN MASSACHUSETTS.

EDITOR FOREST AND STREAM,—

I read with much interest the article on our Rails, in the number of FOREST AND STREAM for November 9th. Believing it desirable for any one who can furnish an item which may contribute to the advance of ornithological knowledge to do so, and noting your remark as to the rare occurrence of the Black Rail (*P. Jamaicensis*), I write to say that I have a specimen of the above, obtained in this State in August, 1869. It was picked up dead on the shore of Clark's Island, Plymouth, by a cousin of mine, who, in a residence of sixty-five years on the island, had never seen the like before, and forwarded it to me as a *rara avis*, which, indeed, it proved to be. By request of a member of the Nuttall Club, of Cambridge, I sent the skin to be exhibited at one of their meetings, where it was pronounced the first and only specimen for Massachusetts, and the third for New England, and so put on record, *vide* Article by H. A. Purdie on "Birds of Rare Occurrence in N. E.," p. 22, Vol. II, No. 1, of Bulletin of Nuttall Club.

Yours truly, F. C. BROWNE,

Framingham, Mass., January 28th, 1877.

THE BIRDS OF WEBSTER AND ADJOINING TOWNS.

BY CHARLES F. GOODHUE.

TURDIDÆ—THE THRUSHES.

Turdus migratorius, Robin. Common summer resident; breeds.

Turdus Fallasii. Hermit thrush. Common; breeds, one of the most common of the thrushes.

Turdus fuscescens. Wilson's thrush, Not so common as *T. Fallasii*, but breeds.

Turdus Swainsonii. Olive-backed thrush. Quite rare; have taken but one nest.

Seiurus aurocapillus. Golden-crowned thrush. Oven bird; common, breeds in the woods everywhere.

Seiurus novaboracensis. Water thrush, Not common; may breed as I have taken it in midsummer.

Harporhynchus rufus, Brown thrush. Common summer resident; breeds.

Mimus carolinensis. Cat bird. Common; breeds abundantly.

SAXICOLIDÆ—ROCK INHABITERS.

Sialia sialis. Bluebird, Very common; breeds everywhere.

SYLVIIDÆ—THE WARBLERS.

Regulus calendulus. Ruby-crowned kinglet. Common spring and autumn migrant.

Regulus satrapus. Golden-crowned kinglet, Abundant in winter; may breed, as I found it on Kearsarge Mountain on June 22d, 1875.

PARIDÆ—THE TITMICE.

Parus atricapillus. Black-capped titmouse. Common resident; breeds everwhere.

Parus Hudsonicus. Hudson Bay titmouse. Very rare; took one in November, 1875.

CERTHIIDÆ—THE CREEPERS.

Certhia familiaris. Brown creepers. Resident; common in winter, but rare in summer.

SITTIDÆ—THE NUTHATCHES.

Sitta carolinensis. White-bellied nuthatch. Common resident; breeds, found nest the last of May in a red oak. The nest was in a cavity ten inches deep, dug out of the solid wood, forty feet from the ground.

Sitta canadensis. Red-bellied nuthatch. Resident, but not common. In the summer of 1875 found the birds building on Kearsarge Mountain.

TROGLODYTIDÆ—THE WRENS.

Troglodytes ædon. House wren. Summer resident; has been rare, but more common this year. (1876).

Anorthura hyemalis. Winter wren. Common during the migrations, Took one specimen June 22d, 1875, on Kearsarge Mountain; it was a male in full plumage and song.

MOTACILLIDÆ—THE WAGTAILS.

Anthus ludovicianus. Titlark. Rare migrant; have taken it but once, May 10th, 1875.

SYLVICOLIDÆ—THE WOOD WARBLERS.

Mniotilta varia. Black and white creeper. Common in the migrations; less so in summer. Breeds, nesting on the ground; the nests that have come under my observation have been so placed that the herbage of the year before formed a roof, as it were, to the nest.

Parula americana. Blue yellow-backed warbler. Common in spring and autumn. May breed, but have not found the nest as yet.

Geothlypis trichas. Maryland yellow-throated warbler. Abundant summer resident. Breeds, nesting in swampy places.

Helminthophaga ruficapilla. Nashville warbler. Common summer resident. Breeds, nesting much in the manner of the preceding. The female lays from four to six eggs, usually the latter number.

Dendræca virens. Black-throated green warbler. Abundant summer resident. Breeds, usually in pine woods. Three nests found in 1874; were all placed in pines; two of the nests were built in forks close to the trunk of the tree and about twelve feet from the ground; the other was built on a horizontal limb some five feet from the main body of the tree and fifty feet from the ground; the number of eggs were four, which is, I think, the number usually laid.

Dendræca cærulescens. Black-throated warbler. Rather common in summer. Breeds; places the nest on a horizontal limb of the hemlock six feet from the ground.

Dendræca coronata. Yellow-rumped warbler. Very common spring and autumn migrant. May breed; have seen the adult here in midsummer. Were very plenty on the mountains June 23d, and probably had nests, but did not find any, as I did not have time to look carefully.

Dendræca castanea. Bay-breasted warbler. Rare, probably breeds sparingly, as I have seen the young being fed by the old ones in the latter part of July, they being at that time hardly able to fly.

Dendræca Blackburnia. This beautiful warbler is quite common in summer. It breeds without doubt, as I have seen the young often, but owing to the secluded habits of the bird have not been able to find its nest, as they keep in the deep woods and large trees I think they must breed in such places.

Dendræca pinus. Pine creeping warbler. Not common; think it breeds, as it remains through the summer.

Dendræca pensylvanica. Chestnut-sided warbler. The most common of the *Dendræcæ*; breeds everywhere in low bushes.

Dendræca striata. Black-polled warbler. Common in the migrations.

Dendræca æstiva. Yellow warbler. Common summer resident. Breeds usually near a stream of water in meadows and in intervals. The cow bunting often deposits its eggs in the nests of this species.

Dendræca maculosa. Black and yellow warbler. Common spring and autumn migrant; often remains through the summer.

Dendræca palmarum. Red-polled warbler. Common in spring and fall.

Perisoglossa tigrina. Cape May warbler. Exceedingly rare; have taken it but once.

Myiodioctes pusillus. Black-capped fly-catching warbler. Not common; exceedingly shy, keeping in low bushes.

Myiodioctes canadensis. Canada fly-catching warbler. Common in the migrations; less so in summer; think it breeds.

Setophaga ruticilla. Redstart. Common summer resident; breed usually in a young growth of birches, pines and the like.

HIRUNDINIDÆ—THE SWALLOWS.

Hirundo horreorum. Barn swallow. Common summer resident. Breeds, nesting in barns and out-buildings. A friend once showed me two eggs of this species no larger than those of the least flycatcher, and thickly spotted at the smaller end.

Petrochelidon lunifrons. Cliff swallow. Eave swallow. Common resident in summer; breeds under eaves of barns and under sheds sometimes as many as fifty pair breeding under the eaves of a single barn.

Tachycineta bicolor. White-bellied swallow. Abundant summer resident. Arrives sometimes before the snow is gone; shot one on the 8th day of April, when there was but very little bare ground and quite cold.

Cotyle riparia. Bank swallow. Very common in summer. Breeds in large communities in the river banks.

Progne subis. Purple martin. Not common. Breeds, nesting in houses put up for them. The blue birds and martins have a battle every spring to see who will have possession of a large martin house in our garden, sometimes one side and sometimes the other victorious. One pair of blue birds will keep six or eight martins at bay.

VIREONIDÆ.—THE VIREOS.

Vireo olivaceus. Red-eyed vireo. Common summer resident, the most so of any of the vireos. Breeds.

Vireo gilvus. Warbling vireo. Common summer resident. Breeds. This species has a warbling song so near like that of the purple finch that it is hard to distinguish between the two.

Vireo solitarius. Blue-headed vireo. Nearly as common as the red-eyed vireo; it is the first to come in the spring. Breeds, nesting on low trees and bushes.

Vireo flavifrons. Yellow-throated vireo. Rather common summer resident. Breeds.

Vireo noveboracensis. White-eyed vireo. May occur, but have not seen it yet.

Woodland, Farm and Garden.

BERMUDA AS A WINTER RESORT.

GARDEN TRUCK FOR THE NEW YORK MARKET.

A BRIEF voyage southward in the steamer to Bermuda, where they connect with other lines to St. Thomas and the West Indies, works a wonderful transition in scenery, climate and all external surroundings. The passenger who embarks on the staunch ocean craft Bermuda or Camina, usually awakes the next Sunday morning to find himself in a balmy atmosphere, and gazing upon a landscape radiant with a perpetual verdure. Already the steamers are bringing to this port copious supplies of new tomatoes and potatoes fresh every day, and by the beginning of April we shall be receiving vegetables from that quarter of every description. Every year increased attention is given by the islanders to what we call truck farming, stimulated by the high prices for agricultural produce which they always command through the early spring months. Last year's reports of this description amounted to about $340,000, which is a pretty good account to give of a population numbering only about 15,000, and inhabiting a group of islands no more than twenty-six miles in extent from end to end. The equable climate is the great charm of this gem of the ocean, ranging in the colder months from 55 deg. to 70 deg. Fahrenheit, and showing less variation throughout the year than is found in any other spot not insular, situated without the tropics. Compared with Nice, Algiers and the Nile the temperature is more genial, in this respect more closely resembling that of Madeira and St. Augustine. The excellent facilities for communication between New York and Bermuda by means of an established steam line, have the effect to start a sort of migration among both the well-to-do and invalid classes, large numbers moving between these points with each changing season. The last steamer from this port took out about seventy first-class passengers, besides others in the steerage, and this travel now in its height will continue for nearly three months to come—wish we were included, with fishing tackle and other appliances for sport. Of good camping there would be no lack. That is a delight. Some land where oleanders form the common fence of the country, growing sometimes twenty feet high; where is found the sage, palm and palmetto, not to speak of figs, grapes, pomegranites and bananas; where marine animal life is varied and abundant, and fish and creatures from abroad of at least 135 species make it their temporary home; besides native residents, such as the cardinal grosbeak, the white-eyed vireo and "chick of the village," etc. Here, porter, get up our baggage.

LILLY OF THE VALLEY.—At this season of the year, when we see so much Lily of the Valley for sale in the florists' windows, we are apt to wonder where and how it is cultivated in such vast quantities. A few particulars thereon may prove of interest. Hundreds of thousands are annually imported into the United States, the greater part of which is grown by nurserymen in Holstein, not far from Hamburg. Millions of crowns, it is stated, are sent out from the establishment of E. C. Harmsen, of Hamburg, with whom it forms the principal object of cultivation. In fall the ground (a sandy loam) is prepared by trenching to a good depth, and a liberal manuring with well rotted manure. It is then laid out in beds about four feet wide, six rows of plants being put in each, a path between each being left for convenience of weeding, hoeing, etc. The plantlets are then placed in furrows three to four inches deep, and covered with at least an inch of soil. After the first frost has set in the beds are thoroughly mulched with well rotted manure, which not only serves to nourish the plants when growth commences in spring, but also acts as a protection during the winter. Moreover, during the succeeding season it prevents annual weeds from getting the upper hand. This is all there is to be done the first season, and nothing but weeding the second and third year is necessary, till about the middle of October the third season, when the plants are ready to lift. The labor of lifting and sorting the flowering roots from the others is quickly performed, and after shortening the roots the pips are tied up in bunches and stowed in a cool house for exportation. For early forcing the strongest and ripest are selected, and are generally planted in beds in moss or sand, and covered at first to a depth of three inches with moss. The heat is raised, from 75° at first, to 88° to 100° after three days or so, liberal watering being given, and as the young shoot progresses the covering of moss is gradually removed, until in about ten days it is taken away altogether. To have the Lily in bloom by Christmas it is only necessary to commence about November 20th, and carry out the preceding instructions, following every two weeks or so with a fresh batch for succession. The great bottom heat is especially necessary for early forcing.

FLORIDA ORANGES.—Orange growers are dissatisfied with northern markets this year, and apparently northern markets are dissatisfied with Florida orange growers. What is the reason? Last year prices were fair, and there was mutual satisfaction. Many speculators began buying this year at last year's prices for shipment, and have lost money. It is not that Florida oranges have suddenly, in a single season, become so plentiful. Go through the State and you do not find such a vast quantity of bearing trees, or trees that are old enough to bear any great number of oranges. Most of them are too young for that. Jack Frost has done the mischief, and all through the winter one great topic of conversation has been "the freeze." When the weather sets in cold down here, and the north-wind hangs on day after day, there is as much anxiety in the face of the orange man as in that of a skipper trying to keep off a lee shore in a gale. This is not the case beyond the frost line of course, but all don't want to go beyond the frost line. Besides this, where is the frost line? The extreme south of the State, we know, is secure; but how far north a man may plant his orange grove in security in this State is a question that is difficult to answer. It is certain that groves miles south of this point suffered worse than those of Mandarin, Jacksonville, or even Fernandina; and even Indian River has complained of the frost.

If you want to tell a good orange, feel the weight of it. It ought to be heavy. Northern papers say that every third orange from Florida is worthless—spongy and light—and that is the way Jack Frost works, and soon they rot. I attribute the poor market to the poor condition of the fruit from the frost. After a freshly night look at your orange trees. The leaves are curled a little, but if your fruit is not shriveled a grain you may be all right. Wait a week or two, though, and if your oranges keep their smooth, glossy appearance, and stick to the trees, you have come out safe. But the oranges have dropped this winter, and the ground has been as yellow with them as the fields north are with dandelions in the early spring. "O, you are too far south," said a gentleman to an Indian River man, who was grumbling about the freeze in his vicinity; "you ought to come up near Jacksonville." The other smiled at this unusual advice. "Why, do you know where the finest oranges in Florida are raised? those that took the premium at the State Fair?" No." "Well, in Fernandina."

KEEN OLD FARMER.—Farmer Hodge had an eye to business. One hot day last summer he hung up his old horse in the shade of an apple tree near the country tavern, and going into the hostelry ordered four quarts of oats for the beast. These were furnished; and while Dobbin munched at his fodder and stamped off the flies that pestered him, Farmer Hodge drank beer on the porch! When the time came to settle the score, "How much?" demanded Hodge. "Twenty-five cents." "Um-um, twenty-five cents? That's fair enough; but look-a-here (pointing to the well pounded earth under the apple tree where the horse had stood) how much are ye goin' to deduct for the manure?"

A sharp eye to business had Farmer Hodge.

SMILAX.—I often see directions for growing smilax. Whether they come from practical cultivators I know not, but if so, their experience and observation differ very widely from mine. We are told that smilax will flourish in partial shade, or, to quote verbatim: "The vine does not need the full sun." With me it does require the full sun. In any other place the vine, it is true, will continue to grow; but it will remain almost leafless. I have tried repeatedly to decorate, with it, the ornaments on pictures over a mantel—having some considerable length of vines to begin with. All of them remained fresh and fine, but the new growth was of no account—yet the mantel was flooded with light from windows directly opposite. I have often grown it out of doors on a very delicate wire trellis, three feet high and a foot and a half wide. In autumn I bring it to the living room and set it in an ornamental pot or vase on a small table between two sunny windows—the back of the trellis against the wall.

In my experience the mature leafage, in these trials, remains unchanged during the winter, and forms the commencement of a charming embellishment. Tender sprays branch out at every point—often in great luxuriance. The running vines on the top of the trellis, I am obliged to train off on threads stretched across the windows that they may get the strongest light—the hottest sun. When two or three yards of vine, covered with bright, glossy leaves, are well grown, I take it from the window and run it on the wall, embracing bracket, picture, or whatever I may happen to have above the trellis. I then carry it to the ceiling, and, when I get enough by repeated growths, festoon it over the curtain; run it across on the cornice, or dispose of it in any way that fancy may dictate. For a fine effect and the most graceful ornamentation nothing equals the smilax, but it will not flourish for me, nor for any of my acquaintances, without the full sun.

For the benefit of those amateur florists who have failed in the cultivation of this plant, I respectfully submit this record of personal experience. To grow a small specimen of smilax amounts to little. We want it for ornamentation. A sample of goods is useful in its way, but the real benefit is in having enough for a full suit.

Smilax is easily grown from the seed, though it takes several weeks to germinate. It requires a rich soil, and when the growth is rapid, much water. Although a perennial, young plants do better than old. Put several in one pot if you wish a large growth, and keep a warm, thick mat under the pot, if it stands on marble. Fulfil all the conditions of success; give light, heat, drink, and you will have a thing of beauty, which will be a joy for the season, to say the least.—*J. E. J. to American Garden.*

BEET ROOT CROP IN FRANCE.—It appears that the past has been a very disastrous season for the French beet root sugar works. It is said that out of 438 factories, which were in operation in 1875, only 184 are still in existence. The quantity of beet juice treated was 964,617 hectolitres, as against 4,388,501 hectolitres in the first month of last season, and its average density was 10 per cent. lower. The stock of sugar turned out was less than one-fourth of the amount in September, 1875, the figures being 5,023 and 22,979 tons respectively; while the quantity obtained from each hectolitre of juice is but 3.60 killogramme, as compared with 3.88 in 1875. It is also stated that deterioration in the sugar yielding quality of the beets has been going on for a number of years past.—*N. Y. Shipping List.*

Furs and Trapping.

HINTS TO TAXIDERMISTS.

As all collectors know after a little experience, there are certain genera of birds in which, from the large size of the gape and the smallness of the neck, it is impossible, in skinning, to pass the skin over the head so as to clean the skull—*e. g.*, the genera Rhipidura, Myiagra, Tchitrea, and others; also the woodpeckers, some of the parrots, and the ducks. Books on taxidermy tell you to make an incision from the forehead to the back of the head, along the top of the skull, which you must turn out through the cut, and, after cleaning, replace, sewing up the severed skin. This is what I have done for forty years, according to my lights.

A "happy thought" occurred to me some time since in Fiji, while skinning a small thin-skinned Rhipidura. I drew the neck through the skin till I got to the base of the skull; into this I plunged the points of my scissors, cutting it away with the palate, by three cuts forming a triangle, the apex at the hinder junction of the neck; the base across the palate. Drawing away the neck left the brain exposed; this I cleaned out, and compressing the skull at the base of the lower mandible, it slipped through the skin of the neck as easily as possible, enabling me to clean it, apply the preservative, stuff the orbits, &c., and slip it back again in the same manner. It did not take me half so long to do as to describe, and the saving of time in the sewing up of the skin of the head as in the old process, and the better appearance af the specimen (letting alone the saving of trouble), is "prodigious."

I don't know if it will answer for woodpeckers and ducks. We have none of the former in these latitudes, and I have not come across any of the latter since I made the discovery; perhaps some of your readers will try the plan and "report progress." It has answered for some big-jawed parrots, and with the strong-billed "kagou" (Rhynochetos jubatus) of N. Caledonia.

While I am writing, I may as well mention another little "wrinkle" I have lately added to my horns. It may be useful to some of your readers in the tropics. With the thermometer at 100° in the shade, birds shot in the morning are often "unskinnable" at night—and next morning, whew! Well, it occurred to me to inject carbolic acid into these parts that decompose the soonest, *e. g.*, the brain, the throat, and the viscera; so I got one of those small syringes with perforated needle points used for ejecting opium and other narcotics under the skin, and I injected a few drops of carbolic acid into the brain (through the palate) down the throat, and into the viscera (through the vent) with the happiest result. It hardened the parts, and effectually prevented decomposition for many hours. I have since kept a bird "skinnable" for a week, while another hung alongside it was putrid and fly-blown in twenty-four hours; so that I skinned birds that otherwise I should have utterly lost. The brain became like cheese, the eye white and hard, as did also the viscera.

I hardly need point out the advantages of this to a traveller in the tropics, or even to a stationary collector who happens (as has often occurred to me) to come across an exceptionally "good day."—*London Field.*

INSTRUCTION IN TAXIDERMY.—We have received from the Naturalist's Agency a copy of Mr. C. J. Maynard's "Naturalist's Guide," bearing on the title page the date 1877. Although first published in 1870 and extensively noticed by the press at that time, there seems to be good reason for again calling attention to the work. We frequently receive from correspondents inquiries in regard to the best way of preserving objects of Natural History, and we have on former occasions published a number of articles on Taxidermy. The ground, however, is too extensive to be covered by these, and we cordially recommend Mr. Maynard's book to such of our readers as desire information on this topic. It contains a large amount of information of the greatest practical value to the young naturalist, and there is much between its covers from which the more experienced collector may gain useful hints.

The work is divided into two parts, the first of which is entitled "Directions for Collecting, Preserving, and Mounting Birds, Mammals, Fishes, etc., etc," while the second is devoted to a "Catalogue of the Birds of Eastern Massachusetts," with Notes Relative to their Migrations, Habits, etc. Mr. Maynard, as a practical taxidermist, knows what he is writing about, and his directions for making skins are full and complete. Besides the information which the book affords concerning the collecting and preservation of vertebrates, several pages are given to directions for the successful collection of the lower forms of life so that the book is not simply a "Guide" for the collection of birds and mammals, but is of value to the young collector in whatever branch of Zoology he may be interested.

The most valuable portion of the work, however, is in our opinion, Part II; in which is given a list of 299 birds which have been found in Eastern Massachusetts, together with a great deal of valuable information drawn from the authors note book. To the New England collector the "Guide" is a *sine qua non.*

TANNING SKINS.—In answer to a correspondent, the Massachusetts *Ploughman* gives the following directions for tauning sheep skins so the wool will stay on:—

"Take salt and alum in equal parts, pulverized, and sift about four ounces on the flesh side of the skin when it is fresh from the body, or if it has become dry moisten it, and then apply the mixture, and fold the skin up carefully and keep it in a damp place about four days, then open it and lay it on a table and scrape it with a dull knife to get all the adhering flesh off, then rub it with a blunt wooden instrument till it is dry and soft. Then wash it thoroughly in warm soapsuds, let it dry moderately, and just before it is fully dry rub it soft with the hands. After thorough rubbing it is soft and pliable as a kid glove, and will continue so.

Some nail the skin smoothly and tightly against a door or board with the flesh side out. Then with a blunt broad bladed knife scrape away all loose pieces of flesh and fat, then rub in as much chalk as possible, not being sparing of "elbow grease" or labor. When the chalk begins to powder and fall off, take the skin down and fill it with finely ground alum, then wrap it closely together and keep it in a dry place for two or three days, then unroll it, shake out the alum and the thing is done.

If it is desired to dress the skin soft, like buckskin, take it fresh from the animal and stretch it tightly on a board, and scrape off all the flesh that will come off easily. Warm two quarts of milk and mix in a teacupful of salt and half an ounce of oil of vitriol. In this mixture soak the skin about forty minutes, stirring it and keeping it warm. Then take it out and stretch and rub it over the smooth edge of a board, working it until dry. The Indians are said to have the secret of preparing buffalo hides and deer skins by soaking them in a paste made of brains, and, after rubbing them, drying them in smoke. Whether this is the way they do it or not we cannot say, but they certainly know how to do it in some way or other, better than we have ever seen them prepared by white men. Perhaps it is owing to more patient and long continued rubbing.

WEST POINT, Arkansas, Feb. 14th, 1877.

EDITOR FOREST AND STREAM:—

I inclose some notes on "Ratt Creek," where trapping is good, and we have been very successful.

Ratt Creek is a small sluggish creek of about fifteen miles in length, widening out into small lakes and large cypress ponds in its tortuous course into White river. As soon as we saw it we thought we had struck a good trapping ground, and the following day put out a fair number of mink traps, and a few for otter, although the otter sign was not so plentiful as coon and mink. In viewing around up and down the creek we found numerous fresh deer track in our daily visits to our traps, but our experience has always been that a trapper who attends well to his traps has no time to hunt after other game, and although we nearly always carry our shot gun we seldom look for any game except ducks and rabbits to bait the traps with. One day last week as we were going into the bottom alone, we started three fine deer out of a thicket of bushes and cane near the trail to the traps; of course, we did not have our "Winchester," and the shot gun was loaded with duck shot, and our only satisfaction was the pleasure of seeing those white tails loping away through the timber. Baley lake is about a mile below where our traps are setting, and is much visited as a fishing resort by the people living back on the hills. The water is deep, and fine buffalo and perch are now being taken with the hook and line. Although the lake is right in the bottom and subject to six feet overflow from White and Little Red rivers, there is about twelve acres on the north bank of the lake entirely above any high water which would be a pleasant camp ground at any time of the winter. It is scarcely worth while to go into detail as to the number of varmin we are catching, but we can say our success in the short time we have been here has been much better than in Mississippi, and taken altogether, our catch has been good. SHETHAR-BOZNAL.

ATTICA, Ohio, Feb. 10th, 1877.

EDITOR FOREST AND STREAM:—

After reading "Buckshot's" communication I considered it my duty to give to the readers of the FOREST AND STREAM an account of a grand fox hunt which took place near here on last Friday, Feb. 9th.

The morning came, and at an early hour the horns and drums, and horse and devil-fiddles could be heard in the streets of our little village. The boys and men all started at 8 o'clock, in order to scour the woods between here and the starting point. The lines were formed and started to close at 10 o'clock sharp. The lines then proceeded cautiously to the closing point, as we neared which could be heard the shouts of men and boys as the foxes tried to make their escape through the lines. Owing to the hunt being poorly managed, and some misunderstanding between the marshals, a partial failure was the result. Two red and grey and one black fox made their escape, but when the lines were properly closed we found within one large red fellow. Now the fun commenced in earnest. Reynard found himself outwitted, for the lines were perfect with more than three hundred on each, every one making a noise. At our first sight of the fox we thought he was nearly run down, but he doubled the field, which was some twelve times eighty rods long, before he showed much sign of real fatigue. The lines then closed in to a much smaller compass, when the fox was caught and permitted to take breath for fifteen minutes. While the fox was resting four boys of ten or twelve years of age stepped into the arena; the fox was then turned loose, the boys giving lively chase, until one of the boys caught him, but happened to catch him by the wrong end. The fox finding himself at liberty to bite, did so, inflicting a severe wound on the little fellow's wrist. He was promptly choked off, and was then put up and sold for $3.50, which paid the expense of advertising.

Foxes sometimes sell at our hunts as high as $6. I am of the opinion that "Buckshot" made a mistake in regard to the number of square miles inclosed. It should have been four miles square, instead of four square miles. Sportsmen in this locality are using every endeavor to preserve the quail, and I am happy to say that prospects for shooting next fall are very good. At present we are looking forward to spring, when we will have fine snipe shooting on the marsh surrounding the great pigeon roost a few miles east of this place. J. W. S.

TO FISH CULTURISTS.—Please observe the suggestions of "Piscator" in our Fish Culture Department.

Answers To Correspondents.

☞ We have one column of Answers in type which are unavoidably left over, and will appear in our next issue.

BADGER, Berlin, Wis.—Wm. Malcom, of Syracuse, N. Y., makes as good a telescope for rifles as any one can and makes a specialty of same. TOP SNAP.

W. F. R., Coving, Ky.—Can I find good duck shooting between St. Louis and Little Rock on or near the Iron Mountain R. R. in Arkansas about the 1st of April? Ans. It is a good ducking country, but April is rather late.

W. McM., Bedford, Pa.—I have a muzzle-loader 12-bore. It does not shoot close enough for this kind of work. Would like to have it choke-bored. Ans. It will cost you $5. Send the whole gun to H. C. Squires, No. 1 Cortlandt st., this city.

SUBNAME, Chillicothe.—What is the easternmost point in the States where elk can be found—I mean the Wapiti, not the moose? Ans. We know that elk are quite abundant in Tuscola, Huron and Saline counties, in Michigan, but we have not heard of them any further east.

J. M. E., Elmira, N. Y.—Can you send me Col. Wingate's Annual Report or tell me where I can get it? Ans. Address Col. Geo. W. Wingate, No. 208 Broadway. It will probably be in the next annual report of the N. R. A., or at least it should be.

J. H. C., Ashland, Va.—At what age should the operation of spaying be performed on a bitch? If the operation should be performed at the right time will she at some time afterwards go in heat? Ans. Before the puppy is ten weeks old. The bitch will never come in heat.

E. W., Lakeville, Conn.—How many can be counted for two sixes and three threes? Some claim fourteen and some eighteen. I favor fourteen, because the threes having been used singly with the sixes in pairs cannot be used together with the sixes singly. Ans. The hand counts eighteen.

J. C., St. Louis, Mo.—Where can I buy three dozen summer duck eggs, and what will I have to pay for same? A friend in England wants them for hatching. Ans. Address D. Gilpin, Concordville, Delaware co., Pa., or G. O. Brown, Brooklandville, Md.; these men deal in eggs and fowls.

G. H. N., Cranston, R. I.—In your paper of January 4th, page 339 you speak of an advertisement in the *Clipper*. I wish to correspond with the author of that notice, but am unable to find it in the *Clipper*. Ans. We have not the man's address. Better correspond with the *Clipper* Editor.

O. J., Boston.—Can you inform me where I can get a spayed bitch pup from eight to twelve weeks old, color orange and white with black nose and eyes? Ans. If a pointer will answer you may be able to get a Sensation-Whisky puppy from the Westminster Kennel Club. Address D. W. S. Webb, No. 7 West Fifty-fourth st., this city.

C. T., Claremont, Min.—Is there a paper published in Chicago called *Bridal Bells*? It was published last year. Has it been discontinued? Ans. No such paper as *Bridal Bells*. There was one called *The Bridal Veil* published there, but it had a short life and went up last spring or summer.

GUNSTOCK, Boonville.—The stock of my breech-loader is too straight and I would like to know where to send it to get it remedied and what would be the probable cost for from half to three-quarters of an inch extra drop? Ans. Send your gun to H. C. Squires, No. 1, Courtland street; cost $3 50.

J. L. C., Richmond, Va.—Please furnish a reader of your valuable paper information as to the habits of the shad and the taking of this fish with the fly. Ans. Vol. II of FOREST AND STREAM devotes a good deal of space to the consideration of the shad and its habits as a game fish. We have sent you selected articles. There are some twelve in all.

YELL, Jacksonport, Ark.—There is a work called the "Naturalists Library," of which Messrs. Lippincott & Co., of Philadelphia own the plates. It was edited by Sir William Jardine, and is in over forty volumes. Is it a good and comprehensive work as to the animals and birds of America? Ans. Very good as far as it goes, but now somewhat out of date.

W. M. A., Schenectady.—I am desirous of entering my setter in your Kennel Register. Will you kindly inform me, through your paper, how to do so, or if I must fill out a blank. Will you send me one? Ans. Fill out the blank pedigree we have sent you and return it. Pedigrees for the first volume of the Register will only be received for a fortnight longer.

FRED L. R., Longwood, Fla.—My dogs and horses are often greatly troubled with ticks. What will take and keep them off? Ans. The ticks must be picked off in the first place, but we doubt if anything can be put on to keep them from returning in time. "Dink's" recipe may answer—a teaspoonful of snuff in a pint of gin.

SUBSCRIBER, Ancram, N. S.—I have an orange and white setter bitch nearly thirteen months old, and she has not been in heat yet and shows no signs of being so. What do you think is the matter with her, or is it all regular? Ans. It is usual for a bitch to come in season when she is twelve months old, but they sometimes go longer. We should not advise you to breed from her the first time.

GLENS.—1. Which will sail the faster of the two, hulls the same, a boat cat or one sloop-rigged; same amount of canvas. 2. Can a sloop or schooner sail within two points of the wind? 3. Of the two which will sail the closer to the wind a sloop or cat-rigged boat? Ans. 1. In light winds the cat-rigged boat would probably be the fastest; in a seaway the sloop. 2. No. 3. The cat-rigged boat.

W. H. B., Wilmington, N. C.—Please describe simplest method of administering castor oil to a dog eighteen months old. Ans. Take the dog between your knees with his head facing from you. Open his jaws with the finger and thumb of one hand, and with the other pour the oil down his throat; by stopping his nose the dog will be compelled to swallow. Castor oil can now be had in capules, which are much easier to administer.

W. H. A., Jersey City.—1. Can you inform me where I can buy feathers of different colors, and mohair and other requisites for making artificial flies? 2. Can you direct me to some gentleman that is familiar with dogs, because I have a dog which I think is a cocker spaniel, and I would like to know if it is? Ans. 1. You will have to pick them up separately; one here and another there. 2. Bring your dog here and we will tell you his breed.

W. C. B., Williamsport, Pa.—1. Intending to purchase a gun we wish to know which is the most reliable firm who advertise their guns in your columns? Please say what gun would suit for us, say $75. We will pay more, if necessary, for a good gun. 2. What part of Maine furnishes the best hunting and fishing during the summer months? Ans. 1. All the dealers who advertise in our columns are reliable, and we cannot discriminate between their wares. 2. As a seaport, Castine.

NEMO, Cleveland.—1. Where can I get a complete cheap copy of the game laws of Pennsylvania? 2. What section of Pennsylvania is the mildest and most abundant in large game—deer and bear, and also trout? Ans. We can send you a copy of "Fur, Fin and Feather" (price 50 cts.) with the game laws of all the States. 2 For large game go to Pike co.; take Erie Railway to Lackawaxen, and thence conveyance to Westbrook's tavern where you will find hunters.

J. C. C., New York.—In your Answers to Correspondents will you kindly oblige by answers to the following: 1. Weight of Remington gun as supplied to the N. G. of this State. 2. Length of barrel. 3. Diameter of bore. 4. Weight of slug. 5. Weight of gun with bayonette. 6. Weight of gun, bayonette fixed and fully loaded. Thanking you in advance for the above information. Ans. 1. 9½ pounds. 2. 35 inches. 3. 50 calibre. 4. 480 grains. 5. 10½ pounds. 6. Same with weight of one cartridge added.

D. S. C., Middlefield, Conn.—I have a pointer dog 1½ years old which is just recovering from the distemper. Since last fall I have noticed that his hair comes off in spots. The first that I discovered was under his neck; those on the ends of ears and on side of nose seems to be quite sore and spread. Ans. Annoint the bare spots with carbolic salve If the dog has mange, which can readily be ascertained by the appearance and by his scratching, use the basilicon and sulphur ointment so often given in this column.

S. S. P., Bridgeport, Conn.—1. Is the absence of feather for three or four inches at the root of a setter's tail an indication of good or poor breeding? 2. Is a dropper the offspring from a setter and pointer only, or from any two different breeds? 3. What is a full authenticated pedigree of a dog? Ans. 1. In some breeds, particularly the Gordon, the feather should commence three or four inches from the root. 2. The term is applied only to the cross of setter and pointer. 3. One in which adequate proof of the progenitors of the dog being as represented accompanies it.

SUBSCRIBER, Brooklyn.—1. Do you think it advisable to have a muzzle-loader changed to a breech-loader; if so, would you be kind enough to tell me about the cost. 2. My setter dog's hair rubs off very easy, and when he rubs against my clothing he leaves a lot of his hair. Would you be kind enough to inform me whether this is any disease, and if so, what would be a good cure? Ans. 1. It would cost you about $50, and unless it was a very fine gun we should not advise it. 2. The dog is probably shedding his coat; a bolus of tar the size of a hickory nut would expedite the shedding.

C. F. G., Philadelphia.—I have a red setter pup one year old which is very timid, so much so that I fear I never will be able to do anything with him. Can you tell me if there is anything I can do to give him courage. If he is spoken to sharply he will run in his house, from which it is impossible to move him except by force. Ans. Nothing but the most careful and judicious treatment will cure your puppy. We should recommend sending him to a good breaker. Gladstone, of Boonton, N. J., has the reputation of being able to overcome shyness in dogs.

C. H. C., Jr., Philadelphia.—1. Are there any laws about shooting quails or pheasants out of season, for stuffing, in this State (Pennsylvania)? 2. Is there any difference between a boat tailed grackle and a purple grackle. 3. What is the right load for a breech-loading shot gun, weight eight pounds, and laminated steel barrels, 12-bore 28-inch barrels? Ans. 1. The birds you mention cannot be killed out of season for any purpose. 2. There are different species. The boat-tailed grackle is *Quiscalus major*, the purple, *Quiscalus versicolor*. 3. 3¼ drs. powder 1¼ oz. shot.

H. B. L., Barry, Ill.—Please tell me some manual or text book by which I can learn drawing by myself, as these small places have no teachers? For hunting and target use out west would not a Remington military rifle costing $18 do as well as a Remington sporting rifle costing $36? Ans. The best book we know of is "Minnie Mechanical Drawing," price $4, to be had of D. Van Nostrand, No. 23 Murray street, this city. The same publisher has a little book called "Free Hand Drawing," price 50 cents, which would be useful 2. For general rough work, yes.

N. B. J., Utica.—1. Can you inform me where I can procure a map of that part of Canada which lies north of New York State. I want an accurate map, and one by which I could be guided in traveling through the woods. 2. I have a Remington breech-loader, 12-gauge, 28-inch twist barrels. What kind of powder and how much would you advise me to use in shooting ducks, and what for upland shooting? Ans. 1. Address James Campbell & Son, 25 Front street, Toronto. 2. All depends upon the kind of shooting and weight of gun; for general purposes 3 drs. powder and 1¼ ozs. shot. For size of powder the number corresponding with Hazard's Ducking No. 4.

W. E. M., St. Paul, Minn.—Your Editor-in-Chief once went to Labrador. Perhaps he can inform us of the origin of the word Esquimaux, the question having accidentally arisen in a little Coterie here. Ans. We are glad to be able to answer *ex cathedra* that the term Esquimaux was first applied to the tribe by the interior Indians of Labrador who are known as Nascaupies or Mountaineers. They styled them Ashkimai, which signifies "eaters of raw meat," in distinction from themselves who always cooked their food. Esquimaux is a corruption of the word given by the French explorers who had intercourse with the Mountaineers.

B. M. S., Nelles Corners, Ont.—1. Which of the .22 calibre rifles as considered the best, the Ballard, Remington, Stevens, or Wessons, and are they all chambered for the long .22 rimfire cartridge? If not, what is the charge for chambering them for such? 2. Can the H. & G. air gun be relied on for accuracy up to 50 yards, and is it chambered for the long shell .22 cal. 3. What will it cost me to have the F. & S. bored—a six months' lot of them? Ans. 1. There is but little difference, and they are usually chambered for the short cartridge. They can be rechambered at a slight expense, not exceeding a dollar or two. 2. No; chambered for the short cartridge. 3. $1.50

YELL, Jacksonport, Ark.—What is the difference between the oysters of the gulf coast of Florida, Texas, etc., and those of Chesapeake Bay? 2. Which is of the better quality, and to what cause may the difference be attributed? Ans. There are as many varieties of oysters on the gulf coast as on the Atlantic, and they differ as greatly in quantity, size and flavor. From our own experience we should hesitate to say that the best oysters of the gulf coast were inferior to the best oysters of the Chesapeake Bay. The impression that the oysters of waters in low latitudes are inferior is derived from the fact that reefs and bars of worthless "coon oysters" are so constantly encountered as seriously to obstruct navigation.

J. S. S., Hazleton, Pa.—My setter pup ten months old has had a very severe attack of distemper, and though apparently cured of the disease has never been able to walk since on account of a weakness in his back. It is fully a month since the discharge from his nose and eyes ceased and he began to mend. His appetite is good and he eats all of the beef broth and corn meal mush that we give him. What I would like to know is whether there is any prospect of his regaining his strength? Ans. Your dog has chorea, which we doubt can be entirely cured. It can be much alleviated, however, by careful clothing, feeding beef broth and boiled milk. The following tonic is recommended by a well known authority: Take of iodine of potash and nux vomica, of each two grains; bromide of potassium, three grains; and subcarbonate of bismuth, ten grains. Mix, and give half, once a day, in a little broth. Continue until it is apparent it is no longer needed or useful.

E. C. M.—1. I have a gun (muzzle-loader) which was imported from England by a man named Tome, and was for sale and advertised by the *Spirit of the Times* about November 21st, 1852. The barrels at least were imported, and were made by Joseph Manton, of England. The stock was by John Mullen, of New York; it cost $150. What should you think it is worth? It weighs 7½ lbs.; barrels 30 inches, 14-gauge, and would it be advisable for me to have it choke-bored, and if so, how much would it cost? What load would it require of both powder and shot? 2. Is there any powder just as good as Hazard's Electric powder not costing so much? Ans. 1. The value of a muzzle loader at the present day depends entirely upon the desire of a person to possess it. You can have one barrel choke-bored at an expense not exceeding $5. The proper charge for it would be 3 drs. powder and 1 oz. shot. 2. Hazards Ducking is quite as good for ordinary shooting as the Electric and costs less.

—That which is good for the delicate skin of the baby is no less delightful for the use of mature people. It is, therefore, that B. T. Babbitt's Toilet Soap, a new article just put on the market, merits a word of praise. Made of the purest vegetable oils, and without artificial scent, it is simply the perfection of soaps for toilet use, whether for old or young.—*Adv.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, FEBRUARY 22, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

SNOW IN WARM LATITUDES.—We are informed by correspondents of ours who are trapping in the Southwest, that, during the extraordinary cold weather in the middle of last January and the wide prevalence of snow storms over the country, the snow in some parts of Mississippi laid at an even depth of fifteen inches; in Shreveport and Monroe, Louisiania, and in Dallas and other parts in Texas it remained on the ground several days at a depth of six to ten inches on a level.

BLOOMING GROVE PARK.—The annual dinner and ladies reception of the Blooming Grove Park Association given at the Hoffman House on Tuesday evening of last week, was one of the most agreeable affairs in which it has been our fortune to participate. The dinner itself was excellent, thanks to Mr. Reid, one of the proprietors of the Hoffman, and who is a member of the Association. After dinner Col. Bruce made an address in which he gave an account of the progress of matters at the Park. He was followed by Judge Gildersleeve, who gave an amusing account of some of his experiences on the Bench. But the most felicitous speech of the evening was that by our friend Mr. John Mullaly, who swings figures of speech with the same gracefulness with which he casts a fly. After some music by Mr. Pattison and the reading of the following letter from the the Grand Duke Alexis, the company adjourned to the parlors when dancing was kept up until a late hour.

R. T. FRIGATE SVETLANA, }
Norfolk, Va., Feb. 7, 1877. }

John Avery, Esq., President of the Blooming Grove Park Association:

SIR.—The Grand Duke Alexis desires me to express to you His Highnesses thanks for the kind invitation to use your park, and his regrets that he cannot be present at the reception on February 13th. BARON N. SCHILLING.

—We have received from Messrs. Holberton & Beemer, of the Sportsmen's Emporium, a very handy little article in the shape of a lock cork, made of box-wood and rubber. By putting this cork into the bottle and giving two or three turns to the key, the contents are safe.

—The British Court of Exchequer has decided that in a prosecution of parties for cutting cock's combs there should have been a conviction, as the act complained of was to enable the birds to be used for cock-fighting, which is illegal.

NOTES ON THE BREEDING HABITS OF GAME

THE breeding habits of all animals possess for the naturalist the greatest interest, and when these habits in game animals are under discussion this interest is extended to a far larger class in our land, the true sportsmen. It will readily be seen that the accurate and detailed information on this head which careful observations of our domestic animals furnishes is not to be obtained concerning the *ferœ naturæ*, and that, given the time at which two individuals of any species pair, the period during which the female carries her young can be approximately determined only by noting the time at which other females of the same species give birth to their offspring. Fortunately, however, the habits of wild animals are very regular in this regard, thus differing widely from those of domesticated species in which all the natural conditions of life are unsettled and altered.

In almost all birds and mammals the pairing takes place at about the same time each year, in the same latitude, and lasts just about so long; rarely more than a month. At this season the habits of all animals undergo a great change, and even those which are ordinarily the most timid and watchful become more bold, and in many cases seem almost to disregard the presence of their great enemy, man. It is at this season, when their horns are hard and strong, that the various species of the deer family have their battles, and sometimes serious ones, and it is then that the elk, the moose, or even the common deer will, when wounded or cornered, attack their pursuer with a fury and a quickness which sometimes makes even the boldest hunter long to be safely astride the branch of a moderately large tree.

The length of time occupied in the hatching of a set of eggs can of course, under favorable circumstances, be determined, as nothing more is required than careful observations extended over a few weeks. Yet it is unusual to see stated, even in the best works on ornithology, the exact number of days during which any bird sits on her eggs. Such a variety of circumstances oppose themselves, even to the most persevering observer, that our knowledge of this and kindred points is sadly defective.

We have prepared the following table, which gives the pairing season, and the time at which the young are born for some of our larger game animals. In its preparation we have made use of all the material at our command, depending in some cases on the standard works on North American mammals, while in others we have relied on the testimony of intelligent and trustworthy men, who have spent their lives in the wilderness, and whose opportunities for observation have been the best possible. Our field notes, too, accumulated during half a dozen seasons' work on the plains and in the mountains of the west, have furnished some evidence. The table is believed to be approximately correct for this continent between the 42d and 49th parallel:—

Name.	Rut in	Young born.	No. of young.
Moose (*Alce americana*).....	Sept.....	May.....	Generally two.
Caribou (*Rangifer caribou*).....	Oct.....	June.....	
Elk (*Cervus canadensis*).....	Sept.....	About May 20..	One.
Black-tail or mule deer (*C. macrotis*).....	Latter part of Oct.....	Last of May or early in June.	Ordinarily two.
Virginia or white-tailed deer (*C. virginianus*)...	Early in Nov.....	" "	Two or even three.
Antelope (*Antilocapra americana*).....	Last of Oct. and first Nov.....	15th to 20 May.	Two.
Bighorn, Mt. Sheep (*Ovis montana*).	early in Dec.....	Last of March.	One.
Buffalo (*Bos americanus*).....	July.....	About April 10.	One.

DISCOVERY OF A BURIAL PLACE OF NEOLITHIC AGE IN FRANCE.

IN a recent number of *La Nature* an account is given of the discovery of an ancient Burial Place, in the commune of Brezé in Anjou, which evidently belongs to the earliest portion of the age of Polished Stone, and which presents in many respects an exceptional interest to the archæologist.

The mode of burial here employed was somewhat different from the one ordinarily met with in graves of the neolithic period. A ditch had been dug in the argillaceous marl, the bottom being a stratum of chalk subjacent to the marl, and the opening was covered with slabs of stone which we shall notice more particularly farther on. This ditch irregularly ovoid in shape had a length of thirteen feet four inches, and a least width of four feet eight inches.

Its depth was about twenty-two inches. It contained a number of bones heaped together without any order or arrangement, among which were found a cranium in a good state of preservation, some long bones, vertebræ, innominate bones, &c. With the bones were found various implements of flint, deer horn, and pottery, all of which are characteristic of the age of Polished Stone.

The articles of flint are not truly polished, but for the most part they bear evidence of careful reworking, which leaves no doubt as to their neolithic age. One of these is a beautiful flake in the shape of a blade, which measures nearly eleven inches in length by a little over two in greatest breadth, the edges of which are delicately worked into a number of saw-like prominces. A very finely worked arrowhead, some knives and some scrapers are also noticeable for their beauty. With these implements, which show no inconsiderable skill in the working of flint, were found a large number of others simply chipped, or at most bearing marks of very rude workmanship. But one stone implement was found which was truly polished; this is a small axe, not of flint, but of green stone, and hard enough to be a diorite. This little relic presents a very close resemblance to the ornaments which are so often found in the dolmens, with this difference that there is no hole drilled through the thick end. The implements of deer horn were few in number, and probably served as handles for tools, perhaps hammers; they are all perforated near the middle. The vases of pottery, of which some few were perfect, are not the least interesting of the objects here discovered. They were all placed in the ditch mouth downward. The material of which they are formed is good, and in the broken fragments nothing was seen of the *debris* of lime or of shells so often made use of in pottery of this period to give body to the mass of the clay. The manufacture of these articles, however, is altogether primitive, and it is certain that the potters wheel was not used. The surfaces both within and without are of a grayish brown color and they show none of the redness of clay vessels that have been more or less burnt; it is most probable that they were simply dried in the sun.

The vessels found at Brezé almost all show the imprint of fingers, the form is very coarse and the thickness of the walls irregular; there are none which show a true border about the aperture, or indeed, any ornamentation whatever. The most primitive are merely somewhat contracted below. No trace of the handles are seen in these and the form is scarcely symmetrical. Others are more graceful in form, the contraction at the base is well marked and near the upper part two or four small protuberances are seen, which can only be rudimentary handles, and which may have served to suspend the vase. On a third type of vessel, also without ornamentation, a large but very rudely formed handle is to be seen on one side. This last is an uncommon style of vase, and in shape reminds us somewhat of the soapstone lamps employed by the Esquimaux.

Such are briefly the different objects found in this grave. The implements of flint and of deer horn, as well as those of pottery, all show that the tomb at Brezé belongs to the earliest period of the neolithic age. These implements are certainly of great interest, for it is not often that such fine and large flint blades are found as the one mentioned above, and then too, the character of the pottery discovered here is quite rare. But this burial place is interesting on another account; we refer to the slabs of limestone which cover the grave, and which were mentioned above. These slabs are rough on the side which is in contact with the earth, which covers the tomb, but on the other which faces the objects contained in the excavation *they are worked*. The embellishment consists of rude drawing deeply engraved and representing figures more or less geometrical, as right angles, triangles, &c. Nothing similar so far as we know has hitherto been noticed.

Here then is a fresh discovery in regard to the early man which must be added to the others which have recently followed one another so rapidly in France. The existence of a numerous population, spread over the whole of France from the commencement of the age of Polished Stone cannot to-day be doubted, and the man of this period knew how to fashion, besides the implements of flint, the pottery of which we have just seen such rudimentary examples. If the man of the Neolithic Period at Brezé did not yet ornament his earthern vessels as he did a little later, he possessed none the less that artistic sentiment which we meet with among the most primitive peoples, as is shown by the stones which covered the sepulchre of which we have just spoken.

GAME PROTECTION.

NEW YORK.—Residents in the vicinity of Lake George complain that an immense amount of illegal fishing with spears, nets and grappling hooks is being done in the lake. We learn from the Sandy Hill *Herald* that an effort is to be made to bring the offenders to justice, the possession of the above implements by certain parties being notorious.

MASSACHUSETTS.—The members of the Worcester Sporting Club are doing good work in the preservation of quail. Strange to say they have brought the railroad to their assistance. The Worcester *Press* says: "It is noticed that the birds on the line of the Boston and Albany Railroad west of here have become so attached to Engineer Fenner that they have stationed themselves on the railroad bank and quietly waited for the coming of his train and the grain which was thrown from his cab window. In this way the club has fed four bevies of quail between here and Westboro, three between here and Rochdale, three in Shrewsbury and a number in the country about, and has been instrumental in preserving what promises to furnish game in plenty for the sportsmen next fall." The club is also prosecuting vigorously infractions of the game law, and several pot hunters have been stopped in their illegal killing of game.

—The sportsmen of Northampton, Mass., met on Thursday evening, Feb. 15th, and organized a club to be known as the Nonotuck Game Club, for the protection of fish and game in Hampshire county. The following officers were chosen: President, A. P. Peck; Vice Presidents, E. O. Damon and Gen. Otis; Secretary, G. W. Crittenden; Treasurer, Cushen L. Warren. The club has been organized under very favorable circumstances; it already has nearly 30 members. They will at once proceed to stock some of the most favorite ponds in the vicinity, and an effort will

be made to bring the ducks back to their old haunts on the Connecticut river by the planting of wild rice.

G. W. C.

—The Massachusetts Anglers' Association of Boston has called a meeting to consider the expediency of consolidating the various game associations of the State.

A Voice from Cape Cod.—A correspondent writing from Sandwich, Mass., relative to the inefficient game laws of that State says:—"I remember well the time I could take my old single gun, and on my father's farm in an hour, just before dark, shoot partridges enough to make a dinner for the family. Quail were also plenty in every grain field. A dog trained for birds was not to be found. Foxes were hunted and destroyed in every possible way but as soon as a game law was passed hunters were as plenty as birds, and although the shooting is quite good there now, it is almost an impossibility for any one without a dog to get any birds. I think the game law is a good advertisement for the Cape, at least, for who not acquainted there would think of finding anything worth shooting on that sand bank, for there are plenty of people who think it nothing but sand; well we do have game there and noble game too. No less than 300 deer have been shot in the last two seasons (our time is from the 1st of October until the 1st of December) some of them weighing 200 pounds, and most all found within a radius of twelve miles. Think of that, you sportsmen, who go 1,000 miles to find deer! I would like to know how it is that dealers can have game of all kinds for sale when the law does not permit a person to have in possession. Yesterday I passed through Boston market and saw deer, quail, partridges, prairie chickens and others kinds of game that I supposed were out of season, exposed for sale. Also in the streets near the market. They say it comes from the West, but I don't see as that helps the matter any. I think for one, that public opinion would do more to protect our game than all the laws we have or seem to have. S. N. W.

If we trusted to public opinion only there would soon be but few birds. We must have laws, but the secret lies in having them judiciously worded at first and most rigidly enforced afterwards.—Ed].

Connecticut—*February 10th.*—A most important bill is now before the Legislature of this State, which reads as follows: "That no person shall fish or hunt except on his own property, unless he pays the sum of $10 into the town treasury and receives from the Town Clerk a license which shall be good for one year." There is considerable opposition to this measure from a class of people who think it arbitrary and despotic, and there are some who say it is "a rich man's law to deprive the poor man of his sport." "Just as they do in the despotic countries of Europe," says another, &c., &c. Unthinking people they are who will grumble at and find fault with any law which protects game and makes it more plentiful, and consequently cheaper. The opposition above noticed does not come from sportsmen, for there are many poor, but true sportsmen, who would hail the passage of the bill with delight, and gladly pay for a license, and I believe that the man who is too poor to pay $10 a year for the right to shoot and fish, had better leave it alone. He is in my judgment too poor to lose a day's time from his work. I am a poor man, so I know how it is myself.

Under our present law it is almost impossible to prevent the killing of game, for the reason that our constables do not bother themselves about it, but if the proposed license bill be passed and become a law, we may depend on the activity of our officials; they will surely look out for their fees.

It will meet with favor from the farmers, as the license monies will go directly into the town treasury, thereby reducing rates of taxation. It will also put a decided stop to vagabond boys and idle men who may be found at all seasons prowling about with guns and fishing implements, and worse than all, the "sucker spear." In the early part of spring when the sucker ascends the streams, he finds the banks already lined with pot fishermen who armed with spear and lantern are ready for the fray. This business is carried on at night, and as the "sucker spearer" strikes at every fish within range of his spear, it is not an uncommon thing for him to spear two or three fine trout in a single evening, besides many which are injured but escape.

Now in a State where this business is so extensively carried on as here, one can well imagine how many trout are taken in this way every spring. I have seen trout weighing over a pound taken, as it was proved, in this villainous manner. I hope the present Legislature will pass the bill, and also empower every landowner to demand of persons hunting or fishing on his land to show a license. Then will be the time for sportsmen's clubs to organize and stock our field and streams with birds and fish. Von G.

Ohio.—The Cuvier Club of Cincinnati are determined to break up the unsuccessful sale of the quail markets of that city. To this effect the following resolutions were adopted at their last meeting:—

Whereas, It is now the close season for quail in Ohio and the contiguous States, and the presumption is strong that the possession of these birds now is unlawful; therefore be it

Resolved, That $500, or so much thereof as may be necessary to pay rewards, be appropriated to secure the conviction of any person or persons who may have in possession, or sell, or offer to sell, quail after the 8th day of Feb., 1877, and until the 15th day of Oct., 1877.

And yet in this State, where the law expires Jan. 1st, market dealers are allowed to sell quail until March 1st.

Pennsylvania.—The Sportsmen's Association of Western Pennsylvania, whose headquarters are at Pittsburgh, have some six hundred quails ready for putting out in that vicinity. A correspondent writes us regarding them as follows:—

"We were not quite as successful in keeping our birds alive after they had been taken as we should have desired; but a very large proportion were saved and placed in the country as noted. As yet we have not been able to surmise why a number of our quail perished. We had them in large and long flat cages; plenty to eat and drink, and altogether supposed they were about as well cared for in every way as it was possible for us to arrange, but in several of the cages large numbers of them died off.

The bill presented to the Legislature of the State relative to the prohibiting of hunting or fishing within the limit of the Commonwealth for ten years, has no prospect whatever of passing. An earnest protest was sent from this Association, and I think has had a telling effect.

J. D. L.

At the instance of the Forest and Stream Club of Scranton, Pa., a hunter, named Clarence Detrick, was arrested the other day for killing a deer at Pleasant Valley out of season. Mr. Detrick's venison cost him $33 50.

THE CASTELLANI COLLECTION.

ANTIQUE ORNAMENTS, GEMS, STATUARY AND POTTERY.

WHATEVER benefit the United States may hereafter reap from the Centennial Exhibition, one direct and very valuable result has already been reached in the quickened and intelligent interest in art which is everywhere making itself apparent. To gratify the rising taste and guide it to excellence, many artistic treasures have been added to the collections of our museums and institutions. Among these we shall be glad hereafter to number the Castellani collection of antiquities, and with that object in view would offer our testimony to its exceptional interest and great historical value.

The different groups of which it is composed, marbles, bronzes, terra-cottas, personal ornaments, engraved gems and majolica, have been arranged, and are now on exhibition in the picture gallery of the New York Metropolitan Museum. Signor Castellani has given the trustees the right of exhibition, with a privilege of ultimate purchase, and in order to attain the latter object an extra admission fee of twenty-five cents is charged. The sum thus accumulated will be paid into the purchase fund, should the trustees find means of obtaining the balance of the required amount—said to be $200,000.

The beginnings of such a collection are always of interest, and Signor Castellani thus describes the foundation of that which bears his name: "My father and I being jewellers in Rome, were greatly pleased with the designs of certain objects discovered in Etruria and Magna Græcia. We determined to reproduce those designs in modern workmanship, and for this purpose tried to get hold of some curiosities that suited us. This was the beginning of my collection of antiquities. I found it necessary not only to possess these curiosities, but to study them, because I was anxious not to mix up the Roman, the Etruscan and the Greek decorations, but to preserve the distinctive characteristics of each period." It was natural that, in view of the success attending his first efforts, the collector's aim should become broader, and that from gratifying the taste of the professional jeweller the collection should become the pride of the archæologist and connoisseur in ceramics. Years were spent in bringing together the several objects which make it one of the finest and most complete collections in existence. It is not to be wondered at, therefore, that it should have been highly appreciated in Europe. An attempt was made, but, fortunately for America, without success, to secure it for the British Museum. Mr. Charles Newton, of the Department of Antiquities in that institution, induced Signor Castellani to transport his treasures to England and exhibit them in the Museum. While there the greatest influence was brought to bear upon the Government to advance the purchase money—£40,000. The leading connoisseurs and journals were unanimous as to the importance of making so valuable an addition to the national collection, but the Government would not move, and the announcement that Signor Castellani was to visit Philadelphia was hailed by the British press with many hearty, but not the less amusing, regrets. After passing safely through such a danger, and escaping the omnivorous and wealthy collectors of England, it would be nothing short of a lasting reproach to the American public, if the Castellani collection should be allowed to return to Europe. Its purchase concerns the entire country rather than a particular city. The forms of beauty contained in it will teach our people to appreciate the beautiful, and foster a desire to be surrounded by objects reflective of refined taste. In thus singling out the educational advantages of such a possession, we leave its historical value to be estimated from what follows:

The marbles, of which there are twenty-three, are chiefly from Rome and Naples, and supply us with some magnificent illustrations of the perfection of Greek art. Very remarkable, alike by its size and excellence, is the colossal statue of Bacchus. The figure is that of a man, full bearded, and dressed in long and gracefully flowing robes, commanding in appearance, and singularly gentle in aspect. There is nothing suggestive of the "jolly god," the effeminate son of Jupiter and Semele, and to appreciate the sculptor's ideal, it is necessary to bear in mind that in the quaint and flowery confusion of Greek mythology the gods were occasionally duplicated, or rather, the same name was applied to several gods of essentially different characters. Cicero tells of five named Bacchus, and Diodorus of three, the first of whom, the Indian or "Bearded" Bacchus, is the subject of the statue. The story ran that accompanied by Pan, Silenus, the Satyrs and a frenzied army of men and women, he marched east and conquered India without bloodshed or battle, spreading the arts of peace and the science of husbandry as he passed. He was deified for his beneficence. Such is the being whom the unknown artist has tried to represent, and the success of his effort is commensurate with the elevation of his ideal. A head of the "Young Dionysus" represents the Bacchus whose worship was more general in ancient times, and, we may add, has been continued to the present day. The life-size figure of the Spinario would adorn any collection. It represents a boy trying to extract a thorn from his foot, and in the attitude and truth to details is the perfection of the realistic. Some of the heads are in an excellent state of preservation, and those historically connected with the later days of the Roman Empire will be viewed with deep interest. Among them are a head of Augustus, one of Tiberius, and one of Trajan, a limited gallery showing the best and the worst wearers of the imperial purple. Besides these there are busts of the Empress Manlia Scantilla, and of the Empress Julia Paola. The latter was the wife of Elagabalus or Heliogbalus, and thus recalls one of the most repulsive and eccentric occupants of the throne. Taking his surname from the deity in whose service he had been in Phœnicia, the youthful emperor soon proclaimed himself an advocate of the "rights of woman." To testify his sincerity he associated his mother and grandmother with him on the throne, and shortly afterwards married four wives, of whom Julia Paola was one. We look with more than curiosity upon the bust of a woman, whose husband, in addition to the above eccentricities, made his horse consul.

Among the bronzes the Prænestine cistæ or caskets are the first to attract attention. The use of these caskets was for a long time a matter of doubt, and to none is more credit due than to Signor Castellani for solving the mystery. They were at one time thought to pertain to the secret rites of the Eleusinia, held in honor of Ceres and Proserpine. Later discoveries, and chiefly those at Prænveste or Palestrina, proved that the cistæ were not dedicated to any such lofty purpose, but were used by the ladies of Etruria and Latium to hold the various articles necessary for the bath. Some have been found containing sponges, combs, hairpins, mirrors, strigils, and similar articles. They were, in fact, dressing cases, and were occasionally turned into that most miscellaneous of all receptacles, a lady's "work-basket." In shape the cistæ are generally cylindrical and very seldom oval. Their age is about two thousand years. The handles are unique, consisting of small figures placed in the center of the cover. In one we find a female acrobat, in others two figures wrestling or leaning against each other, and on some three figures are combined, two standing upright and supporting the third between them. On the bronze plating round the cistæ are delicate and beautifully executed engravings of subjects either historical or mythological. Number one of the catalogue is a deserving of special notice. It is oval in shape, and is engraved with a scene interpreted to be that where Æneas, having killed Turnus, king of the Rutuli, claims from Latinus the hand of his daughter Lavinia. The subject is familiar to readers of Virgil, but as this cistæ belongs to the third century before Christ, and Virgil was not born until about 70 B. C., it becomes evident that the poet drew upon the popular legend for materials for his great epic. Upon two of the cistæ Atalanta is represented, in one case preparing for the race, in the other at full speed and about to distance her competitor and suitor. Many of the articles found in the cistæ are also engraved, and show a great variety of theme and treatment. We can only call special attention to a bronze mirror case, in which Jupiter in the form of an eagle is represented carrying away Ganymede, the future cup bearer of the gods. The case is a splendid specimen of ancient *repousse* work.

The carved and engraved ivory and bone comprise thirty-eight pieces from Greece, Rome and Etruria, and among them are many very fine examples of an art-work which the ancients carried to great perfection. The personal ornaments illustrate the rise and fall of the art of working in gold, from the earliest period down to the thirteenth century. To refer to them in detail would, therefore, far exceed our present limits. Their bearing upon history would alone require extended treatment. Those from Etruria are chiefly valuable as showing beyond all question the eastern origin of the Etruscans. Their work and that of the Greeks show a knowledge of mechanical appliances to which modern artists are strangers. In design also they are singularly graceful, and assist in impressing us with the truth, that the primitive idea of beauty is generally the highest. The ornaments in the Castellani collection are from Etruria, Phœnicia, Lucania (showing the Italo-Greek style), Syria, Rome and Egypt, and furnish us with examples of Byzantine and early Christian art, from which we are brought down to that of the fifteenth and sixteenth centuries. An examination of the cameos and intaglios alone would be an education to an engraver of gems. One of the trays contains the toilet case of an ancient Roman lady. In those days it was called *mundus muliebris*, from a supposition that a woman's world was held in her dressing case. Among the articles are the lady's household gods, and mingling with these we find a silver gilt mask of Bacchus. The remaining articles are combs, dice, a paint box, hairpins, spoons, etc.

To the admirers of ceramic art the majolica and porcelain of the collection supply subjects for careful study. The word majolica or maiolica, as now frequently used, is synonymous with faience for the designation of glazed earthenware. Originally the word was only applied to the lustred wares resembling those imported into Italy from the island of Majorca, from which the name is derived. According to a later usage all Italian glazed earthenware was called majolica, and still more lately it was used to designate the wares made after the old Italian styles. Signor Castellani employs it in its medium sense to signify all glazed pottery of Italian origin, whether lustred or otherwise. The ceramic art of Italy is, to the student, exceptionally attractive. Through Italy the methods and ornamentations of the Orient became known to Europe. Although the Arabs settled in Spain in the eighth century, we have no relics of their pottery. In the thirteenth century the Moors drove out the Arabs, and left such monuments of their skill as the Hispano-Moresque wares in the Castellani collection. It is worthy of note, however, that very few pieces of this ware have been found in Spain. Nearly all the specimens now in museums, and private collections have been found in Italy, and the fact shows how highly the Italians valued the Hispano-Moresque pottery, and how close was the intercourse between the two countries. Instruction also reached Italy through the Saracens, who settled in Sicily in the ninth century, and their works, called Siculo-Moresque, are also represented in the Castellani collection. However far the Italians may have advanced independently of the influx of ideas through these two routes, the *renaissance* of Italian ceramic art is no doubt due to their influence. To Luca Della Robbia has been attributed the invention of tin enamel, a white opaque enamel which he applied very successfully to basso-rilievos. It is much more likely that he borrowed his knowledge of the process from the Saracens, who were undoubtedly in possession of it. Of that artist's works there are three in the Castellani collection, a baptismal font, a bas-relief of the Virgin and infant Saviour, and a bust of a veiled saint. Of these the second is the most characteristic. The figures are white—showing the tin enamel above mentioned—the sky blue and the grass green, the three colors to which Luca chiefly restricted himself. The other famous wares represented are those of Caffagi-

uolo, Siena, Gubbio, Castel Durante, Deruta, Faenza, Pesaro, Urbino, Rome and Castelli. The entire history of Italian pottery is thus illustrated in the collection. In point of priority of date we may call attention to the following:

First—Caffagiuolo. One of the pieces, consisting of a heraldic shield, bearing a black cock with *fleur de lis* in his beak, is dated 1466, or nine years previous to the oldest piece hitherto known, which is in the Cluny Museum of Paris.

Second—Deruta. A votive disc of this ware is thirty years older than any other piece known. It is dated 1505.

Third—Pesaro. The oldest piece from Pesaro is also in the collection.

Fourth—Rome. A pot dated 1597 is three years older than any other piece in existence.

These specimens will be sufficient to show that the Castellani majolica is not only fully representative of Italian art in pottery, but is historically of the greatest value.

Another rare feature of the collection is to be found in the two pieces of Florentine porcelain. Previous to Dr. Foresi's discovery that porcelain was made at Florence, it the latter part of the sixteenth century, Dr. Dwight's productions at Fulham, in England, nearly a hundred years later, were thought to be the first specimens of porcelain made in Europe. Both these wares were soft paste porcelain, and therefore not to be confounded with the kaolinic or hard paste, discovered by Bottcher at Meissen. One of Signor Castellani's pieces is probably the finest in existence. Dr. Foresi states that only twenty-five pieces of this Medicean or Florentine porcelain are in existence, and if to that number we add the two belonging to this collection, the ware is still of sufficient rarity to make a single specimen a most valuable acquisition.

SOUTH SIDE SPORTSMEN'S CLUB.—The South Side Sportsmen's Club of Islip, L. I., held its annual meeting Monday evening, at 63 East Fourteenth street. Vice President Charles Banks presided. The Treasurer's report showed the financial condition of the club to be exceedingly flattering. During the year past several of its bonds have been taken up, and there is now a large sum to its credit. The sports of the coming season promise to be excellent, all the fish preserves particularly being well stocked. The following officers were elected for the current year:—

President, John K. Hackett; Vice President, Charles Banks; Secretary, Roland Redmond; Treasurer, William M. Pliess; Counsel, John E. Develin; Executive Committee, Joseph Allen, Roland Redmond, John A. Lowery, and James Benkard.

The Kennel.

THE THREE BLIND MICE.—A very distinguished ornithologist and author contributes to the columns of *Rod and Gun* a letter with the above caption, which purposes to be a sermon to us and our contemporaries, the text of which is, "How sweet a thing it is for brethren to dwell in unity," etc. If there is one thing upon which we have prided ourselves more than another it is upon the fact that no unseemly wrangling has marred the smooth record of our pages, or disturbed the even tenor of our way. To be sure our young friend of the *Field* (Chicago) has, by his exuberant enterprise, on one occasion compelled us to address him in gentle tones of reproof; but on the whole the triumvirate which the distinguished ornithologist designates as the "three blind mice," have set a most excellent example of forbearance and brotherly esteem to their contemporaries generally. Nor do we see the application of the "mice" Those unfortunate rodents were brought into the world with their visual organs in an imperfect condition, hence their lack of perspicuity, which resulted in the loss of their caudal appendages. Now we claim to have been born with both eyes open, and with the ability to see as far through a stone wall as our neighbor. Let the D. O. bear this in mind, and as a token that we bear no malice we present him with a text which is a sermon in itself, viz.: "He that hath eyes to see, let him see; and he that hath ears to hear, let him hear."

TAX ON DOGS.—Mr. Thatcher, of Pettis, has introduced a bill in the Missouri Legislature, providing for the taxation of dogs, as follows: The first dog owned by any individual to be taxed $1, the second dog $2, the third $4, and every dog over that number $5 each. All bitches to be taxed $5 each, and the owners of dogs to be liable for any sheep destroyed by them. Persons are allowed twenty-five cents each for killing unlicensed dogs.

—A Toronto man lost a valuable spaniel on January 3d, and though liberal rewards were offered, nothing could be heard of it. On Saturday week the children of the family went into an empty house near by to play, and found the dog shut up in a back room and just alive. It was then remembered that the children were playing in that house on the day the dog was missed, and for 33 days the poor animal was imprisoned, without food or drink. Though mere skin and bones when found, he was very fat when shut up, and to this fact he probably owes his ability to live so long.

—Mr. Geo. E. Poyner, of Clinton, Iowa, writes us that his Irish Gordon bitch Fan (formerly E. F. Stoddard's) has visited Arnold Burges's red Irish setter Rufus. This is the third time Fan has been served by Rufus, and the puppies have turned out very handsome and remarkable field animals. Fan's pedigree is the bluest of the blue. On the Irish side she traces back to Hutchinson's Bob, and on the Gordon to Bolingbrook's Argyle and Stokes's Moll and Shot.

—The name claimed for Mr. S. B. Dilly's Ranger-Fan puppy should be "Fleet" instead of "Flirt," as printed. Mr. Dilly says, and perhaps some of our readers may agree with him, that there are too many *flirts* already.

—Mr. Henry S. Zell's Queen, and Mr. L. R. Cassard's Maggie, all of Baltimore, visited Mr. Jerome Marble's Grouse at Worcester last week. Mr. Tileston's Lou is now on a visit to the same dog. Mr. George S. Thompson's (of Foxboro, Mass.) Bess has just whelped eight puppies, 5 dogs and 3 gyps, sired by Grouse. Mr. Thompson says they are all perfect specimens of the black and tan Gordon.

—Mr. J. Addison Smith, of Baltimore, writes us that his lemon and white pointer Lilly, purchased by him of Mr. E. C. Sterling of the St. Louis Kennel Club, whelped on the 15th inst., five puppies, three dogs and two gyps, all white with lemon markings, and sired by the Westminister Kennel Club's imported dog Sensation.

—Mr. Frank J. Snyder's (of Pittsburgh) setter Nell whelped, on the 15th inst., seven puppies, four dogs and three gyps, white, and lemon and white, by Mr. John Smith's Rock.

—Mr. Alex. Pope, Jr.'s, (of Dorchester, Mass.,) fine Gordon setter Jule, whose portrait we recently published, whelped on the 16th inst., eight puppies, seven dogs and one gyp, by Copeland's (late Jerome's) Shot.

ARECA NUT VERSUS SANTONINE.

EDITOR FOREST AND STREAM:—

The relative efficacy and safety of the two anthelmintics above mentioned make the subject of their consideration one of deep interest to every reader of the FOREST AND STREAM since it is to be supposed that nearly every reader is, or ought to be, the owner of a dog in which he takes all the pride of a true sportsman. The authority of the gentleman who had the honor to be your Kennel Editor for several years was such as I have always had great respect for from the fact that he had a long and varied experience in kennel matters, but the enthusiasm with which he viewed the virtues and efficacy of areca nut as a vermifuge for dogs my observations entirely fail to endorse.

The areca nut is the product of the "areca catechu" or "betel nut tree," and belongs to the family of palms and is cultivated in East India chiefly for the purpose of obtaining the nuts to manufacture their popular masticatory—the "East India man's tobacco"—which is used in immense quantities.

This is made by mixing the powdered areca nut with a little lime and the leaves of the piper betel—a tree of an allied species. The leaves form the body or mass of the cud and serve to protect the lips and tongue from the too sharp and even cauterizing effect of the quick lime. The chewer becomes quite expert in placing the wad in his mouth, and the flow of saliva occasioned thereby is very copious, and is of a red color. This red color is owing to the areca nut and it is, when swallowed, imparted also to the excrement of the chewer its effects upon the system are that of an astringent when used in this way and tends to counteract the relaxation of the bowels to which the heat of the climate so strongly predisposes. Hence it will be observed that the East Indian is practically taking this vermifuge all the time, but it does not follow that the same persons enjoy immunity from the presence of worms in their bowels; quite the contrary some of the most remarkable instances of intestinal worms have been known in the inhabitants of the eastern countries where the betel is used—the name by which this masticatory is known to the natives,

As a vermifuge for dogs we know of the areca or betel nut, in powder, to be of a brownish yellow color, of a somewhat astringent, followed by an acrid taste, and upon analysis it is found to abound in the most active vegetable astringents, viz.: tannin and gallic acid, a fixed oil, a little volatile oil, and a gummy and woody substance.

Having taken some of the powder in my mouth from a box on my desk before me while I write, and noting the taste as above I find that upon swallowing some of it I have a sense of nausea following with a decided sense of astringency upon the tongue and throat. This explains to me the cause of the fact of my dogs having vomited the powder so promptly on different occasions when I had administered it to them for worms. This disagreeable and prostrating effect led me to abandon the use of it as an anthelumintic for dogs. Upon one occasion I became somewhat alarmed for the safety of a favorite dog to whom I had administered it, and my mind was only relieved when the drug—a dose of twenty grains—was ejected by the animal; the symptoms of distress and prostration were shown in labored breathing, distressed continuance and violent retching.

With reference to the effect of areca nut upon the dog, in point of safety, I do not assert that it is dangerous in ordinary doses, but my observation has been that it is depressing and liable to produce vomiting and other symptoms of prostration, and while there are other remedies at hand that are positively mild in their action and entirely effective in their results I certainly advocate their use instead, and I may be pardoned if on behalf of the comfort alone of the faithful dog, the use of which in the field is the chief incentive I have for the sports thereof, and my fondness for him under all circumstances of his good behavior makes me his friend, and I love to study his disposition, his anatomy and the physiological action of his organs, and what is most efficient and pleasant for him when sick; and to this end, Mr. Editor, I encroach upon your valuable space to advocate the use of santonine as a vermifuge as being more eligible than areca nut for the several reasons, to wit:—First—Its unfailing efficiency. Second—Its entire safety. Third—Its palatable taste.

Santonine is the active principle obtained from the unexpanded flowers and peduncles of *Artemesia contra*, a plant which grows in Persia, Asia Minor and other parts of the East. It is crystallizable and is usually found in the shops, when pure, in colorless crystals which have the form of flattened rhombic prisms. It is inodorous, and at first tasteless, but after a little time slightly bitter, but not at all unpleasant.

CHAMPION POINTER BITCH, BELLE.

BELLE.—The growing interest in pointers is our reason for re-publishing one of the earliest illustrations which appeared in our paper. Belle, in her day, was the champion field trial dog of the world, being winner of the one hundred guineas stakes at Balas Grouse Trials, 1873, beating Mr. Llewellen's "Countess," Mr. Stattor's "Rob Roy," Mr. Macdonna's "Ranger," and all setters and pointers in England. Belle is a liver and white bitch, pupped June 28th, 1870, by Lord Henry Bentick's Ranger out of his dog Grouse. Winner with Sudy (No. 3) of the Bangor Stakes for Pointer Braces, and of the Country Stakes for all aged bitches at Vanol Field Trials, 1872; and with Grecian Bend (No. 4), of the Acton Reynold Stakes for pointer braces, and of the County Stakes for aged pointer bitches, at the National Pointers and Setters Field Trials held at Comber mere, near Shrewsbury, April 29th, 1873. Also at the Grouse Field Trials, 1873. Second with Roman Fall (No. 5) in the Penllyn Stakes for Braces, August 13th, 1873. She was first in the Rhiwlas Stakes for all aged pointers and setters, beating Mr. Macdonna's Ranger, Mr. Llewellen's Countess and Flax, Mr. Stattor's Rob Roy, and other celebrated performers.

—Mr. Avery W. Gore, of Cambridgeport, claims the the name of Fred for a white black and tan puppy by Rink out of Mollie (her dam St. Kilda), whelped December 8th, 1876, and bred by Isaac Fiske, of Worcester, Massachusetts.

BEAGLES.—Messrs. Waddell & Sherwood advertise a pair of fine beagles in this issue of our paper. Portraits of these dogs can be seen at our office.

ETHAN ALLIN'S DOGS.—A correspondent sends us the following letter dated Ayer, Mass., Feb. 15th: "I saw a notice in your paper from Mr. Ethan Allin, Pomfret Centre, Conn., stating that his gyps Chum and Cosey, had each a litter of puppies. Now I will say to any person wishing to buy a good dog, that they will find Mr. Allin a very honest, fair, and square man, and his breed of dogs as good as any in this country." J. W. KITTRIDGE.

—Mr. F. B. Farnsworth, of Paris, Ontario, writes us that he has sold the last litter of whelps out of his imported field trial bitch Rose by his imported Laverack dog Carlowitz, to the following named gentlemen: Blue belton bitch Forest Rose, to J. H. Caniff, Detroit, Mich.; white bitch ticked with chestnut, Countess, to E. Bennett, Dexter, Mich.; lemon belton dog Frank, to A. C. Rogers, Detroit, Mich.; white and chestnut bitch Guess, to Fred Stearns, Detroit, Mich.; white with chestnut ears, bitch Wynne, to J. N. Dodge, Detroit, Mich.; white dog Bute, he retains himself.

Santonine is only soluble in the intestines when it comes in contact with the soda in the bile there found, forming the santonate of soda; it then acts by poisoning the worms *after* its solubility, but has no effect in the acids of the stomach, hence its action, unlike the areca nut, is mild upon that organ. It is in fact a vermifuge that does not irritate the stomach or disturb the functions, but is carried in an innocuous state to that point in the alimentary canal where it meets its potentizing element—the soda of the bile—and then consecutively the parasites upon which it is to act. And it does then act surely and unfailingly. So much for my first proposition; now the second:—

Of the entire safety of this drug, I must say, with all due respect to your quotation from the "Druggists Circular," Mr. Editor, I would rather take the experience of one active, busy practitioner of medicine, who was an intelligent and faithful observer of the action of this drug on the animal system than the alleged single report of a single case from a "German paper," and I think you will in this point agree with me at least. Permit me to give you a single example of the entire safety of the drug in large quantities. I could give you several, but this one is illustrative of the assurance of the medical profession who are probably qualified to judge that santonine is safe in any quantity in which it is likely to be administered.

Case—At a professional visit to the head of a family my attention was called to a boy five years old. Upon gaining a history of his symptoms, among which was the passage of a round worm, I ordered by prescription twenty grains of santonine, to be made into twelve powders, one to be given to the boy night and morning, fasting; the last powder to be immediately followed by a large dose of castor oil. At my visit the day following I immediately asked if the boy had taken a powder "this morning?" "Yes," answered the mother, "I gave it to him, but there was only one in the box." Asking for the child to be presented to me, he was sought by the nurse, who brought him in a few minutes from his little playmates in a neighboring street, and he was kicking, scratching, crying, and the truth I should add, swearing in a most robust manner for one of his years. He was brought before me sullen and bursting with rage, a large piece of bread and butter in one hand and a stick of candy in the other, the little pockets of his apron distended with peanuts. "How are you my boy?" said I, as my anxiety calmed somewhat. "I'm well; I want to go and play," he answered, as he drew from me and started down stairs *en route* to his companions. The child, by mistake of the druggist, had taken at one dose twenty grains of santonine twenty-four hours before instead of a fraction less than two grains, the dose intended for him, and had exhibited not an untoward symptom. The night following he passed the large round worms. Comment is unnecessary.

I will state that the only case of poisoning ascribed to santonine that I have been able to find in medical literature was reported in the "Chemical News" No. 230, page 212, and in this case it was ascertained to be owing to strychnia mixed with it.

Santonine has a tendency to discolor the urine by rendering it yellowish green, and this simple fact is often a source of unnecessary alarm. Concerning my third and last proposition I can only say that so far as regards the taste of the drug it has little or none, and can be administered as follows with entire safety and assurance of success. To a setter of ordinary size give two grains of santonine night and morning daily, feeding the dog lightly in the middle of the day only. At the end of the fifth day give him a large dose of castor oil; if there is any suspicion that all the worms are not removed by this one course repeat it in a similar manner, and that by this plan they will all be brought to light in a condition in which they will be scarcely fit to enjoy it is the earnest assurance of SOUTH FORK.

P. S. Having oftentimes been unable to decipher my own writing when it had grown cold, after being hurriedly written, I do not consequently hold your typos altogether responsible for one or two errors in my last communication, published in issue of February 15th, 1877, but would ask that the following corrections be made: In next to the last line, first paragraph, read "an *adynamic* form of distemper."

In first line of second paragraph read "The presence of worms was a concomitant and their expulsion partly the result of, etc."

In third line, second paragraph, read "Due to their own poisoned and relaxed state." S. F.

DISTEMPER IN DOGS.—I send for the benefit of your readers, Henry William Herbert's receipt for distemper in dogs, also my experience, assuring those who will follow it up a successful treatment for this prevailing disease. The writer has tried it to his satisfaction for fifteen years, and his father since 1838, at which time "Frank Forrester," who was stopping with him at Bristol, Pa., gave the right to him. As soon as their is any indication of distemper, such as running at the nose or eyes, procure a small bottle of spirits of turpentine, and with a feather apply it twice a day across the bridge of the nose. Its effects will be seen immediately in the dogs sneezing and throwing the discharge out, also using his tongue. I have raised hundreds of puppies and never had one die of this disease, or known it to leave any bad effects. I do not contend that it will cure bad cases, but that it will prevent the case from becoming bad; the dog will have but a slight attack. Let some of your readers try it, keeping their dogs in a warm place and free from wet. The result will be as described. B.

CONTINENTAL RAPID TRANSIT.—Seven carloads of teas and silks from Japan reached New York on Wednesday, via the Baltimore & Ohio Railroad, making thirteen days' time from San Francisco to New York, which is believed to be the best time ever made by freight trains. The time from Yokohama to New York was thirty-four days.

—The Clerk of the Fishery Committee of the Massachusetts House of Representatives told the following to his Committee as his experience in fishing: Allusion was made to catching large fish, when he asserted himself as the champion catcher, having caught the largest fish off Scituate, a bass of one hundred and thirty pounds weight. On inquiry as to what kind of baits he used, he said D. G. Bates, he having married a lady by the name of Bass.

Rifle.

WHAT THE RIFLEMEN ARE DOING.

Yale may go west. He does not think he will shoot to any extent this year.

Farwell will shoot, but not half as much as he did last season.

Gildersleeve has bought a hunting dog. If he hunts as well as he shoots game will be scarce. The Judge will show his marksmanship at Creedmoor once in a while.

"Old Reliable" (Bodine) has been testing his $400 Greener. He shoots the shot gun as well as he does the long-range rifle.

Dakin has been experimenting a little this winter with good results. He intends to "head the list" shooting next season.

Allen has visited the range several times this winter. He will be a steady patron of Creedmoor when the "fun" commences.

Rathbone, the "best man" on the team in the Centennial match, will try to be (with a good show of success) in the same position on the next team.

Weber has been shooting from the 1,000 yards' firing point several times during the past two months. He will be on hand when the time comes.

C. E. Blydenburg will go to Creedmoor "once in a while," but may not be a steady competitor.

Hayes, the expert off-hand shot, is getting ready to show his skill at long-range shooting.

Fisher has been using his muzzle-loader this winter, and expects to "raise the dust" during the approaching season.

It is reported on good foundation that a party is making preparations for the building of a rifle range within thirty minutes' journey from the City Hall. The location is both convenient and pleasant.

There will be many beginners at long range shooting this year. "Success to them."

The new regulation targets at Wimbledon are thought to be well enough when the lying down position is used in 200 yards shooting, which is allowable on that range, but when off-hand work is only permitted at this short distance, as is the case with the ranges in this country, the six-inch bullseye is too small.

There is some talk of starting a line of stages from Hunter's Point to Creedmoor. They will make better time, and the fare will be less than that of the unaccommodating railroad which has hindered the growth of the most popular range in the country to no small extent. The leading topic with the long-range riflemen is in regard to the sending of a team to Wimbledon.

THE NEXT INTERNATIONAL MATCH.—Mr. George S. Schermerhorn, Secretary of the National Rifle Association, has received the following letter from Col. Macdonald, late Captain of the Scotch Rifle Team, in answer to a communication from Mr. Schermerhorn in regard to the coming rifle match:—

EDINBURGH, 15 ABERCROMBY PLACE,
February 1, 1877.

MY DEAR SIR:—I duly received your letter and copy of resolution of your board. It is very kind of the donors of the international trophy to consult those who competed, and the only desire we have had in considering what to recommend has been to promote the permanence and efficiency of the great match. I annex a note of the recommendations unanimously adopted by the council of our National Club. As regards the first, we are all very strongly of opinion that the future of the match as a gathering of several nationalities (without which it would loose much éclat) can only be insured by not holding it too often, looking to the enormous distance to be traveled, and the very great expense involved. All the other suggestions are of minor consequence in my personal opinion, though they might add to general satisfaction already felt with the conduct of the match by your people. Begging you to give my kind regards to my friends who meet at your board, believe me, yours very truly,

(Signed) J. H. A. MACDONALD.

P. S.—I suppose we may now hold that there will be no attempt to supersede the separate nationalities of a British team. If such is made by any of our English friends, I hope it will be understood in America that we object to the right of a British team to shoot now, after conclusions have been joined by your nation with our Scotch nation as a separate nationality in rifle shooting matters.

To Geo. S. Schermerhorn, Jr., Secretary National Rifle Association, New York.

RECOMMENDATIONS.

1. That the match take place triennially instead of annually.
2. That if possible the match be held upon neutral range, strange to all the teams.
3. That the range should be open for preliminary practice for fourteen days previous to the match.
4. That previous to the commencement of the preliminary practice the targets should be balloted for, and that the targets so obtained should be held during the practice and the match itself.
5. That the divisions on the targets should be cut out, and not merely painted, so as to facilitate the decision of disputed shots.

These recommendations will be duly considered and discussed at the next meeting of the N. R. A. Mr. Macdonald's suggestion as to a British team not being allowed to shoot in the place of representative national teams, would indicate an improbability of our soon seeing English riflemen at Creedmoor; as the rifle authorities on the other side are not likely soon to recede from the position taken last year, which was that only an Imperial team should be sent to contest in the international matches.

THE IRISH RETURN MATCH.—The President of the Amateur Rifle Club, last week received the following letter, suggesting a return match on Irish soil to that which occurred at Creedmoor immediately after the international match of last summer—being the third of the series. A meeting of the club will be at once called, when the matter will be discussed:—

DUBLIN, 49 RUTLAND SQUARE,
Saturday, February 3, 1877.

MY DEAR SIR:—I have pleasure in submitting to you the following resolution passed at a council meeting of the Irish Rifle Association, held at the Mansion House, Dublin, on the 22d ultimo, the Right Hon. the Lord Mayor in the chair:

That an invitation be addressed to the Amateur Rifle Club of New York to send a team to Ireland in the present year, to shoot a match on same conditions as Irish-American matches of 1874, 1875 and 1876.

I have peculiar pleasure in forwarding this resolution, and I hope it will lead to another of those friendly contests which have in the last three years been productive of much good feeling and honorable rivalry between two nationalities connected otherwise by many agreeable associations. The month of June is suggested as the most suitable for this match, as it will enable those gentlemen whom we hope to welcome as your representatives to take part in the annual competition of the Irish Rifle Association, and subsequently to visit the camp of the National Rifle Association at Wimbledon.

I am, dear sir, your very faithful and sincere friend,
ARTHUR B. LEECH.

CANADA.—A rifle match took place at Fisherville, Ont., on the 8th inst., between the clubs of Fisherville, Selkirk and South Cayuga, resulting in favor of the Selkirk team, as will be seen by the following scores. The conditions were muzzle rest; range 100 yards; target, Homer Fisher's 100-yard paper target; weather favorable; wind southwest. The three teams met on the range at 1 o'clock, and made the following scores. The prizes contested for were a prize of $6 for the best score from any team, and a special prize of $1 for the best individual score. Six shots for each member of each club:—

SELKIRK RIFLE CLUB.

Name.	Total.	Name.	Total.
Wm. Saunders, Capt.	25	J. Bayer	28
Ben. Bayer	18	J. Armstrong	26
Geo. Slade	23		
J. Smith	21	Total	143

Each member of this team used a Smith & Wesson rifle.

FISHERVILLE AMATEUR RIFLE CLUB.

Name.	Total	Name	Total.
Geo. Nabbo, Capt.	27	Geo. Held	25
J. W. Holmes	17	N. F. Finch	16
John Otterman	23		
P. Nabbo	25	Total	138

Three of the above used Maynard rifles, and three used Sharps'.

SOUTH CAYUGA RIFLE CLUB.

Name.	Total	Name.	Total.
A. Cockle, Capt.	21	J. Fathers	13
J. Wismer	15	D. Dashwood	23
O. Fathers	9		
Wm. Wismer	19	Total	100

All of these used muzzle-loading rifles.

The prizes were paid to the winners on the range. After which all repaired to Mr. H. Kemp's hotel for supper, which was bountifully supplied at 6:30 p. m. A return match will likely come off at Selkirk on the 20th of May if all goes right. B. M. S.

SHOOTING EXTRAORDINARY.—We would suggest to members of the Amateur and other rifles clubs *not* to read the latest installment of Rev. W. H. H. Murray's Adirondack story in his paper, the "Golden Rule," unless they wish to have their conceit as marksmen entirely destroyed. For here we read of the "Old Trapper" (a weak imitation of Cooper's Leatherstocking with style and mode of speech accurately copied) and his companion performing not only the same feats ascribed to Natty Bumpo, but others much more marvelous; such for instance as cutting the wires and uncorking champagne bottles, and driving *tacks* at fifty yards; killing partridges on the wing and splitting potatoes tossed in the air. And all these wonderful things were done with *double rifles* with "open" and "globe and bead" sights *by Lewis of Troy*, and Mr. Murray is careful to tell us in a foot note that "there are none of the shots described which the author has not seen made." But then Mr. Murray has seen some wonderful things in the Adirondacks, ghosts included.

SOUTHERN VS. NORTHERN RIFLEMEN.

QUALITIES AND ACCURACY.

EDITOR FOREST AND STREAM:—

As you seem to favor liberty of expression and opinion, I inclose a few remarks:—

I must confess that the impression I received from reading "Howcolah's" letter, corresponds with that expressed by G. G. R., of Vermont, in a measure. Now, I have no prejudice for or against the southerner, as I have hunted *for* him and been hunted *by* him, and we have hunted together, slept together, eaten together, camped together, and last, though not least, have drank from the same canteen.

During a stay of seven months in the south—1875 and 1876—I came across a native armed with a muzzle-loading rifle (barrel at least three and one-half feet long), with which he proposed to beat my twenty-eight inch Wesson at one hundred yards, off hand; but he didn't, and I do not call myself much of a shootist either, having at that time owned a rifle three months only.

The generality of southern people I have met, class all as Yankees who originate (in the United States) north of the former so called slave States, and I will venture to assert that any number of riflemen can be selected in that territory who will compare favorably with the same "Howcolah" may select in Dixies land. Whatever was the status in regard to this matter one hundred years ago, may *possibly* have nothing to do with the habitat of the most expert marksmen of *to-day*. O'VERICUS.

MILEY'S GALLERY (BROOKLYN).—The following are the best targets made at this gallery last week, ten shots each. This match closes to-day:—

Name.	Total.	Name.	Total.
Chas. H. John	46	Henry Stanton	45
J. G. Ringsley	46	P. J. McGhee	43
J. F. Burns	45	Geo. Gleudenning	40
J. W. Wallis	45	E. B. Castner	40

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

MASSACHUSETTS.—The fourth shoot of the Border City Gun Club took place in Fall River, Mass., on February 14th. The birds were very strong flyers. The lot not being very large would not permit of but 40 yards boundary, and many birds not scored were killed out of bounds. The following is the score, six birds each:—

Name.	Total.	Name.	Total.
J. J. Farwell	4	Daniel H. Golden	4
Wm. N. Arnzen	3	Wm. B. Durfee, Jr.	1
Alvin C. Seymour	0		

At the end of the match J. J. Farwell and Daniel H. Golden were tie, which was shot off at three birds apiece with the following result:—

Name.	Total.	Name.	Total.
J. J. Farwell 1 1 0	2	Daniel H. Golden 1 1 *	2

There not being birds enough the tie will be decided at the beginning of the next match. GUNNER.

NEW YORK.—Please find an international trap-shoot between Messrs. A. Grubb, John Woodruff and Geo. Rogers, of St. Catherines, Canada, and R. O. Fulton, S. T. Murray and J. M. Witmer, of Niagara Falls, held at Clifton, Canada, Thursday, 15th. The judges were H. Fulton, for Americans, and George Reilly, for Canadians; D. Isaacs, referee. The match was for $60 a side, ground traps, Canada rules. The day was very cold and windy. The following are the scores:—

Name.	Score.	Total.
A. Grubb	1 0 1 0 1 1 1 0 1 1 1 1 1 1 1 0	11
R. O. Fulton	1 1 1 0 0 1 0 1 0 1 0 0 0 1 1	8
John Woodruff	1 1 1 0 0 1 1 1 0 0 1 0 1 0 0	8
S. T. Murray	1 1 0 1 1 1 0 1 1 0 0 1 1 1 1	11
Geo. Rogers	1 1 1 1 0 1 1 1 1 1 0 1 0 1 1	12
J. M. Witmer	1 1 1 1 0 0 1 0 1 1 1 1 1 1 0	21

Total for St. Catherines, 31; total for Niagara Falls, 30.
C. S. R

NEW JERSEY.—*Kinsey's Ashley House, Barnegat Inlet, February 17th.*—One party killed seven geese and four brant yesterday on the Clam Island. Plenty of fowl, but no tides to do much execution. B.

PENNSYLVANIA—*Bedford, Feb.* 13.—Turkeys and quail are very plentiful in this county. Some of the quail have perished this winter, but we have lots of them left. Last fall we could put up ten to fifteen bevies in one day without any trouble. I have killed fourteen turkeys the past season; sent some weighing from 18 to 19½ pounds to friends in Philadelphia. In hunting wild turkeys here with success you must have a dog to scatter them; then call them up, provided you can. I have the best turkey caller out; can call up an old gobler as easily as a young bird; its very simple and can be made in five minutes.
WM. MCM.

—An old Maine correspondent who has just arrived in California, writes us from San Francisco, Jan. 23d:—

"I have had two or three duck hunts since my arrival, but can do little without a retriever, although they swarm in countless thousands within ten miles of the city."

One memorandum he made in crossing the continent which is worth noting. Perhaps our readers will cut it out and act upon the suggestion. It will save us answering many questions:—

"The flocks of geese, ducks and prairie chickens that flew out of the immense cornfields of Iowa and the Platte valley fairly made one wild. One who has passed his many years in the Northern and Eastern States can have no conception of the numbers of wild fowl that inhabit those regions, as well as this coast."

The good old fellow winds up by saying:—

"Allow me to congratulate you on the improved appearance of your paper. It is all that any intelligent sportsman or gentleman can desire."

FOREIGN AND AMERICAN GUNS.

EDITOR FOREST AND STREAM:—

Your belligerent correspondent Mr. Hepburn takes me to task for expressing my judgment of the merits of foreign gunmakers, and abuses you, Mr. Editor, because I have said nothing about American guns. My intention was to write an article on the American exhibit at the Centennial, and to give my candid opinion of the merits and demerits of our home productions, but the tone of Mr. Hepburn's communication may well deter one from making any allusion to home industry. A maker of guns who is so sensitive as to abuse one for commending foreign perfections, especially when such perfections are not contrasted with home productions, can hardly be worthy of notice. The Remington is good enough for the price, but who can expect to get much of a gun for $45? Why a 10 gauge of this make should simply be a 12 in size externally but bored two sizes larger, I can understand on the score of cheapness, but why such especial pains should be taken to destroy all beauty and symmetry, when graceful curves and outlines cost no more than homely ones I cannot discover a reason.

These guns are made as muskets are at Springfield, by machinery, and can be turned out with the same rapidity, and are highly creditable productions for the little money charged; but this fact does not give Mr. Hepburn a right to abuse one who prefers to pay $300 or $400 for a superior weapon. Shall we banish our Purdys, Henrys and Scotts, and embrace a Remington simply because it is an American production and the price is $45? If so, why stop at these figures? Guns that will burn powder and propel shot are made for less money; are we doing a wrong to home industry by not using them? Forty-five dollars is the magic sum, and nothing below or above will answer. According to this gentleman's theory the leveling must all be down to his standard, and not up to a higher. I have already said more than the importance of this matter demands, and willingly pass on.

The best exhibit of cheap guns—that is, guns of less value than $100—was by Parker, of Meriden. My opinion is formed after dissecting the action and examining in detail every part under a powerful glass, and I am satisfied that the improved action, the good quality of the Belgium barrels, and the evident honest intention of making a good sound gun, entitle them to the first rank as makers of this class of weapon. Why they do not adopt the Purdy action with the top lever, is a question they can no doubt answer satisfactorily; but to an outsider it seems strange to see convenience and adaptability thus rejected. As an American I feel proud of their productions, and hope they will not stop in the march of improvement, but steadily press onward and upward. By using the Purdy action and lighter barrels; by copying Scott's style of stocking and balancing, they can make a wonderful improvement in their weapons. Beauty is an essential element of utility, and no one can afford to deny its claims. Clark & Snyder's best gun (price $300) was a beautiful piece of work. The materials were fine, and the filing and fitting would compare favorably with the best English work. The rebounding locks had some features of decided improvement, and if use confirms the theory, will prove a valuable gain in this most important part of the gun. From the amount of skilled labor bestowed on this weapon I do not imagine Clark & Snyder could make their fortunes on this quality of guns; but as an exhibit of what American labor and skill can produce, it was most gratifying. John Krider's gun at $200 was a good, sound piece of work, and a credit to any maker, as was also an 8 gauge ducking gun at $125. Both were entitled to commendation.

To change the subject. I have been one of the numerous victims of Greener's last literary effusion, having invested $3 50 in "Choke Bore Guns, and How to Load Them." This book is a rehash of his "Breech-Loading Guns," swelled with newspaper puffs of his own wonderful productions, the *Field* trial and others, of not the slightest interest. The *Field* trial has been sown broadcast over the land, and is familiar to all. It settled nothing, except as to the guns actually engaged, and hardly that, as the same conditions were not applied to all. That a gun bored to concentrate the charge at the muzzle will show a better pattern than a cylinder, or a relief, was an undisputed fact, the extent of the improvement being different in every gun. A system of boring by which all guns can be made to shoot equally well has not yet been discovered, and neither Greener or any other maker can produce absolute uniformity. The first edition of his book told us that we could hardly get gunpowder with coarse enough grain, and that we should use five or more drachms. This edition says that a prize powder of the size of Curtis & Harvey's No. 4 is the correct thing to produce perfection in shooting, and will develop the highest powers of his guns. Whether the same magnificent results would be produced in Scott's "Premier" he does not say, and probably would not admit, as he claims a perfection and certainty for *his* system of boring unattainable by any other maker. According to this book the entire wisdom and skill of London and Birmingham is centered in St. Mary's Works, and is not allowed to stray outside. To a person unacquainted with gun literature the perusal of this book would leave but one impression, and that would be, that but one man can make a choke-bored gun, and that man is W. W. Greener. The 30-inch diagrams, unaccompanied as they are by any evidence that such shots were actually made at the distance and with the charges specified, are worthless, and sportsmen will require something better than mere assertion before they invest their money. That Greener can make good guns I know, having owned and used them; but that he is uniformly reliable and *always* sends out perfect weapons, I deny, and am strongly impressed with the conviction that less assertion and better production will improve his reputation in this country.
FORTY-FIVE.

[In justice to Mr. Hepburn we must say that his letter was written without any reference whatever to the Remington gun, and solely in his capacity of private individual, and not as an employe of that firm.—ED.]

DUCKING ON THE POTOMAC.

OSWEGO, N. Y., February 16th, 1877.

EDITOR FOREST AND STREAM:—

Your Washington correspondent's) letter of this week was read with pleasure, as it brought to mind a part of my trip south last February, and the names of two gentlemen members of Mt. Vernon Ducking Club, Messrs. Kuehling & Bartlett, who kindly took me down the Potomac to their club house, where we spent a few days of real enjoyment duck shooting from batteries and blinds. The Club have everything in good shape, plenty of decoys, boats, etc. A fine bough house has been placed out in the middle of the river, which for convenience and comfort can't be excelled. With decoys put about it in good shape, and ducks fairly plenty, I can't conceive of better sport and greater comfort while duck shooting with success. Many is the poor duck that has made his last dart at and about that bush. Mr. K. did good work from his battery stationed a few rods from shore. Ducks would almost settle down upon him so well was his battery made to deceive them.

The most amusing part of all was to see my friend B. prepare breakfast, with half a dozen hungry setter dogs to manage and keep out of the pots and kettles on those occasions. He has a smooth temper and certainly loves a good dog, for they had it about their own way, still we fared well, as he is a host in that line.

As our steamer neared Washington on our return, I could hear the boom! boom! and see the smoke clear away from a battery surrounded by decoys only about one hundred rods off the foot of Seventh street. With the aid of a glass I could see some one raise up and bang away every few moments from among those stools, and then all would be quiet again, and then the duck would catch it in quick succession. Later that day I learned that the shooter was Dr. W., of Washington, and that he had brought home one hundred and forty-seven canvas backs, shufflers, etc., and I don't doubt it, for he had it all his own his way and ducks were plenty. Now, all this sport to be had within an hour of the capitol and in winter, while up north about here the lake looks like an arctic ocean, and our beautiful river is covered with fourteen inches of solid ice, where every day dozens of fast horses are showing their best gait on the smooth, solid surface.
LEATHER STOCKING.

PROPER MODE OF LOADING A CHOKE-BORE.—Our correspondent "Forest Aisle" sends us the following valuable suggestion:—

"I noticed in your issue of Feb. 8th a question from "W. H. S., Philadelphia," respecting the poor target made at 40 yards by his Scott choke-bore, and as I have just completed an extensive and pretty exhaustive trial (using one of Messrs. Tolley's finest "Paragon" choke-bores) of various modes of loading cartridges for choke-bored guns, I send you a suggestion in the interest of "W. H. S." Let him charge with 3¼ drachms of C. & H. No. 6, and 1½ ozs. of No. 6 shot, and use over the powder a thick, soft felt Ely's wad, and over the shot half of a similar wad, cut even and level with a sharp knife. The paper shell should not be turned down more than will suffice to just hold the wad in place. If his gun is really a good shooting choke-bore he will be surprised at the vast improvement produced, both in the pattern and in the uniformity of shooting by this mode of loading. Charged in this way my "Paragon" gave at my last trial the splendid average of 218 shots in the 30-inch circle, the entire load, moreover, being taken in two shots out of the six bodily into the 36-inch square. On the other hand, when loaded with a hard, inelastic card wad over the shot, instead of a felt wad, the pattern went down at a stroke to 110—just half—and when the gun was charged with a pink-edge over the powder, and two ditto over the shot, to 113. I may add that my experiments have proved that the extreme choke is not only a very powerful but also a very delicate instrument."

FAIRFIELD COUNTY, CONN., February 5th.

EDITOR FOREST AND STREAM:—

I would a word further, in perhaps, a fault finding manner, but it seems as though through your paper the common sense of many so called sportsmen might be touched, that could not be reached in any other way, for they all quote from you as they would from the Law or the Gospel. It is in reference to the land owners rights. The law now reads that quail shall be shot only between the 20th day of October and the 1st day of January. (And as the Legislature is now doctoring the game laws it had better let woodcock alone and make the close season for quail extend to the 1st of November). On the 3d of October two gentlemen made their appearance here for the purpose of quail shooting. They started out with that intent, flushed a bevy, and one bird is brought to bay. Pretty soon another single bird is flushed and one of the gents is brought not to bay, but to earth, recieving a charge of No. 10 shot in his head, accidently from his companion, putting out his right eye; no more quail for him this fall. On the 19th two more "sportsmen" make their appearance and succeeded in driving a bevy between two farmers houses and blaze away during the afternoon, kill sixteen of them, because they have been in the habit of being fed around the barns and could not be driven away any distance, and when attempts were made to get out a warrant, no Justice would issue it; but one was finally procured for trespass, and by the time it was in the hands of the Constable, the parties were in your State telling of the fine bunch of birds they poached up in Connecticut. Another case was that of a party driving a bevy into a gentleman's garden and blazing away to the great danger of the people in the house. When remonstrated with (for the birds had been cared for like chickens, and fed as regular,) they answered with all the slang of a street gamin's vocabulary. Such things prejudice the land owner against all who carry a gun, and have been a curse to all true sportsmen.

Some of the best grounds, for both cock and quail shooting, in this and neiguboring towns, have notices similar to this stuck up all over them and wo to the man that is caught trespassing in such a case. (All persons carrying a gun are positively forbid trespassing). But still, thank fortune, there are a few "true blue" sportsmen who are willing to accord to all their rights. And to them the fields are open, and to all such we say come and see us in the season and we will let you cover the ground, but from the selfish sportsmen, spare us. I think I can now sign myself a
LEGITIMATE GRUMBLER.

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus.*	Grouper, *Epinephelpus nigritus.*
Drum—two species. Family *Sciænidæ.*	Trout (black bass) *Centropristris atrarius.*
Kingfish, *Menticirrus nebulosus.*	Striped bass or Rockfish, *Roccus lineatus.*
Sea Bass, *Sciænops ocellatus.*	
Sheepshead, *Archosargus probatocephalus.*	Tailorfish, *Pomatomus saltatrix.*
Snapper, *Lutjanus caxza.*	Black Bass, *Micropterus salmoides; M. nigricans.*

FISH IN MARKET.—Notwithstanding the enormous quantity required for the Fish Culturists dinner last week, and also the fact that Lent has set in, the supply of fish remains large and prices low. Very fine large shad, weighing five pounds each, are arriving from Newbern, North Carolina. Sea bass and red snappers are coming from Brunswick, Georgia, and codfish were never so abundant on the Long Island coast. Our quotations are as follows:—Striped bass 15 to 25 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen), 30 cents; shad (southern), $1.50 cents each; mackerel, 25 cents; white perch, 15 cents; green turtle, 22 cents; terrapin, $18 per dozen; frostfish, 8 cents per pound; halibut, 15 cents; haddock, 7 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 15 cents; turbott, 20 cents; scollops, $1.50 per gallon; whitefish, 20 cents per pound; pickerel, 20 cents; sunfish, 10 cents; yellow perch, 10 cents; salmon trout, 15 cents; hard shell crabs, $3.00 per 100; soft crabs $1.25 per dozen; red snappers, 18 cents per pound.

BEAUTIFULLY GOOD.—A correspondent, "G. F. W.," of Putnam, Ct., who was almost always with Daniel Webster on his fishing and hunting expeditions, when he went home to Marshfield, writes to us, saying: "I caught the last mess of trout he ate, and after I had them nicely browned and brought to him, 'Ah, George!' said he, 'they are beautifully good.' I never saw him alive after that time."

Daniel was a dainty angler, and dainty in his epicurian tastes.

ARTIFICIAL FLY-FISHING—*Black Bass the Coming Game Fish.*—Thirty years ago fly-fishing was scarcely practiced in this country. A few New England natives tossed their nondescript lures into the trout streams, 'tis true; but as for salmon fishing with fly, none thought of it. Only a few Canadians in Canada, an occasional adventurous officer of the British army on leave, and a dozen or so English-men and "canny Scots," resident in the States, were cognizant of this peculiar artifice of the angler, and indulged in its practice. And with what ponderous "Castle-Connells" they pounded the vexed waters where the unwary Salmo Salar dwelt! [With a huge pine tree, the Polyphemus sat on a mountain and bobbed for whales.]

Only within five years or so, have Americans raised a company of matriculants for this advanced school. It is rare to find an expert salmon angler among the "native and to the manor born." With trout it is different. Trout fishing was made fashionable many years ago, by several writers—notably by "Rev. Adirondack Murray"—and now on every stream where the trout live, a dozen persons who call themselves fly-fishermen, may be found on any summer's day, coquetting unsophisticated fingerlings with highly varnished rods and flies of questionable pattern. Each one imagines himself an expert, or hopes, with a little more practice, to master the art. Ask him what he defines the art of fly-fishing to be, and, ten to one, he will answer "The capture of *Trout* or Salmon with the artificial fly." No other kind of fish will suggest itself in this connection. Few are aware that any other varieties of fish can be taken with the fly.

Two years ago the mention was incidentally made, in print, that black bass would take the fly, and the angling brotherhood were incredulous. At once the assertion was questioned, and the discussion arose, with wide-spread interest: "Do black bass really take the fly?" and to this day there remains an army of unbelievers. They have fished for bass with fly, tried the experiment thoroughly, and got no "rise." Possibly, the same army would not succeed much better with the trout. They select the wrong localities for their trials. And yet, we are bound to say that we seriously believe that the black bass is to afford the weight of sport for the fly-rod in future. Trout are gradually being driven out of the streams. They re quire elbow room and the solitude of the primitive forests, just as old Leather Stocking did. Trout cannot thrive in civ-lization. When cultivated they become degenerate, pale and flabby. On the contrary, the black bass will thrive anywhere, without much care. Give them a fair start and they will propagate and multiply. They are not fastidi-ous. They feed at the bottom or at the surface as inclination prompts. The black bass turns over stones for Hellgramites, and leaps into the air after the flying moth. He does not discriminate as closely as the trout does. More-over, he inhabits a wider range of territory. He is equally at home in the foaming outlets of the back lakes of Canada as in the somewhat turbid waters of Arkansas and Louisiana, and in the smoothly flowing rivers and still lakes of Florida. He is widely, nay, almost universally known. He is known to urchins whose grandpas never heard of a trout—the *salmo fortinalis*. And long after the latter has been choked by sawdust, poisoned out of exist-ence by tar oil and dye stuffs, and annihilated by nets and poachers, the black bass will hold his own (and more too,) and rise to the fly of the next generation as gracefully as the latter will rise to explain why their predecessors did not know as much about fly-fishing as they do. Surely, the Black Bass is destined to be the coming fish for anglers with the fly.

But more than this: Let us ask how many readers of these lines are aware that, besides the salmon, and the trout, and the black bass, and the shad and the pickerel, the grayling and the other varieties that inhabit *fresh* wa'er, a great many salt water fish afford equally good sport to the same kind of hue? Why, at times the sea is alive with surface feeders. We have taken the cod at Sandwich Bay in Labrador, the pollock in the Kenebeccasis, herring in Massachusetts Bay, and mackerel off Cape Breton—all with the fly-rod and reel. In the Homosassa river alone, on the Gulf of Mexico, are no less than eight varieties of salt water fish that take the fly. We have known of 60 lbs. of weakfish to be landed there within an hour by one gentlemen alone. The cavalli and redfish afford extraordinary sport. By and bye, we be-lieve that fly-fishing will be the only legitimate mode allowed in polite circles. The vulgar clam and sinuous worm will be tabooed; the beastly crawfish and dobson (*horrenda monstra!*) will be thrown aside; pork will be re-served only for the sea-sick; and cut bait for the starving human poor. Only that which is etherial will engage the angler. The lures with which he tempts the limpid lake, or turgid brine, will float only on wings of silvery light, reflecting the rainbow hues, touching the spray of the waterfall or the combing of the surf in their lambent flight. So shall men rise above that which is common and un-clean and grovelling, and prepare for the higher and better life to come. Yea—verily!

—Striped bass, locally known as rock fish, made their appearance in the Delaware river some two weeks ago, and weather permitting, fishing with seines will be in order from this time until May.

Extra large white perch are now being taken in the Chesapeake, weighing 1¼ each on the average.

MOVEMENTS OF THE FISHING FLEET.—The George's fleet have not yet begun to arive in any considerable numbers but the early fleet will soon be along, to give the much needed impetus to local trade. The Bank and LaHave fleets bring in good fares, indicating the presence of fish upon their breeding grounds, and the prospects are favor-able, if good weather prevails, for a good Georges catch. The shore fleets are also meeting with a little better suc-cess, some excellent fares having been landed, and now that Lent has arrived we may reasonably expect an im-proved call, and to see a little more money in general circulation. The number of fishing arrivals for the past week has been 27, viz.: 7 from Grand and Western Banks, 15 from LaHave and Georges Banks, 3 from Fortune Bay, and 2 from New Brunswick and Nova Scotia herring trips. The receipts of codfish have been about 450,000 pounds, and of fresh halibut, 360,000 pounds.—*Cape Ann Advertiser, Feb, 16th.*

LOOK TO YOUR FLY-BOOKS.

EDITOR FOREST AND STREAM:—

I am philanthropist enough to wish to warn my fellow anglers, if it is not already too late, to look to their fly-books for moths, and to carefully pick over and remove at once, all flies that moths may have tainted or destroyed. Although sufficiently careful, as the word goes, I find to-day that I have lost several dollars worth of trout and salmon flies by failing to examine my stock during the winter; and it was only by good fortune that I am now enabled to save what I have. Having purchased one of Holberton & Beemer's fly-books, at your suggestion, that the new method of adjusting the flies in the book ensured them against the attacks of moths. I was in the act of transferring my stock when I made the discovery I did. Nothing affords better attraction for moths than the bunches of flies tucked away in the pockets of the old-fashioned fly-book. In the Holberton book, the flies are not only detached from each other, but the snells being stretched on the open face of a parchment card, do not afford sufficient seclusion to invite the depredations of the vexatious creatures that destroy and corrupt. Yours,

BLUE DUN.

FLORIDA—*Halifax River, February 6th.*—The travel thus far to Florida has been light, and the hotels in Savannah, Jacksonville, Green Cove, etc., have had few guests. Great preparations have been made; two new hotels of the first-class—"The Windsor" and "The Nichols House"—have been opened in Jacksonville, and one of the local papers asserts that there are over fifty steamers on the St. John river. I tried the new route to this river by way of Cres-cent City, on Dunn's Lake, but was not pleased with it. The steamer from Palatka to Crescent City is an old and disabled boat, the accommodations at Crescent City are poor, and the route across the country to Dayton is long and difficult. Moreover, the promised steamer on the Halifax is not ready. For the present, therefore, I recom-mend those bound to Halifax river or New Smyrna, to take the old route by way of Enterprise. Much rain has fallen of late, and the streams are full. So much fresh water has flowed into the Halifax as to kill most of the oysters in the upper part of the river and drive away the fish. At the Inlet, however, the fish are plenty. I have been out twice with a companion, and our score for the first day was eleven bass, twelve sheepshead, one grouper, one salt water trout. The second day eleven bass; aver-age, five pounds; one drum, sixteen pounds. The first day the bass ran somewhat larger, say seven pounds. On ac-count of the cold weather, the oranges in the northern part of the State have less sweetness than usual. Here they are better. S. C. C.

CONFLICT BETWEEN WATER BAILIFFS AND SALMON POACHERS.—The floods caused by the recent heavy rains in the Forth district have brought up a large quantity of breeding fish, the spawning grounds of the higher reaches being at present swarming with salmon. Superintendent Napier, suspecting that the temptation would be too strong for habitual poachers, despatched a number of water-bailiffs on Saturday last to watch the River Allan and tributary streams above Dunblane, and between ten and eleven o'clock that night a gang of poachers, numbering between seven and eight, were seen "blazing" the Muckle Burn, between Kinbuck and Greenloaning. They carried torches, and were armed with spears and sticks. The watchers advanced, and came up to the poachers in the middle of the stream, and the latter, who were in greater force than the bailiffs, showed signs of resistance, but nothing daunted, the bailiffs closed with their opponents, and a determined struggle followed, batons being freely handled on the one side, and the instruments of illegal fishing on the other. The combatants rolled together in the bed of the stream, and hard blows were given by both parties. After a short but severe conflict the poachers were overpowered, three of the gang being cap-tured and the rest taking to their heels. The bailiffs seized a number of torches and spears, together with two bags containing seven large salmon and grilse, cruelly torn by the leisters of the poachers.—*Land and Water.*

A CURIOUS FISHING INCIDENT.—The following singular circumstance was communicated to the pages of the *Sporting Magazine* as long ago as 1796:—*The Editor of the Sporting Magazine:*—Happy, at any time, to contribute to your very valuable collection, I beg you will insert the following fact, which I flatter myself will not be unworthy of a place:—

A countryman, of the name of Strugnell, having fre-quently observed the water of a pond, called Charlrey Pond, very much disturbed, though at the time there was no wind, thought it must be some fish; but on account of the mud surrounding it, there was no possibility of trying it with a rod and line, which made him form the follow-ing contrivance, supposing it to be a pike. He took a duck, and, fastened a string, about ten feet long, tight around its body, to which was suspended a double hook baited with a roach. The duck, as was natural, took to the water, and, in less than a quarter of an hour, the fish took the bait, and, instantly going to the bottom, the duck was for sometime also emersed in the water, till at last, after a struggle of half an hour, the duck with the greatest exertions made the bank, when, by placing boards on the surrounding mud, a boy ventured on, and, having tied another string to the duck, they were both brought to shore, when the man too eagerly laying hold of the pike, it snapped at his hand, which he pulled away. It left one of its teeth in the man's hand, which almost immediately swelled, and occasioned the most excruciating torture, when Dr. Wilmot, an eminent surgeon of this place, was called in and extricated it. The fish weighed thirty-six pounds four ounces, and was purchased by Mr. Puper, First Purveyor to His Majesty. The head is preserved by the Doctor. If any doubts should arise, a letter addressed to the Doctor will fully ascertain it. I am, gentlemen, your well-wisher and constant reader. E. D. STRELLER.

Windsor, March 10th, 1796.

NEW YORK YACHT CLUB.—The New York Yacht Club held a special meeting on last Thursday evening at the club rooms, Madison avenue and Twenty-sixth street. The committee appointed to inquire into the financial condition of the club reported that it was very seriously crippled, and that the only way out of the difficulty was to give up the club house on Staten Island, and also the club rooms at Twenty-sixth street and Madison avenue. After three hours' debate the report was adopted abolishing both club houses. The Staten Island club house is to be pulled down in two weeks, but the lease of the Twenty-sixth street rooms will not expire until May 1st. A committee was appointed to hire a room for $1,000 a year where the club models can be stored. The sum of $2,500 was appro-priated to the Regatta Committee to cover this year's ex-penses.

BROOKLYN YACHT CLUB.—The second regular meeting of this Club was held on Wednesday evening, at the Club rooms in the Continental Building, corner of Court and Montague streets, Brooklyn. The officers who were elected at the annual meeting last month entered into the perform-ance of their various duties. Mr. Cornelius S. Lee, of the yacht Schemer, and Mr. Andrew R. Culver, President of the Prospect Park and Coney Island Railroad, were elected members. The Club now numbers about three hundred and is steadily increasing. A banquet was subsequently given to the members by the new flag officers, Messrs. Dickerson, Smith and Huntley.

EASTERN YACHT CLUB.—At a meeting of the Eastern Yacht Club, held February 13th, at the Parker House, Boston; the following named officers were electe 1: Commo-dore, John M. Forbes; Vice-Commodore, Charles Whitney; Rear-Commodore, W. D. Pickman; Secretary, Henry B. Jackson; Treasurer, Patrick T. Jackson; Measurer, Clar-ence W. Jones; Regatta Committee, W. M. Whitney, John Jeffries, R. F. Clark, R. H. Stevenson, E. Rollins Morse.

—The coming season of the Williamsburgh Yacht Club promises to be one of the busiest in the annals of that or-ganization. Three of its members, Messrs. John Schmidt (Vice-Commodore), Joseph Northrup and John Driscoll, are having yachts built for them.

—The Hudson county Steam Yacht Club has been incor-porated with Sheriff P. H. Laverty as President; Surrogate Robert McGague, Treasurer; William A. Brower, Secre-tary, and President of the Senate Leon Abbott, with the other officers, as Executive Committee.

NOVA SCOTIA YACHT SQUADRON.—The following are the recently elected officers of the Nova Scotia Yacht Squad-ron:—

Commodore, His Excellency the Earl of Dufferin, Gov-ernor General of Canada; Vice-Commodore, S. A. White (re elected); Rear Commodore, H. St. G. Twining; Secre-tary, F. C. Sumichrast (re-elected); Treasurer, J. W. Stairs (re-elected); Committee of Management, D. Cronan, J. E. Butler, A. C. Edwards, D. C. Chalmers, J. Fraser; Sailing Committee, Lt. Col. H. W. Clerke, F. M. Passow, G. A. Black, H. W. Brookfield, J. W. Stairs; Measurers, J. E. Butler, Roderick McDonald.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Publications.

Now Ready,

The Plains of the Great West and their Inhabitants,

BY COL. RICHARD IRVING DODGE, U. S. A.,

With an Introduction by Wm. Blackmore.

One Volume, Large Octavo, Very Fully Illustrated. $4 00.

"This is by far the most comprehensive and intelligent volume that has ever been written of the Far West. It is alike invaluable to the sportsman, the settler, the overland traveler, the trapper, and the soldier. It is written in the plain language of one who has been there and knows. * * *. Next to the compass, this book becomes a necessity. To be without either involves great personal risk and detriment. —FOREST AND STREAM."

For sale by all booksellers and by the publishers,

WIND-PROOF

Leather Vest and Jackets,

Flannel-Lined.

(Made and sold only by Messrs. G. W. SIMMONS & Co., OAK HALL, BOSTON,) are considered the most sensible protectors ever devised for winter wear. They are especially adapted to the requirements of sporting men, whose rapid walking is likely to be followed by frequent halts in the cold wind. Price, Vest $7; Jacket $9. Measurements required are Waist, Breast and Inside Seam of Sleeve. Mention Height and Weight.

LADIES LEATHER VESTS AND JACKETS

made to order. Indispensible to all who are in any way exposed to the weather.

G. W. Simmons & Son,

32 to 38 North St., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old-settled bird—which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have got them all down fine.' This need not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarsill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holabird! Scatter! you beggars, scatter!'"—FOREST AND STREAM.]

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G.W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending "Coals to Newcastle," but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP. DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

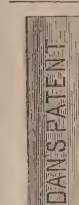
One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,



"OAK HALL," BOSTON, MASS.

New Paper Shell Conical Base.

WILLIAMS' PATENT.

Manufactured by the ST. LOUIS PATENT SHELL M'F'G CO., office 2,239 De Kalb street. The advantages claimed for these shells are: Cheapness, a saving of 25 per cent. in the use of powder, less recoil. These shells are equal to the best English, and 3¼ drachms of powder will do the work of 3 drachms in any other shells. The sizes made are No. 10, 2¾ inches; No. 12, 2¾ inches. Longer shells made to order at extra cost. Ask your gunmakers for them and use no others. Shells are not mailable. Sample 100 will be sent by express on receipt of $1.30 for 10s or $1.15 for 12s.
Feb. 22-1y.

Paper and Metallic Shells

FOR

Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers. dec23 tf

Highest Honors
AT THE
CENTENNIAL WORLD'S FAIR, 1876!
THE
SHONINGER ORGANS

PRONOUNCED UNANIMOUSLY AS THE

Best Instruments,

Their comparative excellence is recognized by the **Judges** in their **Report**, from which the following is an extract:—

"The H. **SHONINGER ORGAN CO.'S exhibit as the best Instruments** at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made threeply, put together so it is impossible for them to either shrink, swell or split." **THE ONLY ORGANS AWARDED THIS RANK.**

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.

New styles and prices just issued, which are in accordance with our rule, the **BEST ORGAN** for the least money.

We are prepared to appoint a few new Agents.

MOLLER'S NORWEGIAN COD LIVER OIL

Is pronounced by most distinguished medical authorities of America and Europe to be the very best. Its superiority is evident from the great estimation in which it is held by New York physicians generally. Prizes from all the great International Exhibitions, including the Centennial, testify convincingly as to its merits.

For sale by all Druggists.
Agents, W. H. SCHIEFFELIN & CO
Dec21-3m.

A VICTORIOUS INVENTION.

The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation.

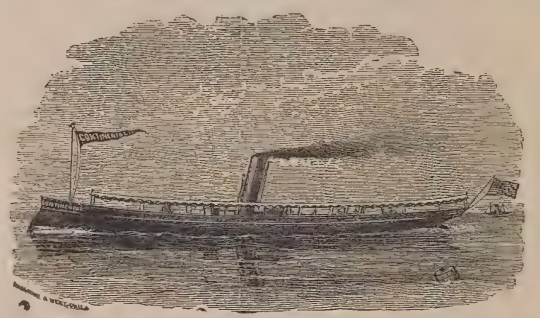
It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape.

It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

PRICE LIST:

No. 1—For fishing and all kinds of small game and animals sent by mail.....50 cents
No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, &c.....75 cents
No 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, &c. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight 10 to 15 lbs. $10

All goods sent charges paid to any address on receipt of price. Address



Chas. L. Coate,
480 Fulton St., Brooklyn, N. Y.
P. O. Box 214.

For Forest and Stream.

THE "EASTERN SHORE."

THERE'S a quaint little cot, near the Elk's quiet stream,
It is perched on the top of a hill;
My thoughts of time passed there, came back like a dream,
Yet a dream that recalls nothing ill.

There's the meadow grass, fragrant and green,
Which hides the young covey, and old mother bird;
The brake, where the woodcock are seen,
And the hermit-thrush's song may be heard.

Then there's the ducking point, under the willows,
The cabin, quite hid by the trees.
The glassy cove, out of reach of the billows,
And the wreck, with its jagged oak knees.

Oh, The health-giving breezes, across that hill-side,
Through the old swaying branches, so high in the air,
The gay boating parties, adrift on the tide,
All bring sweet recollection of days free from care.

J. W. H.

For Forest and Stream.

West Florida.

HER CLIMATE, SOIL, BAYS, RIVERS, LAGOONS, BAYOUS, CREEKS, GAME, FISH, OYSTERS AND OTHER ATTRACTIONS—THE CITY OF PENSACOLA, AND THE GREAT HUNTER OF LONG AGO.

AS it is not altogether foreign to the mission of the FOREST AND STREAM to hunt up and locate new fields for the occupation of the northern and western sportsman, and observing also frequent notices of East and South Florida in your valuable journal, I have thought that perhaps something with reference to the attractions and advantages of this section of the State which, apparently, are little known to the sportsman and tourist from the North and West, might be of interest to some of your readers.

By reference to the map you will see that Escambia county forms the extreme western extension or boundary of Florida, and with her numerous and magnificent rivers, bays, lagoons, and bayous, and the most flourishing and important commercial city in the State (Pensacola) and the pet Navy-Yard of the South, appear to occupy an obscure corner somewhere in the wide world. To the peculiar geographical location, as much as to any other cause, may perhaps be attributed the fact that we have been so long overlooked by the many thousands who visit Florida annually in search of health and pleasure, but now, since the tide of immigration is flooding all South, East, and Middle Florida, it is time that we of the West should wake up and let people know, that notwithstanding the isolated position given us on the map, we have railroad, steamboat and sail communication "with all the world and the balance of mankind," and that sportsmen, tourists and immigrants from the great northern and western centers can visit us in less time and with less expense than is required to reach the extreme eastern and southern portions of Florida, and that as to health, climate and soil adapted to orange culture, game, fish, oysters, forests, streams, and all other beauties of nature, we yield nothing to any section of the southern country.

To enumerate a few of the advantages which we can offer the sportsman, tourist, or immigrant in search of a pleasant home, I will state first that we have more shell hammocks and other beautiful and valuable locations for homes and orange groves on the Perdido, Black Water, Escambia, East Bay, and Choctawhatchee rivers, and on Palmetto, Soldier, St. Johns, and Stone Quarry creeks, on the Grand Lagoon, Bear and Deer Points, and on Bayous Grande, Checo, Texar, Marquis, Garcon and Tarkill, all within a few hour's sail of Pensacola and the Navy-Yard, than can be found anywhere else in the world in the same space and extent of territory. These innumerable locations are all bounded by beautiful water courses, abundantly supplied with oysters and fish of every description, and can be purchased for a mere fraction in comparison with the prices now paid for similar locations in East and South Florida, and what is better still, are entirely exempt from that type of indigenous chill and fever so prevalent in some sections of the State, and which is so much dreaded by the new and unacclimated settler.

Until recently very little attention has been given to the orange culture in this section of Florida, but enough is now known of our climate and soil in this respect to warrant the venture. We have three nurseries of young orange trees now in operation within a short distance of Pensacola and one within a mile of the Navy-Yard: The young trees grow rapidly in the natural soil and present a healthy and vigorous appearance, and what is most remarkable, passed through all the cold snaps we have had the past winter without injury, while young and old trees were seriously damaged as far east as Indian river, and as far south as Tampa Bay. We have also several full-grown bearing trees at the Navy-Yard which are entirely exposed to the north wind, and which sustained no perceptible damage. Why they were so favored is a subject of much speculation with the sage philosophers who advance many theories, the most popular of which is that the large and numerous bodies of water encircling us on the north and our close proximity to the Gulf on the south, tempers and moderates the cold dry winds in the winter season. It is also a popular belief with many here, that orange groves in this section of the State will succeed best when reared from the seed instead of transplanting young trees from foreign soil; that is to say, the tree, to be hardy, must be made native to the soil and climate in its germination.

The sportsman and tourist in search of health or pleasure can obtain first class board at private houses in Pensacola, or here at the Navy-Yard, for $25 to $30 per month, and for a trifle more at the leading hotels. Fishing, hunting, or excursion parties, can at all times secure small steamers or sailing craft, suited to their purposes, at very reasonable rates. By a well devised system of quarantine regulations, inaugurated by commander John F. McGlensey, U. S. N., while in command of the Navy-Yard here and the present able and energetic Mayor of Pensacola, Hon. J. P. Jones, that city and the Navy-Yard are now as secure against the introduction of yellow fever as any port in the United States, and since which time, no city in the South has advanced more rapidly in material development and prosperity than Pensacola. With her city government, railroad and commercial interests in the hands of able and experienced men, she could not do otherwise than go ahead. More vessels, first class, foreign and domestic, visit this city annualy, than any other city of its size in the world, and the yellow pine timber and lumber business is immense, amounting to several millions annually. Several cargoes of cotton have been shipped direct to Europe from this port the present season, and by proper effort on the part of our leading business men, Pensacola may be made the grand outlet for the entire cotton crop of West Florida and Alabama, besides drawing much of the staple from Louisiana and Georgia. With 24 feet water on her bar, a splendid land-locked harbor, the most magnificent bay in America, backed by an interior country with abundant sources of wealth, Pensacola, with all these advantages, is bound to become one of the leading commercial cities of the South. She has now a thrifty population of 7,000, and, speaking generally of this section, I do not exaggerate when I say that West Florida has mines of wealth, yet undeveloped, amply sufficient to enrich half a million of intelligent and enterprising men.

So much for business prospects of this portion of Florida, and now, if the FOREST AND STREAM will indulge me, I will change the "subject of my narrative" and give the readers a brief account of one of the most remarkable hunters of our country, who spent seventy years of his life on the streams and in the shell hammocks and pine forests of West Florida, and whose "headquarters"—a little log cabin—stood on the summit of a high elevation, now known as "Red Bluff," on the Grand lagoon, five miles west of the Navy-Yard. This old hunter was a half-breed, a mixture of Indian and Spaniard; the Indian in many respects, predominating. His "exploits by flood and field," if faithfully related by a skillful narrator, would give your readers some idea of the fish and game qualities of this section of Florida, and place his name high up on the roll of distinguished hunters and sportsmen. He claimed to be allied to the old tribe of Indians who first occupied East and South Florida, and "sported," from individual choice, the singular, and no doubt to him euphonious, name of "Billy Buckhorn." His early life was spent in the wilds of East and South Florida, and he was perfectly familiar with the best fishing and hunting grounds from the Everglades, in South Florida, to the western extremity of the State. By his skill and success in fishing and hunting, he accumulated a snug little fortune, but his love of sport, impelled, no doubt, by force of habit, lead him almost daily many miles away from his home, and within a radius of one hundred miles of his cabin, he had many favorite camping places. His camping grounds were always selected and located near some beautiful "spring-head," or running branch of sparkling water, of which this country abounds. His favorite hunting grounds for bear and deer lie on the Alabama side of Perdido Bay, about 12 miles west of this place. He frequently hunted, with great success, on Santa Rosa Island and on what is now known as the Live Oak Naval Reservation, six miles east of the Navy Yard. This "reservation" is a dense hammock of several hundred acres and is reserved by the United States Government for timber purposes. No one is allowed to live on this vast track of land, which forms a sort of peninsula, and being connected with the main land, is not only the home, but the paradise of the deer, turkey, squirrel, 'possum and other wild game, to this day. His mode of hunting, in the immediate vicinity of his home, was somewhat novel and peculiarly his own, and was adopted, he insisted, for the reason that nothing would drive deer or turkey away from their old range so effectually as would hunting them with dogs. When he started out for a short hunt and wanted to make sure of his game, he would take either his trained deer or turkey for the purpose. He had also a trained dog, of the common cur breed, who was taught never to bark except on trail of wounded game, but by certain brisk movements of the tail, gave warning of the presence of game. If in the pursuit of deer, "uncle Buck," as he was called by the first settler of this section, was accompanied by his cur and trained doe, and when hot scent was discovered by the dog, all came to a halt. The doe was then sent forward to scamper over and scour the woods in ever direction, while the hunter and dog found the nearest hiding place. If a wild deer was anywhere near, the lapse of a brief time was only necessary to bring the coveted game within easy range of his unerring rifle. By instinct or training, the instant the tame deer was discovered by the wild native of the woods, she would speedily return to where the hunter was concealed, closely pursued by the wild deer, and uncle Buck had only to make his selection, if more than one, and then for the nearest cut home. In this way a great many deer were killed within a few rods of his cabin. And so, if turkey hunting, he would take his trained turkey—usually a young hen—and when fresh sign was discovered or the turkeys seen at a distance, he would stop suddenly, select an open space, fasten his turkey with a small cord to a stake made for the purpose, and conceal himself near by. When left alone the tame turkey would exhibit signs of distress and commence "yelping" in a manner which would put to shame all inventors of the modern patent callers. By this device and employment of the "genuine article," uncle Buck was soon gratified with a shot which filled his bag and satisfied his cravings for the time being.

About one mile north of Red Bluff, the site of the old hunter's home, on the Grand Lagoon, is an immense hammock, 12 miles long, running parallel with the Lagoon, east and west, to Perdido Bay. This hammock, besides being the native home of bear, deer, turkey, squirrel, 'possum and coon, is the favorite roosting place for all the wild turkeys for miles around, and which, from uncle Buck's day to the present time, fly across to the Lagoon beach at the crack of day in search of shell, coarse gravel and whatever else in the nature of food that may have been washed ashore during the night, and to bag one or more of these elegant birds almost any morning, the hunter must be an early riser in order to secure a good position commanding a long reach of sand beach before the turkey thinks of quitting his roost in the neighboring hammock.

During the prime years of his life, our old hunter made several visits to the scenes and hunting grounds of his boyhood, in East and South Florida, but as often returned to reassert his claims to West Florida, declaring that he would not exchange the fishing and hunting grounds along the west coast and the shell hammocks of our rivers, bays, lagoons and bayous, for any country he had ever seen. Uncle Buck, although spending half his life on the water, fishing and ducking, was no part of a sailor. He always used a small canoe or "dug-out," and a short, light paddle, served the double purpose of rudder and propeller. His sporting operations in the line of fishing and ducking were confined to or near the shore. He could never be induced to commit his frail vessel to the fickle breeze or treacherous wave, and whenever he had an occasion to cross from shore to shore, would seek the narrow passes and wait for placid waters. Uncle Buck had no particular or favorite fishing or hunting grounds for small game. When not off on a general camp hunt in the hammocks and pine forests, he might be found on the Grand Lagoon or on any one of our numerous rivers, lakes, bayous and creeks. Our rivers, bays, lagoons, bayous, and creeks, are all connected by water, and can safely be visited in small craft and abound with all kinds of salt and fresh water fish

while the islands, peninsulas and shell hammocks, which divide, intersect, and form their boundaries, are alive with game of all kinds, and furnish the hunter a most delightful field in which to gratify his love of sport. All along our water courses bear, deer, and turkeys are quite numerous, and can easily be killed still-hunting, fire-hunting at night, or by driving with dogs. Uncle Buck excelled as a "still" and "fire" hunter, and although the most skillful and successful hunter of his day, never exposed his game for sale on market centers. He would carry it on his back from door to door until disposed of, and then he would seek the nearest shop or store, purchase his supplies of whiskey, tobacco, ammunition, &c., and then off to the woods again like the wind, without saying good bye to anyone. He never sought new acquaintances nor cultivated intimate friendships, but lived almost entirely to himself. His greatest pleasure and happiness was found in the solitude of the wild woods or his lonely cabin, and if any man ever lived and died in close communion with nature, unadorned by the arts and sciences of civilization, he certainly was that man. He was truly an eccentric man. Reticent and morose by nature, yet he had his lively moods, and at such times would relate a deer hunt or bear chase in a manner that would thrill and interest the most daring and experienced hunter among your readers. He was never known to have but one intimate friend and companion, an old Frenchman, who for many long years shared with him the hospitalities of his cabin. This old Frenchman was supposed to have belonged to the tribe of buccaneers who infested this coast many years ago and whose favorite rendezvous was in Perdido Bay. He spent most of his time fishing and hunting, confining his operations exclusively to the Lagoon. Why these two strange men should select this Lagoon for a home and base of operations, can be easily understood when we take into consideration the fact that, in addition to its many other attractions, it furnishes good shooting for nine months in the year, and good fishing all the year round. This beautiful sheet of water is ten miles long and from one to two miles wide, lies parallel with the Gulf, east and west, and has its mouth or outlet near the entrance to the harbor. It is divided from the Gulf by a narrow strip of land, running from Fort MacRae to Perdido Bay. Its supply of fish, crabs and scollops, is inexhaustible. It supplies the towns of Woolsey, Warrington, and the Navy-Yard, and often supports hundreds of common laborers and their families when not employed in the Yard. Redfish, red and black snapper, speckled trout and flounders can be taken with hook and line at all seasons of the year, and in the fall and winter seasons, it literally swarms with great schools of roe mullet which are easily taken with cast nets. "Jacking" at night, is a favorite sport with many fishermen here, and a boat's load of sheepshead and other choice fish can be taken in this way by an expert in a very short time. This Lagoon also furnishes fine duck shooting all the year. The summer or wood duck remains here the entire year, and in the fall and winter it is visited by great numbers of mallard or English duck, red-heads, blackwing teal, wood duck, large crested, widgeon or bald head, bull heads, sawbill, black duck, gadwad, and the wild goose and swan. In the spring we have the sprig-tail or pin-tail, spoon-bill or shoveler and the blackwing teal. The latter come in great clouds and linger here until late in May. They usually feed in shallow water along the shore, and are often found in great numbers on the beach, which affords the stealthy and rapacious gunner a capital chance to slaughter them by the wholesale. I have seen as many as forty killed on the beach by a single discharge from an old smooth-bored musket heavily charged with No. 5 shot. This is the favorite spring duck here and is much sought after by the hotel and saloon keepers, and is also highly prized by Navy and Army officers. Besides the fish and game attractions there is a beautiful boiling spring of pure fresh water gushing out at the foot of Red Bluff, on this Lagoon, fifty feet below the top of the hill. The water from this spring is delightfully cool, and is as clear and transparent as a crystal, and will sweat a glass in July or August in a very few seconds. This bluff is one of the best locations in Florida for either a winter or summer resort. It can be reached by sail in two hours from Pensacola and in one hour from the Navy-Yard. There is also a good land route leading to it from Pensacola and the Navy-Yard. It is so situated as to command a fine view of the entire Lagoon, the entrance to the harbor of Pensacola and furnishes a splendid view of the Gulf as far as the eye can reach. In the summer season it is fanned by every breeze from the east, south and west, and in the winter it is completely sheltered and protected from the cold winds by high hills, dense hammocks and pine forests on the north. Of all the favored spots in Florida this Bluff would be my choice of either a winter or summer hotel. Within sight of the Bluff are three beautiful fresh water lakes, filled with trout or black bass, bream, large red-breasted fellows, and speckled perch, a very fine fish, meat fine grained and very white and weighs from half to two pounds. Right here is a big fortune and a delightful home for any enterprising gentleman with means who believes in printer's ink and who desires to embark in the hotel and timber business or the manufacture of turpentine, pitch, rosin, tar or other naval stores.

Like every one else who has visited Red Bluff, on the Grand Lagoon, I am so charmed and carried away with its many attractions and surroundings that I become oblivious to everything else when thinking of it, and you will pardon me for having dropped uncle Buck so often in the course of my ramblings. If you will excuse my many digressions I will resume and give you what remains to be told of uncle Buck, for whose traditional history I am indebted to an old Spanish citizen here whose father knew the great hunter well. At the ripe old age of 98, nearly a century ago, uncle Buck was suddenly stricken with paralysis, and on a bright spring morning, when the birds were all out singing joyfully, laid down on his cot to die. On the second day of his illness, the great woodsman closed his eyes to Red Bluff and its beautiful surroundings forever, and gave up the spot where he had lived so long and which he loved so well. His great spirit released, took its flight to the far off hunting grounds, where his remains were taken by his old friend and companion to Santa Rosa Island and buried near the beach, at the foot of a tall, majestic pine which still stands towering high in the air, a fitting and enduring monument to the great hunter who sleeps at its base, and where the wild and restless waves of old ocean, whose roar often lulled him into repose while living, still wash the beautiful white sands at his feet and unceasingly murmurs a sad and melancholy requiem to his memory. W. W. M.

Pensacola Navy-Yard, 1877.

For Forest and Stream.

LOUISIANA DUCK HUNTING.

PERHAPS no other State in the Union, and certainly no State in the eastern part of it, affords as good and varied shooting as Louisiana. One can find deer within twenty-five miles of New Orleans, wild turkey, woodcock, rail (*Sora*), snipe, curlew, rabbit, besides every variety of water fowl. The sportsman here, though, when he desires to go for a short stay will generally confine himself to ducks, and wind and weather being favorable, after an absence of twenty-four hours, a good hunter may return with fifty or even seventy-five.

The hunting resorts are numerous inasmuch as the State is cut up by many passes and innumerable bayous. By the first of November, or a little later, ducks come in abundance, and then the old Creoles, unable to resist the smell and sight of game, clean their guns, practice their dogs and make ready for their favorite pastime *la chasse*. And here let me introduce as a parenthetical clause the fact that if you start to go hunting with a Creole make up your mind first that he is a better shot than you are or you will learn the fact very soon. The Louisiana Creoles are with but very few exceptions elegant shots. They are all taught the use of a gun when boys, and learn to handle one with grace and skill. Our observation is that the average shot here in Louisiana surpasses the average shot of the Eastern States.

But to revert to our heading we will endeavor to give an account of a duck hunt and its attending circumstances. Bear in mind the fact that Sunday is the hunting day here, it being a Roman Catholic community and not inconsistent with their belief to seek pleasure on the Sabbath.

My friend and I agreed to try our luck and finally determined to go to the *Chef Menteur* (chief liar). The Chef Menteur is a stream of salt water running from Lake Borgne to Lake Ponchatrain through the eastern strip of the Parish of Orleans. Its width is about 185 feet, and on its banks grow a quantity of reeds about four or five feet high; no elevation of soil, nothing but the same low prairie land for miles and miles. But one tree flourishes, namely, the genuine live oak. The Mobile Railroad is built through all this low land, the rails being laid on a continuous frame work. We left New Orleans Saturday evening at five o'clock and found ourselves in the midst of at least one hundred and fifty other hunters. In ten minutes after the car started we merged into the awful swamp lands of Louisiana. Stagnant water full of old logs and dead grass, interspersed here and there by a splendid tree laden with silver grey moss which waved gently in the twilight, was all we saw to criticise. For sixty-five minutes the monotony was unrelieved, but now we felt the train slacken its pace preparatory to crossing the stream. This is the "Chef," said my friend, and in a moment we saw the blue water and heard the familiar sound of a train crossing a bridge. Immediately upon our arrival on the opposite side we jumped off with perhaps forty others. We crossed a bayou twenty-five feet wide running parallel with the railroad track, and were confronted by a house designated by a large and gaudily-painted sign "Banditti Cave." We entered and met the proprietor, "Nick" by name. Nick is indeed a fit man to be proprietor of a hotel with such a name. He is a very tall man, broad-shouldered, with high cheek bones and sinister expression; a miserable, surly brute who seems not to know that he is dependent upon gentlemen for his living. Nick is an American, but speaks English, French and Spanish as the necessity may be. No one knows his surname nor his history. He is a free man, unbound by laws, cares for no one, and is apparently content to live the life he does. Maybe Nick is more fortunate than we are who are subject to troubles—per chance Nick is less to be pitied!

We secured from him a berth for the night, and after laying aside our trappings went out to take a survey. "Banditti Cave" is fronting the railroad and the bayou mentioned, while on its right and at right angles to the bayou is the "Chef," and into which said bayou empties. Nick's hotel—if it can be called a hotel—is built on posts eight feet above the swamp, is a two-story whitewashed house, in size about 30x20 feet. We made the acquaintance of our fellow sportsmen and conversed until 11 o'clock at night. The air was bracing, so we found the fire in Nick's house very comfortable. We talked of dogs and guns. Naturally the Creoles are partial to a French gun, and it was finally decided that a breech-loader, with barrels made by Bernard, at St. Etienne, France, is the best in use. I disagreed with the gentlemen and maintained that the Purdy gun of England is the best. I am still of that opinion.

We made our decoys ready and went to bed. Soon all were asleep except myself. Nick had left a lantern burning dimly, and several times I sat up and looked around at the picture. Four dogs were lying down before the stove, and in the various corners of the room were game bags, fishing rods, guns, etc., etc. Nothing but hunting utensils. Soliloquizing may be pleasant, but with a heavy snorer above me and a very emphatic breather on my right, I seemed to forget the characteristic picture presented me, and before I knew where I was I joined the chorus, and snored.

My companion started suddenly and called me. I awoke and asked what time it was. Nick hearing voices rolled out of his berth in a semi-torpid condition, and by the lantern opened an enormous brass watch to find it was half-past two. Up we got and made ready. Nick in the meanwhile started a fire and cooked breakfast.

It was really cold out. We got our *pirogues* ready, and two colored men were on hand to paddle us. A *pirogue* is simply a little dugout capable of holding only two, and like a canoe very easily overturned. We put the decoys in the *pirogues*, which were hauled up on the shore, and laid our guns down. We then took our breakfast at 3 o'clock in the morning. The board at "Banditti Cave" did not groan under the weight of good things, but it held for us a substantial breakfast of coffee, ducks and eggs.

Our *pirogues* were shoved off, and by the aid of a lantern we saw where to step. "Be careful, now," said my man, "or the *pirogue* will upset." "All right now?" said I, as I stepped in and took my seat. "Are you ready Joe?" I shouted to my friend. "I am," said he, and we paddled down the "Chef" in darkness. We passed beneath the bridge, rounded a bend, and soon the memory of Nick, "Banditti Cave" and their paraphernalia was superseded by an uncommon anxiety to keep warm and shoot ducks. Our paddlers kept their *pirogues* near to one another, and silently we moved on, nothing making the slightest sound save the splash of the water as our paddles went in.

After having proceeded for a distance of two miles or more we came to a bayou and turned in. It was hardly wide enough for two, so my companion and his man shot ahead and led the way. The hour was about quarter of four, and we still had four miles to go. On we went, anon a duck flying up right in front, but too dark to shoot. Now we came to a junction of two bayous again, and we determined to separate, and did so. Soon we heard a noise in the distance and knew we were drawing near to the lagoon. A few more curves and by quarter to five we entered a "Louisiana duck's nest." The lagoon was fully thirty feet in diameter, and circular or nearly so.

We placed our decoys in the centre and paddled across to the further side. We then drew up the *pirogue*, and drew over it and us all the weeds we could. By 5 o'clock we were seated down in the *pirogue* awaiting daylight and ducks. It was exceedingly cold, but the hope of good sport was quite sufficient to make us willing to endure it.

Quauk! quauk! quauk! a short pause, then quauk! and the flapping of hundreds of wings. We expected to see a flock rise, but were disappointed, as the birds evidently were disinclined to move. It was very dark—so dark that we could not see our decoys even. However, in a few minutes the stars seemed to dim and we heard the ducks, but saw none. Finally I turned to my paddler and remarked that as yet not a duck had entered the lagoon. "Just you hold on," said he, and I did. Almost immediately two large French ducks sailed over the lagoon and lit near to the decoys. I stood up, but for the life of me could not distinguish them as the shadow of the reeds opposite fell over them and darkened them greatly. I was utterly disgusted. They remained for ten minutes, when with the inevitable quauk they rose with a whiz, and as they did so the report of my Reilly gun broke the silence of the morning air and opened the day's sport by killing as fine a duck as is eaten.

I quickly withdrew the old cartridge and was putting a fresh one in when Victor, my paddler, ejaculated the words stoop quick! I stooped and saw coming a magnificent flock. They seemed to halt, though, in the distance, and then veered to one side and easily escaped our gun shot.

The light was now bright enough to enable us to see tolerable well, but the hunting was not promising as the ducks remained in the prairie owing to the moderation of the weather. Indeed, when the sun rose the air became very much warmer, and the birds flew in twos or threes and seemingly avoided us then. We observed two coming and were ready for them, but suddenly one fell and the report of a gun was simultaneously heard. We knew that my companion was near so we shouted to him: Hallo! cried a voice we recognized. "Any luck over there?" cried Victor. "One shot and one duck," was the pointed answer. We remained for a while and killed a few, but the birds flew so poorly I determined to move. "Move on to Lagoon Catherine," I shouted at the top of my voice. "Go on and we will follow." We launched our *pirogue*, picked up the decoys and the ducks killed, and moved out towards the famous Lagoon Catherine. The sun was now well up and enabled me to see what the place looked like by daylight. We were going through a bayou ten feet wide, and surrounded on either side by prairies. As we would round a slight bend a couple of ducks would rise and we managed to get some. By seven o'clock we had

died into a lagoon black with ducks and *poules d'eau* (marsh hens.)

Whirr! whirr! splash, and a quauk. They all rose and flew the moment they saw us. We followed them for a short distance, and then determined to make a blind. Accordingly we did as we had done before, pull up the *pirogue* and concealed ourselves. My companion soon followed and made his stopping place about an eighth of a mile below me, so we succeeded in knocking many over. What he missed I generally killed; or rather *vice versa*, as he was a much finer wing shot than I.

A little strip of ground clear and moist jutted out from a point some little distance off, and a curlew (*genus numenius*) was enjoying himself greatly with picking up little morcels. "Victor," said I to my man, "do you think your gun can carry far enough to kill that bird?" "No sir," said he, "no gun can." "I will try mine and you watch his head." I aimed, and heard him utter the word foolishness, but 'twas too late. The curlew gave a skip, my gun sounded, and when the smoke cleared there was the bird dead as a hammer." Victor then extolled my fowling-piece as the best he ever saw, etc. After remaining until eleven o'clock we determined to start for home, and moved in that direction. We collected our game and started. Nothing of interest occurred for some time until we got into the main bayou which we had gone through at four o'clock. On the banks grew some very fine oaks, and under one we halted and ate lunch. A Louisiana bayou is a very curious looking stream. The water is quite muddy, but the curves and windings are so frequent that an interest is felt as to where you will turn up next. As we drew near to the "Chef" I observed palmetto and more trees. The moss hangs with very great beauty, and in many cases touches the water. Certainly a trip through one of these swamps is novel, and was to me very agreeable.

We came to a piece of prairie that had been burnt, and as English snipe frequent such we suggested to try our luck. We had no dog, and only duck shot; but after tramping over the flat for half an hour we bagged twelve fat snipe. The sun was hot, and consequently the birds were not shy and slow to rise. To make a successful snipe hunt it is absolutely necessary that you have a fine dog, and a dog accustomed to the prairie. Nothing wears out a man and dog so quickly as hunting on a burnt prairie. A kind of stiff stubble grows, the ground is full of holes, and man and dog are very apt to succumb before an hour's tramp. We got back into the *pirogues* and started for good. Before we had gone far I heard a whiz near me, grabbed my gun, and turned to see two *beck sie* (sanbill ducks) right over my head. I quickly fired, and both fell dead. Without flattering myself I say that it was an uncommonly fine shot, as the *beck sie* fly very swiftly and far apart.

Slowly we wended our way and soon turned into the "Chef," and made straight for "Banditti Cave." By three o'clock we turned, and in a few moments were on the porch of Nick's hotel. We had been gone just twelve hours. Our men cleaned the game and strung them. One by one our brethren sportsmen came in and announced their success or failures. One party of five had five *pirogues* and seven pieces between them. Others did little better.

"*Combein?*" said an old hunter to us. Forty-nine pieces in all. "*Tres jolie chasse,*" exclaimed the venerable Creole, and turned aside.

As our train did not leave until nine p. m. we dressed ourselves a little and cleaned our guns. Conversation was then in order, and served to while away the time. One gentleman brought in nine splendid red fish, two raccoons, and a wild-cat as the result of his Sunday's sport.

At seven o'clock Nick gave us supper, and about eight some one asked us to look back of Nick's house. We went out and there beheld in all its grandeur and terror a prairie on fire. It was about two miles off, and seemed to be burning for several miles in length. The wind blew a little and served to add to its splendor. It was terrific. The flames burst out and spread their fiery tongues towards Heaven and defied man on earth. No one can imagine what a sight it is unless he has seen it.

Nine o'clock came around and we were all ready to start. The train came along, and with a good night to Nick we jumped aboard. We reached New Orleans by ten o'clock and went to our homes, tired but pleased with our day. We had friends who appreciated a nice pair of ducks, and with pleasure do we remember the Louisiana swamps and "Banditti Cave." WM. HUNT, JR.

For Forest and Stream.

JOE MAREE.

OLD Joe is one of the few survivors of the Abenaki tribe, and has his headquarters on the Chaudiere river, fifteen or twenty miles from the outlet of Lake Megantic. In the fall you are likely to meet him anywhere between there and the Chain of Ponds in Maine. In a little eleven foot spruce bark canoe, with a scanty supply of flour and tea, he is "at home" anywhere. The substantial part of his diet consists in muskrat, in the capture of which he is very skillful. He is now over sixty years of age, but when I saw him last September no one would take him to be more than forty. I first met Joe some eight or ten years ago.

We (the Patriarch Captain, Bachelor Bill and myself) were on our usual autumn fishing trip, and were camped at the outlet. We had been three or four miles down the Chaudiere, where we had excellent trout fishing, and had just sighted the lake on our return trip, when old Joe put in an appearance, a bottle of whisky—or rather what was left of it—in one hand, bow and arrows in the other, and a very *expansive smile* on his dusky features. It was quite evident he had been *smiling* before. Talk of an *open countenance!* a little more open would have made an island of the top of his head. Meganic is not now quite the wilderness it was then. The Patriarch exhibited the *pale face* to an unusual degree upon Joe's sudden appearance, and in a still, small voice, remarked that "an intoxicated Indian 'round camp wasn't exactly the thing, and he was bound to get rid of him." From conscientious *scruples* he declined the proffered *dram*, but the rest of us thinking an *ounce* of prevention better than a *pound* of cure, took a *horn apiece* instead of a *pipe of peace*, and the "hatchet was buried." To all the Patriarchs hints "that Joe had a good ways to go to camp," Joe expressed a determination to camp with us—and he did so. We took one side of the fire, and Joe the other. His innate delicacy and good breeding showed. Although his "lodging was on the cold ground," he insisted on taking off his shoes, saying "he wasn't a horse to go to bed with his shoes on." With his head against a stump Joe slept. Whether he dreamed he was keeping *a wake* or not, I cannot say, but I know he kept *us awake*. He was bound to sing in his sleep, and the only effect an occasionally well-directed chip had, was to change the language of his song from English to French, or French to Indian. He told us next morning that too much whisky always made him *sing* in his sleep. "*Music* hath charms;" *his hadn't*. After showing his skill with bow and arrows (arrows fitted with a sharp blade like a jack-knife blade), Joe headed for the settlement to replenish his empty bottle, and as we shifted camp that day we saw him no more. In compensation for his board and *lodging* he gave us some beaver meat, and a couple of beaver tails, the latter a great delicacy. Joe's fondness for "fire-water" seems to be inherent in all Indians. On a subsequent trip, I saw him sell a beaver skin to my friend Buck for fifty cents, and Buck, to make the transaction "more binding," gave him a nobbler of rye. In ten minutes he had offered first a quarter, and then the fifty cents, for "jest a leetle more," but it was no go. That would have been "medicine" enough to have attracted him to our camp and kept him there, and we didn't want him just then, and still put Joe in a tight place, and he would keep all right. Some five years ago, Joe and I were cut off from camp by a gale that his little canoe wouldn't weather. For two days we watched our chances, and a little at a time worked round Spider Lake—some twelve miles—to make about three on our course. I had a flask of rye with me, but Joe wouldn't touch it. He evidently felt the responsibility of the position, or, perhaps, he couldn't swim. Well, let him have the benefit of the doubt. The course of true love didn't run smooth with Joe. He married a French-Canadian woman, but she soon left him, and I have no doubt "she's gone with a *handsomer man*." One of his sisters was shot by a skedaddler, called Blithin, at the Chain of Ponds, some fourteen years ago. Blithin was a trapper at Lake Megantic, and having, for some reason, taken a dislike to the squaw, followed and shot her, and having unsuccessfully attempted to burn the body, wrapped it in a blanket and sank it in one of the ponds, where it was afterwards found by a party going through to the Maine settlements. The body had broken loose from its anchorage and floated ashore. The next summer at a *portage* on the Upper Spider, I found an old vest, which our guide, Foster (formerly Blithin's partner), recognized, and which had been thrown off by Blithin when he followed the squaw. The matter was represented to the Maine authorities, but I have not heard that the murderer had been secured. Old Joe promised to "shoot him like a dog," if he ever finds him, but the probability is that Blithin has "gone under" 'ere this. Another of Joe's sisters was frozen to death two years ago, in returning from the settlement where she had been for provisions. Her dog was found near her, also frozen. In an attempt some four years ago to reach Quebec (by following Arnold's route of 1776), Foster and myself ran across "the rock on which we split," and with an axe, gun, and some fishing tackle, all we saved from the wreck, took our bearings from Joe's camp for the settlement near the beach of Lake St. Francis. Joe and his two sisters then occupied a good bark hut, comfortably lined with deer skins. Old Joe is still hale, hearty and strong as a moose. I hope to run across him some time this month, on my hunting trip, and to have him as guide on many subsequent trips. My glimpses into futurity will not enable me to say if I shall be permitted to write his obituary, but when he goes, the glory of the Abenaki will have departed, and amongst those who have hastened to the happy hunting grounds, there will be many a worse one than "Old Joe." D. THOMAS.

Sherbrooke, P. Q., January 6th, 1877.

MICHIGAN SPORT.

DEER, DOE, ELK, AND FISH, AND PLENTY OF THEM.

BAY CITY, Mich., Jan. 28th, 1877.

EDITOR FOREST AND STREAM:—

I cannot call myself an old time acquaintance with the FOREST AND STREAM, however warmly fond memory brings to the mind, recollections of the long ago, when its editor and myself were boys together. But a stray number coming under my observation has led me to wonder whether a few words from this land of the "Forest and Stream," pre-eminent, would not be of interest to its readers.

If there be in this goodly land of ours, one section which presents to the sportsman greater or more varied attractions than Michigan, I have yet to learn of it. In the days, scarce yet passed away, the fur-bearing beaver, mink, otter, wolf, and black bear, have laid the foundations for colossal fortunes to the fur traders, whose agents even yet traverse portions of the State, picking up the few (comparatively) specimens which still reward the amateur sportsman: and even yet is to be found an occasional hunter who devotes the energies of his existence to a wild life of solitude among the forests and lakes of the northern part of the State, in searching for those animals once so plenty, but which since the building of the several lines of railroad which point for their terminus toward the straits of Mackinaw, have yearly grown smaller in number, and beautifully less in the profit and sport afforded to the huntsman.

And yet these very lines of railroad have afforded facilities for the hundreds of sportsmen who yearly flock hither from the southern parts of this State, as well as from Ohio and Indiana, to reach those points where deer abound, and to transport to market the vast quantity (aggregating probably 100 tons or more) of venison, which their prowess has each year enabled them to ship to their homes or to eastern and southern markets. In the fall of the year it is no uncommon thing to see the cars running north from this goodly city monopolized by these doughty sportsmen and their dogs, and on one occasion last fall my curiosity to know to what extent the sport called out the hunter's, led to the counting of the forty-two rifles belonging to as many passengers seated in the two coaches which composed the train, while the baggage car looked as much like a dog kennel, as thirty dogs and hounds could make it. I will venture the assertion that in October and November of last year, there were fully 1,000 rifles in the woods within 100 miles north of this city, the owners of which were gathered from all over the Northern States, "camping out" in a majority of instances, gathering about the camp fire at night to recount the exciting and thrilling experiences, or rejoicing over the abundant success of the day.

Notwithstanding the immense number of deer which each fall become the prey of the huntsman, the supply does not seem to decrease in the same ratio that the hunters increase in numbers. I am sometimes constrained to think that there is a magic in the smell of powder which leads to the law of supply keeping pace with the demand. Whether or not the hunters shake their old clothes out thoroughly as they break camp, or some other potent spell is thrown about the timid does, one thing is potent, the does do multiply and replenish the supply in a wonderful manner. Can you account for the fact that no elk are found in the State except in that portion lying northeast from this city and embraced within the counties of (Northern) Tuscola, Huron, and Sanilac? Yet such is the fact, and they have been as "scarce as hen's teeth" in that locality for many years; although it is asserted that since the forest fires of 1871, when vast tracts of timber land had the surface vegetable mould burned to such an extent that thousands of acres of timber was uprooted and now lies prostrated in almost impenetrable jungle, the elk have sought the protection of these windfalls, and have perceptibly increased in numbers. A noble specimen weighing, it *was said*, 900 pounds, was brought to this city a month or more ago.

When I commenced this epistle I intended to have spoken of the gamy grayling which is found in some of our northern rivers; of the whitefish, with which our greater and some of the internal lakes abound; of the Mackinaw trout so widely known and so highly esteemed; of the pickerel and pike which swim in all our waters, and of the multitude of other members of the finny tribe, the capturing of which in our lakes and rivers give employ to thousands of men, and fleets of sail boats and steam tugs. I intended to say a few words about the city on the ice "Pickerelville," at the mouth of the Saginaw river, where at this moment it is estimated that 2,500 hardy fishermen are sitting in their little shanties of four by six feet, peering, spear in hand, through a hole in the ice, watching to plunge the barbed point into the back of the unsuspecting trout or pickerel, which swims along at a depth of from ten to twenty feet, steering direct to the decoy herring, which hangs by a line, to lure him to his fate; but my prolixity has already spun out to too great a length.

H. W. G.

Fish Culture.

CURIOUS FISHES OF THE NEW YORK AQUARIUM.

ADDITIONS, ETC., ETC.

THE last expedition sent out by the New York Aquarium, notwithstanding the extreme cold weather, has succeeded in reaching the city with rare treasures from the far northwest, and in magnificent condition. Among the finny prisoners are some beautiful specimens of the whitefish, and their appearance in the tanks reflects great credit upon Mr. Mather and Mr. Z. Coup, as this is the only successful attempt to transport the tender creatures alive. Some fine specimens of Wall-eyed Pike, Suckers and Ciscoes were also captured, and last and more interesting than all, a fine Lamprey Eel, the first one ever on exhibition in New York. It was moved with tender care by Mr. Zack Coup for over 800 miles, the enterprising ichthyologist standing by the cans night and day, stirring the freezing fluid with an energy that would have shamed the "Witch of Endor," and the satisfaction of seeing a *Petromyzontid* alive and well in the aquarium must well repay him for his martyrdom. It is particularly noticeable from the peculiar suctorial mouth, that is well displayed by its position in the tank—that of attaching itself to the glass by this curious organ. Upon each side, in scientific parlance, we find seven stigmata, each cutting an oblong gill sack, which interiorally communicates by a small opening with a messial tube common to all the sacks of both sides, and lying beneath the œsophagus or commencement of the digestive canal, but distant from it. This pharyngeal respiratory tube is closed at its distal end, and anteriorly communicates with the gullet by a valvular opening. When the mouth is not pressed against the glass the water respiration enters by it, fills the pharyngeal tube and flowing into the gill sacks and bathing the fixed gills lining their sides, is finally expelled by the seven stigmata or openings on each side of the neck. When the Lamprey adheres to the glass or some other object by its suctorial mouth, the water en-

ters the lateral stigmata, and is expelled by them again, the current in and out alternating. If the fish is held partly out of water so that one series of the stigmata are exposed and the other beneath the water, the respiratory currents will be seen passing into the submerged orifices, and rushing from the exposed ones with force. This interesting process was investigated thoroughly by Mr. Z. Coup in his vigils, as the creatures fastened upon his hand at various times, thus varying the monotony of the trip by practical scientific investigation.

The gill sacks of this curious creature are supported by what we might call a "cartilaginous basket," and is a firm but elastic framework of cartilage, perforated by numerous wide interstices, in addition to the seven on each side for the gill openings, which are then seen, each surrounded by its own cartilaginous ring. The basket is suspended by about seven pairs of cartilages to the fore parts of the spinal chord, and occupies most of the diameter of the fish. Their cartilaginous plates exist in the fibrous sheath of the spinal chord itself, and a broad, heart-shaped cartilaginous plate of the skull covers the suctorial mouth, and various cartilaginous processes supports the large "tooth-bearing tongue." If we place the creature in spirits the teeth readily flake off in cap-shaped layers, leaving a comparatively soft conical nucleus, and furnishing, as Mr. J. Hamilton stated to a few scientific friends around the tank, abundance evidence of the *muco-dermoid* origin of these organs in the *Dermopteres*. It is also Mr. Hamilton's opinion that the labial, palatine and lingual teeth of the different *Petromyzontids* supply the generic characters of the various groups that compose this most interesting family. The eye of this fish is provided with a wonderful array of muscles for affecting its various movements, and the membranous vestibule connected with the organs of hearing is well worthy a careful examination by the student and in fact the whole acostical arrangement is interesting from its peculiar homology to that of some of the crustaceous or cephalopode molluscs.

Some members of this family pass through a change similar to that of the tadpole. If the roe is watched until hatched, and preserved until the following year, the transformation can be seen, and in ten days the adults and and complete fish is produced. There is no increase of size, but in that time the respiratory pharnygeal tube is formed, teeth are evolved, the valve or velum in the mouth disappears, the intestinal canal is sensibly obliterated, and the roe, which was previously transparent, becomes opaque. The eye does not appear until more than six weeks have ensued after hatching, it being buried beneath the skin during this interval. The sea or salt water Lamprey is much more common, and resemble our common eel in many ways. At a recent dinner this fish honored the head of the table, and when properly served deserves its reputation, that of being so choice that Henry I. died from his love of it. In the spring they are the finest, and should be drowned in Gretan wine, a nutmeg placed in the mouth, a clove in each gill opening, then rolled spirally in the flour of filbert nuts and crumbs of bread mixed with oil, spices and Cretan wine, and finally boiled carefully in a cloth, and you have a dish in reality fit for a king.

In the small tanks a daily performance is going on that is quite interesting in the way of an increase, by the budding process of the sea ammonies. Minute atoms of red matter can be seen in all stages of separation from the mother base, and in a day or two delicate hair-like tentaculæ will be seen moving to and fro in their infantile attempts at producing circulation, and in a short space of time we have a full-fledged *actinia*. Hundreds of these creatures are being produced daily, and will well repay the visitor for a close scrutiny. Among other curiosities are some of the snakes(?) that formed a part of the last 'shower of reptiles in North Carolina." They are small, hair-like animals, undoubtedly a parasitic worm infesting streams and ponds, and could be easily caught up by a strong wind, although their vast numbers are unaccountable. Mr. Roberts has found them in the viscera of common striped bass, and they probably infest many of the fresh water fish, and those of migratory habits. A. P. C.

ABSTRACT OF THE THIRD ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF MINNESOTA.

THE report opens with an acknowledgement to various citizens and railway corporations for courtesies extended in the way of transportation, etc., partly the result of a growing interest in and appreciation of the value of fish culture, a healthy and natural outcome of the diffusion of information upon the subject of pisciculture.

The bounty of 400,000 salmon eggs furnished the State by United States Fish Commissioner Baird was divided between the hatching-houses of Mr. S. S. Watkins, of Red Wing, and that of Mr. Wm. Schermuly, on the St. Croix above Stillwater. Eighty per cent. of them were hatched in good order, and the distribution extended from early in May to the middle of June, at which time a succession of violent and deluging rains fell. The trout ponds of Mr. Watkins were badly damaged, causing the loss of many fish, both of his own trout stock and some of the State salmon. A few days later the establishment of Mr. Schermuly was utterly swept into the St. Croix river by another one of those storms, more like a "water spout" than anything else. He lost his entire stock of trout, old breeders and young fry, of which there were several hundred thousand, together with all the remaining State salmon, were carried into the St. Croix river, and, although not destroyed or totally lost to the public, they are not at all so *generally* distributed, or where the Commissioners or Mr. Schermuly intended to locate them.

Although the Commissioners endeavored to distribute impartially the fish remaining at Red Wing, they were compelled to disappoint some living at distant points. The fish by this time being so large that but few at a time could be risked in a can, for long distances, in such warm weather as it was then getting to be.

One hundred thousand white-fish were to have been received from Michigan in the spring, but at the time they should have been removed the streams and lakes in Minnesota were under ice from twenty four to thirty inches thick, and the result of putting them under ice would probably have resulted in the young fish starving to death for want of proper food. Had the State its own hatching-houses this could be avoided another season, as the temperature could be so regulated as to advance or retreat the hatching time at will.

The Commissioners received 10,000 of the land-locked salmon eggs from United States Fish Commissioner Baird, but unfortunately were not able to distribute any of them, for soon after hatching they were attacked with some fatal malady which seemed to paralyze the hinder part, and notwithstanding all efforts to save them continued to die rapidly, till only a few of the lot remained, perhaps only a dozen.

However much the Commissioners would like to introduce bass, carp, lake trout, grayling, brook trout, eels, walleyed pike, and others, their means is only barely sufficient to care for *part* of the gratuitously-furnished eggs from the United States Commissioner, but they hope that all of the above varieties may, before long, be introduced throughout the entire State wherever there is suitable water for them.

The appropriation made by the Minnesota Legislature ($1,000) appears to have been entirely inadequate for the purposes intended, and in thanking the Governor for his kindness in coming to their assistance with a donation from his sinking fund the Commissioners urge that an appropriation of at least $5,000 for two years be granted to enable them to continue the work in a manner suited to the magnitude of the interest and the dignity of the State. They have now on hand some 300,000 young salmon to be fed and cared for until next May, and then distributed, and to do all this they have unexpended some sixty dollars. They represent, and very justly, that their own labors and efforts are entitled to some consideration. No Fish Commissioner of Minnesota has ever received any compensation, and the labor performed by them has never fallen to the lot of the Commissioners of any other State. They have traveled hundreds of miles, caring for and attending the fish, carrying water, chopping ice, loading and unloading the heavy cans in and out of cars and wagons—night and day, early and late, wet and dry—but mostly *wet* and with ice water. During the last summer the Commissioners have averaged six weeks each of traveling and real hard labor, which time, taken from their own private business, was no small sacrifice. The clerical labor is very considerable, the correspondence being large; but much of it might be avoided if a small pamphlet could be compiled giving detailed instructions in fish raising; that would cover more ground than could possibly be contained within the limits of a letter. The Commissioners hear of the vigorous appearance and growth of the salmon introduced in widely separated localities, and believe they will all flourish and propagate. They have a reserve of about fifty California salmon, kept in a spring pond at Red Wing hatching-house, of the eggs received in the fall of 1874; from their actions this fall it was discovered they were apparently getting ready to spawn. Upon examination, however, it was discovered, also, much to their disappointment, that they were all males. Mr. Watkins, however, was equal to the emergency, and used the ripe males, and successfully impregnated a lot of brook trout eggs.

This, they think, conclusively demonstrates that the California salmon will undoubtedly breed in their lakes, and his vigor and rapid growth shows, also, that he finds plenty of suitable food and is able to care for himself.

CARE OF YOUNG TROUT IN THE HATCHING-HOUSE.

NUMBER ELEVEN.

Continued from our issue of Feb. 14th.

THE fish must now be sustained for two months, by artificial food similar in nature to that sought by, trout in their native retreats. In the cool, tortuous, swirling streams of the deep forest shades, where they luxuriate exclusively upon natures bounties—they are strictly carnivorous, subsisting upon flies, larvæ, and a great variety of other insects—when, if unmolested, they attain splendid proportions. The domesticated trout, which fish culturists have achieved such wonderful success in cultivating, takes kindly to many varieties of animal food. The hearts, kidneys, and livers of animals, brought to the shambles, chopped fine, and reduced to pulp by washing through fine sieves, say twenty-five to thirty tined wires to the inch, into a vessel of water, turning off the supernatant liquid before using. This food is well adapted to the fry, in its present condition. It can be best distributed by the use of a bulb syringe, by drawing into it a small quantity of pulp; the workmen begins at the upper end of the troughs, and gently forces out a single drop, and the minute fragments at once diffuse in the water, and are eagerly seized, and when all has been eaten more is injected, until the fish have eaten enough. In like manner the fish in troughs and in trays are daily fed in the morning, and while yet, light is sufficient, to enable the fry to see the food in the afternoon. Some fish farmers use curds, and hard boiled yolks of eggs. At the Storm Outfield Hatchery, in Scotland, bread crumbs and boiled liver are used, the latter made very fine by chopping with cleavers of butchers or cutting machines. Animal food is also used at the great French fish farms at Huningue, now possessed by the Germans, and at the pisicultural establishment at Buisse, in the Canton of Voiron, in Isere, a department on the southeast frontier of France. In Germany the dead animals, from the farms around the hatcheries, are obtained and patties or pies are made of their flesh, and fed to the fish from time to time. We can conceive that the flesh of superannuated horses, in good condition, slaughtered and prepared, would not only furnish wholesome and desirable food, but cheap withal. The flesh of many varieties of fish, well chopped, is eaten with avidity by trout. It is also economical, to breed small fishes, for those large enough to eat them. Doctor Goldsmith, of Vermont, avers that he feeds food prepared from Indian meal, which is eagerly eaten by trout, and they seem to thrive excellently well upon this farinaceous diet. It is quite probable that crumbs from the table, pulverized crackers and other refuse, devoid of condiments, may be utilized for fish food, and the fish be glad of the change. All such articles should be fed sparingly, that all may be eaten, if preferred at all by the fry. In the daily use of food, artificially prepared, it requires a great amount of patience to feed and nurse fifty or a hundred thousand trout, and keep the troughs pure and sweet by frequent cleansing. In a cold, damp, cheerless, uncomfortable hatching-house, assistants may be tempted to rush and hurry over their work, but the successful issue of the enterprise requires that such employees should be supplanted by more faithful and reliable helpers. After feeding the fishes a few days, the troughs should be thoroughly cleansed, at least every three or four days, from any decomposing food that may have settled upon the bottoms. The operator may turn on at the head of the troughs as strong a current of water as the fishes can bear, and slacken the force if need be, by placing the hand in the water at the head of trough, in which case the fishes flee down to the screen. By slowly stirring the gravel with the hand, avoiding violent motion while cleansing the upper end of the trough, then changing to the lower end, the fishes meantime fleeing to the upper end again; the operators completes in like manner the cleansing of a compartment of the trough or tray, and so on, until all of the nursery trays and troughs have been all renovated. Any substances that still remain may be rubbed through, or may be removed by the bulb-syringe. Thus has been described the daily routine—business of the fish farmer—until the time for the removal of the fry to a more expansive and commodious home, or for stocking waters. This period of time has usually been fixed at the end of two months from hatching, but it is still a mooted question. At this time, when nearly two-thirds of the States of the Union are laudably engaged in restocking the barren streams of the country, experiments should be instituted to determine at what age fry suffer the least shrinkage from prodaceous fish, when used in restocking streams. Artificial hatching has triumphed over the natural method by a loss of only five to ten per cent. But how shall the immense loss of young fish be lessened, that fish culture may rank as the greatest achievement of the age? It is feared that the great outlay of money and of labor by the different States, and by the United States Fish Commission, have not produced results commensurate with the means employed. Yet, in all cases, the work has been conducted on as safe a basis as the present state of our knowledge permits. Are the young salmon, trout and white fish, transferred to the public waters before they are fully equipped for shunning their enemies, or before they are entirely capable of maintaining an independent existence? Are these fish planted in too large numbers at once, and at unseasonable times? Are they so nearly exhausted in being carried long distances, that few of them rally from feebleness incident to the present modes of transportation? A belief is rapidly gaining ground among many pisciculturists of our country, that young fish used for stocking public waters are removed too soon from the breeding establishments; that they should be retained longer, in large tanks or ponds, before they are planted; that improved methods of transportation should be employed; that cars more capacious and roomy should be fitted especially for this service, with large tanks, and improved apparatus for constant and rapid aeration of the water; that these fish trains should have no other business for the time but the transportation of fish, and should be under the control of experienced officials, State Commissioners or others, who know exactly what kind of treatment to bestow upon feeble young fish while in transit to their new homes. More than this, the train should be fitted for the comfort of men employed, so that two sets may labor alternately for the security and safe conveyance of the many thousands committed to their care. Stations where pure water may be had in abundance, should be carefully designated before setting out, and the conveying be conducted rapidly or slowly as best secures the safe transportation of the precious freight. The night time should always be selected for planting, which should be in the small tributaries of larger streams, where the fry may become accustomed to the extraordinary scope and freedom of their new quarters, and gain wisdom as well as strength, which will better enable them to avoid their natural enemies. If the fry are disposed to remain for a time in the new situation, a smaller number will be sacrificed than if planted at once in larger streams, where a greater number of predatory fish abound. It is a common practice to plant even a hundred thousand at a time, *en masse*. This immense shoal of feeble, deunlisted fishes, rendered more so by a long tedious journey, incapable of endurance if too young—from imperfect gills so necessary to support respiration—at once become a prey to thieves and sharks, that lurk for no other purpose than to gobble up thousands of these incipient trout and salmon, incapable as they are of hiding or fleeing from the presence of such irrepressible and formidable foes.

Occasionally the fish culturist is horrified by the sudden appearance of an epidemic among his fishes. They may appear in perfect health in the evening, and in the morning the screens between the compartments of the troughs are clogged with numbers of dead and dying fry. Immediate action becomes necessary for the safety of those apparently healthy and uncontaminated by disease. Unless the morbid cause can at once be detected, instant removal to the pond is the only safe expedient to adopt, while the origin of the malady may be investigated at leisure, thus guarding against a similar misfortune, if the cause was found to exist in the confined space of the troughs, or a fault of some unseen element of the water flowing through the troughs. It will be seen thus far, in describing the processes of this wonderful art, that none but thorough men win the highest prizes. The experienced and adept fish farmer must, like the successful breeder of blooded stock, possess a thorough knowledge of his business. The same industry is requisite in growing fish successfully, as in rearing kine. The successful man of business, whose

thrift has all been gained by hard knocks, would make an excellent fish-farmer. Eternal vigilance in any calling, only plucks the golden fruit. This great industry, it must be admitted, is only in its infancy. As the masses become better acquainted with its object as a great public benefaction, and enlightened men become more interested in the science, it will occupy a higher place, as a measure contemplated and adapted to increase the food resources of our country; its advocates will work together more harmoniously and earnestly for its fullest development. The art of propagating many more of the different species of food fishes is yet to be attained by a more thorough study of their habits and characteristics. Many of the ocean fishes of great value for food are annually shrinking in numbers and value, and it is the office of fish culture to ascertain if these cannot be increased by some mode yet to be developed. The vast harvests of the sea, like the long used lands of the agriculturists, are perceptibly diminishing. Is it not the province of this wonderful art to attempt some method of increasing those vast stores of human food? NAHUM E. BALLOU, M. D.

Sandwich, Illinois.

FISH CULTURE IN TENNESSEE.—Mr. Geo. F. Akers, one of the few really successful fish culturists in the South, has addressed a letter in reply to an inquiry from State Representative W. N. Cowden, for information as to the adaptability of Tennessee waters to Fish Culture, in which he says:—

"On the subject of fish and their culture in Tennessee, the adaptability of our streams and climate to their production, and the possibility of resupplying our streams with their primitive abundance, I will say that the waters and climate of our State are as favorable to fish culture as any I know in the Union. Our rivers, lakes and rivulets are generally clear, pure and sufficiently cool for the healthful and rapid rearing of the best varieties of game fish. They leap from the hills and mountains in beauty and gladness, and make their way through valleys and plains, the most attractive and fertile in America. I regret to say the most of them have been despoiled of their finny treasures, by their ruthless and unnecessary slaughter by lazy sportsmen and pot-hunters, who use the net, trap, seine, gun, gig, spike, and every conceivable destructive means of killing. This is not generally for prudent and exhilarating sport—or for profit; but from an unrelenting propensity, which seems to be natural with those who engage in it, without reference to present uses or to future supply. In this way it has come that few of our streams, especially in Middle and West Tennessee, have sufficient in them, either to supply our tables or to reward the exertions of the eager and industrious angler.

I would, therefore, suggest the passage of a law securely protecting the fishes in all the waters of Tennessee—the appointment of a Fish Commission of three persons, and the establishment of, say, three or more hatching-houses, for the artificial propagation of fish. The duties of the Commissioners should require them to see to the faithful execution of the protection laws, to distribute fish from the hatching-houses to streams that are deficient, and see that it is properly performed and applied."

—The Senate of Florida has appointed a Committee on Fisheries. We await its report with interest. The waters of Florida along its 1,200 mile coast line yield products as valuable as its lands.

TRANSPLANTING LOBSTERS.—Living lobsters for some years have been brought to England from Scandinavia, and form a profitable branch of trade to a few vessels. One of the Allan steamers sailing from Portland a few days ago, had on board a huge tank full of living lobsters. The tank was constantly supplied with water by a donkey engine, while the sluices carried away the overflow. The only danger to the living cargo anticipated was the warm water of the Gulf Stream, whose effect was not known. The Scandinavian traders have a different cause of fear. After a thunderstorm, it is said, the lobsters are clawless, many of them lifeless, and all very considerably damaged in different ways, whether from fright or other causes is not known. If this Portland venture turns out to be successful there will be a new field opened for a trade from Novia Scotia, or more particularly Newfoundland, whose coasts are literally alive with lobsters.—*Montreal Witness.*

THE OREGON FISHERIES.—There are twenty-six canneries on the Lower Columbia river, and one at the Lower Cascade on the same river. These canneries have a capacity of twenty-five thousand cases annually each, a grand total for the twenty-six canneries of 675,000 cases which, at $5 per case, makes a sum total annually of $3,375,000. To prevent extermination of the salmon provisions should at once be made to propagate the fish artificially, and Congress has been asked to appropriate $25,000 to start a salmon nursery, and $10,000 thereafter annually to maintain it. The annual revenue from the fisheries, when run in their fullest capacity, is about equal to the wheat crop of the State.—*Pacific Life.*

Natural History.

THE AMERICAN GOLDEN PLOVER.

BY MARTIN A. HOWELL, JR.

THROUGHOUT the whole extent of our country over which this interesting bird ranges, there appears to be none which creates more general confusion among shooters than this, the common Golden Plover, *Charadrius marmoratus,** of Audubon. No bird on our list seems to be more generally known, for it is scattered apparently over the whole face of the land—from the fur countries to the Gulf, and from ocean to ocean. Though not numerous in the older States of the east, probably from the greater scarcity of its principal fare, the grasshopper, throughout the unlimited tracts of prairie, plain and pasture of the Western States, as far as the Rocky Mountains, it is found in countless thousands, more particularly during its pilgrimages to its breeding grounds in the north.

In Kansas, Nebraska, and the wide extent of plain west of the Mississippi, where the grasshopper becomes a scourge to the restless pioneer, these birds are at home. Here they can be found in all their glory; here, until the eye wearies with the monotony, their well-filled batallions can be seen sweeping over the country in their journeyings, gathering in a harvest of the pests which have become such a scourge to the hardy cultivators of this land of promise. This locality is thus held with the same apparent tenacity by the Golden Plover as the great mast region of our heavily timbered country is held by the common wild pigeon of America.

This bird arrives in our locality about the middle of April, on its northerly passage, generally at the same time, although not mingled with the Pectoral Sandpiper, the most numerous of the sandpipers of the western migratory tract, and is among the last to remain with us until the season of incubation hurries the rear guard of the advancing swarm northward. On the arrival of their columns the birds appear in their late winter plumage, ash color as to the lower parts, while the upper are brownish black, marked with those bright yellow or golden spots, so characteristic of the bird, and from which comes its name, "Golden."

Even as the advance guard passes along, not having as yet discarded their winter dress, there appear a few in the same flock, who, as though forcing the season, seem more inclined to throw off their garb of winter, and are to be seen in various stages of advancement, for instead of the dull ash color of the lower plumage there appear black spots of irregular shape, giving the whole a mottled appearance, first a brownish gray, then changing to grayish black; finally, losing the gray entirely, the black predominates, until the throat cheeks, and then the whole of the breast becomes a rich black color. The tardiness of many in the same flock in assuming the plumage of the season of incubation, and the finding of many at the same time in the various stages of plumage, has led observers into error as to the true character of the bird, and has induced many to believe, and persistently too, that those more advanced were the Black Breasted Plover, *Charadrius helveticus*, a distinct species, and a bird of greater rarity in this country. The latter is by far the larger of the two, and cannot be mistaken after comparison. It is known generally by those who have shot it, as the "Beetle Head," "Bull Head Plover," "Gray Lapwing" or "Swiss Plover." And yet it is not uncommon to hear *old sports* call the common Golden Plover, —when they happen to bag one well advanced in its spring plumage—a "Bull Head or Black Bellied Plover," which is rather strong presumptive proof that they have never met the true Black Bellied Plover face to face. Among the thousands which came to Chicago in the spring of '74, when the writer was watching the market for specimens of game birds, he failed to find a single specimen of the true *Charadrius helveticus*, though he was on the market early every morning as the game came in from every point of the compass by the various railroad lines which center there

The measurement of an adult bird of the *C. marmoratus* is 10½ inches from bill to tail, and the length of the bill 1¾ inches, while the *C. helveticus* measures 12 inches in the adult, and the bill 1 5-16, much heavier proportionately, and the yellow or golden spots, so characteristic in the *marmoratus*, are wholly wanting in this bird.

Though naturally timid, and usually very shy of the approach of man, these birds are easily reached, provided the proper precautions are used by the hunters, who generally resort to the more convenient means of a wagon, from which they carry on a wholesale slaughter into their well-stocked ranks; and from the apparent inattention which is usually paid to their enemies thus equipped, it would seem that their fear of humanity is limited to man in his primitive condition only, for after volley upon volley has been poured into their ranks with deadly effect, each shot leaving its score or more dead and wounded, they pass along in unbroken line only to receive another cross fire in their next circuit of flight, as they pass over a favorite feeding place, of newly plowed ground, or in a grasshopper range.

In the autumn, and more particularly after a protracted drouth, to which the vast tracts of prairie or plain of the West is subject at this season; and when the many ponds and sloughs are dry, these birds, after a day spent upon the newly plowed lands, resort regularly to the sand bars of the nearest streams for the purpose of sanding, washing and quenching their thirst.

On the Kankakee, and on the upper Illinois, below the Kickapoo Rapids, where the bars and shallows are frequent in dry weather, the writer has seen them come in thousands towards the close of the day and in the early morning, each flock making a *bee line* for its favorite sand bar, and as the distance shortened their notes gave the strongest proof of the pleasure anticipated in the enjoyment of a wash in the clear waters of their oft frequented spots. To one lying in wait for these birds the music of the approaching flocks is one of the episodes of a sportsman's life.

As the flock heaves in sight, coming from the direction of the north or south prairies, a shrill whistle is usually the first welcome, then the chorus of a hundred voices chimes in as though rejoicing at the sight of the liquid element. Such is their apparent extacy as they wheel around over their favorite bar, and such their utter disregard of the heavy booming of guns that hundreds are dropped upon the water fluttering in every direction, while the column wheels into line again right over the spot where its dead and wounded companions lie only to be thinned again and again, until finally driven away. Ordinary precautions seem forgotten or abandoned by these birds when thus approaching a favorite watering place, and when met with under such circumstances it is conclusive evidence that these birds have not been long from the breeding grounds, and that most of them are young and inexperienced birds.

On one occasion, upon a bar in the Illinois, the writer shot 88 in one evening.

It is at this season that this bird becomes so exceedingly fat. Excessively would probably convey a more correct idea of its condition for after a season with the grasshoppers, and the worms picked up upon the newly plowed fields in the fall, such is the load of fat carried by these birds that in falling from any ordinary height, upon hard ground, the breasts bursts with its delicious load. And often while handling or plucking them the hands become covered with oil from the bird.

From the regularity of the visits of these birds, in former years, to the sand bars of the upper Illinois and Kankakee they have been called by the resident shooters Kankakee Bar Plover, in that locality. And from the great numbers which sweep over the prairies in spring and fall they have for years passed under the common name of Prairie Pigeons among the graugers and those not up in *birdology.*

Streator, Ill., January 24th, 1877.

Charadrius fulvus var. *virginicus* Coues.—ED.

CATALOGUE OF THE BIRDS OF WEBSTER, N. H., AND ADJOINING TOWNS.

BY CHARLES F. GOODHUE.

Continued from our last issue.

AMPELIDÆ—THE WAXWINGS.

Ampelis garulus. Bohemian waxwing. Exceedingly rare winter visitor from the north.

Ampelis cedrorum. Cedar bird. Common in summer; have not seen it in winter.

LANIDÆ—THE SHRIKES.

Collurio borealis. Great northern shrike. Winter visitor. For courage and ferocity, this bird is unequalled. I have seen them attack blue jays and robins, but were unable to master them. I once saw a shrike pounce upon a flock of snow buntings and kill and carry off one before I could stop him.

TANAGRIDÆ—THE TANAGERS.

Pyranga rubra. Scarlet tanager. Common summer resident; breeds.

Pyranga æstiva. Summer redbird. Exceedingly rare; have seen but one.

FRINGILLIDÆ—THE FINCHES, SPARROWS, ETC.

Pinicola Canadensis. Pine grosbeak. An irregular winter visitor, common in the winters of 1874 and 1875; have not seen any this winter.

Carpodacus purpureus. Purple finch. Common in summer; have not seen it in winter.

Astragalinus tristis. Goldfinch. Common in summer; a few winter.

Chrysomitris pinus. Pine finch. A few found in winter.

Ægiothus linarius. Lesser red poll linnet. Irregular winter visitor; there are thousands here sometimes; not one to be found this winter.

Curvirostra Americana. Red crossbill. Sometimes common; a few breed in the large woods.

Curvirostra leucoptera. White-winged crossbill. Probably occurs in winter, but have not taken it as yet.

Plectrophanes nivalis. Snow bunting. Common winter visitor, more so in some seasons than others.

Poœcetes gramineus. Bay-winged sparrow. Common summer resident. The most common of the sparrows; breeds.

Coturniculus passerinus. Yellow-winged sparrow. Not a common summer resident; may breed.

Coturniculus Henslowii. Henslow's sparrow. Not common in summer; breeds. Always found in swampy places. The male has a song like the syllable "see-wick," which he keeps up for an hour at a time.

Zonotrichia leucophrys. White-crowned sparrow. Common spring and autumn migrant.

Zonotrichia leucophrys. White throated sparrow. Common migrant; a large number stay through the summer on Kearsarge Mountain, and rear their young there.

Junco hyemalis. Brown snowbird. Abundant migrant; found one nest in Webster. Breeds on the mountain in great abundance; have found four nests on an acre of ground; the nest is usually placed under an over-hanging rock or in a hole, so as to have a covering over it.

Spizella monticola. Tree sparrow. Common in winter; more so in spring and fall.

Spizella socialis. Chipping sparrow. Abundant summer resident; breeds.

Spizella pusilla. Field sparrow. Common in summer; breeds, nesting in low bushes sometimes on the ground, but not often.

Melospiza melodia. Song sparrow. Common summer resident, comes earlier and stays later than any of the summer sparrows.

Melospiza palustris. Swamp sparrow. Common in summer; frequent busy swamps where it breeds.

Melospiza Lincolnii. Lincolns sparrow. Very rare, have taken it but twice in the springs, of 1874 and 1875, have seen one or two others.

Passerella iliaca. Fox-colored sparrow. Common in migration.

Guerrea ludoviciana. Rose-breasted grosbeak. Not common here but is on the mountain; probably breeds.

Cyanospiza cyanea. Indigo bird. Common summer resident; breeds.

Pipilo erythrophthalmus. Towhee bunting. Common in summer. Breeds, nesting on the ground.

IDENTITY OF BLACK BASS.

EDITOR FOREST AND STREAM.—In a former letter on the black bass question, I said I had never seen in either the Lake George or Hudson river bass, the double curve at the terminus of the lateral line, which mark is said to be a distinguishing mark of the black bass proper. I inclose a picture of a bass caught last December, in Ballston Lake, by Mr. J. W. Gaffney, of Saratoga Springs. You will see that the double curve is well defined. Both Mr. G. and Mr. John McBride Davidson, assure me that the Ballston Lake bass are simon pure, black bass. Will "Dexter" please state if the double curve is present in the Mohawk river bass? I hope, during the coming summer, to send you samples of bass from different waters about here, that their identity may be established. Light is certainly needed upon this subject.

Yours truly, GLENS FALLS.

EYELESS FISH.

POTTSVILLE, Pa., Feb. 19th.

EDITOR FOREST AND STREAM:—The other day a party had on exhibition a lot of eyeless fish, consisting of shiners, pickerel and others. We have heard and read of eyeless fish, but have never before gazed upon such a phenomenon, which caused us to pause and to seriously contemplate the scene. We neglected to question from whence they came, but suppose they must have been discovered in a subterranean pond beneath some swamp; if true, Mammoth Cave no longer has a monopoly for eyeless fish. DOM PEDRO.

THE BUTCHER BIRD ONCE MORE.—Among the many interesting notes called forth by our recent remarks on this species, is the following account from our Longwood, Fla., correspondent "F. L. R." Speaking of the southern species of shrike (*Collurio ludovicianus*), he says:—

"It is known throughout the south as Butcher Bird, or French Mocking Bird; the first from its habit of impaling its food on thorns, etc., and the second name from its notes, which are, during the spring and summer, very sweet, but limited in their range. I have frequently seen in Texas the thorns of the mesquite (*Algorobia glandulosa* and the locust (*G. triacanthus*) filled with a great variety of insects and small animals, such as field mice, or young snakes and lizards. On one occasion I was removing an old house, and three of these birds took positions at convenient distances, from which they descended on every moving thing that showed itself, frequently coming almost under my feet in quest of a mouse or roach, with which they decorated a small locust that grew near at hand. They are very numerous here, and very tame also, seeming to have little or no fear of a human being. I have frequently driven them out of my back porch, where they were help-

ing themselves to my fresh beef. To this last performance the common red headed woodpecker is very much addicted, often showing a strong disposition to resist your efforts to protect your property."

DOMESTICATED WILD GEESE.—A correspondent sends us the following interesting note:—

"The theory advanced by several of your correspondents about domesticating wild geese holds good. Several years ago a citizen residing near Rockville, this county, captured in the fall of the year a male and female wild goose, and for a time kept them in confinement In the spring they took "French leave," and the owner presumed he was minus a pair of geese. Next fall the mother returned with a flock of twelve or fourteen fine young geese, which remained by her side until all were captured. The mother was then allowed to depart, but never returned, having most likely been shot. "AUDUBON."

THE WAXWING.—*Minneapolis, Minn., Feb.*, 22d, 1877.—*Ampelis garrulus*, Linn., or the Waxwing, a winter visitant here is so inconstant, appearing as last winter, in large number-, and then failing to do so entirely for several successive winters, it has occurred to me that with your extended area of circulation you might make the inquiry, "Where has he been observed during the present winter?" the numerous answers to which may be in the solution of the problem of his migratory habits, hitherto essentially unanswered.

P. L. HATCH.

PRINTER'S ERRORS.—These are most vexatious to both author and editor; sometimes they are exasperating; sometimes they cause libel suits. Here is the complaint that one correspondent makes, it is altogether characteristic:—

PUTNAM, Conn., Feb. 22d, 1877.

EDITOR FOREST AND STREAM:—

I remember reading some time since in FOREST AND STREAM an editorial request to the effect, that correspondents be particular to *print* scientific names, terms, &c., to guard against mistakes by the compositor.

I am not very "nefty" in the use of scientific terms, but when I ventured to use a *pseudonym* and printed it *Clericus*, behold your "very cus" of a compositor made my "..lericus" to read O'Vericus, which on the whole, I rather think an improvement, and shall adopt it "until future ages shall have discovered the right." Hoping you will not think me a "Sassacus," though I may be a "Rusticus," I rest yours to serve,

A. A. M.

P. S.—Clericus *does* look like O'Vericus; at any rate it's all the same to Americus, (a merry cuss). O. V.

Still another injured author writes what follows: and we are fain to say that the explanation shows that the printer's error has evoked some unfortunate criticism upon the head of Rusticus, which are the harder to bear because he is not to blame:

PORT ROYAL, S. C., Feb. 22.

Among a few unimportant misprints—easily noticed and corrected by the intelligent reader—in my little history published in your issue of the 15th inst., occurs one which simply negatives the rest of the statement. For "The Linnell Bros. surpassed," the reader will please substitute "The Linnell Bros. witnessed, &c. By making this correction you will add to the obligations of RUSTICUS.

Woodland, Farm and Garden.

PALMS.—Palms have now become universal favorites, and their popularity is such that they are no longer confined to extensive collections in large horticultural and botanical establishments, but have been introduced to decorate and enliven the parlors and drawing-rooms of our city and country homes.

There is a strongly marked individuality about this order of plants which strikes even the ordinary observer, and the effect produced is all the more heightened when large and small specimens of the various species are grouped together, and also when they are associated with *Tree Ferns, Cycads, Bananas, Marantas, Caladiums*, and other plants of a tropical character. Their symmetrical appearance, their fan-shaped or primate leaves, the charming shades of green which they assume, the graceful curve of the leaf stalks, the rugged, often prickly, appearance, of the stems, the development of the flowering process on a spadix, their intrinsic value and durability, all combine to raise them in public estimation, and stamp them among the most noble as well as ornamental of the vegetable kingdom. They are of early culture compared with many plants of less value; yet to preserve healthy, well developed specimens, care and attention are requisite. The soil should consist of free fibrous loam, as large a proportion of fibre being left as practicable, inasmuch as the mass will thereby take longer to get decomposed, and yet exhausted will form a better rooting medium. Keep more porous, and thereby enable the cultivator to keep the roots within limit, and thus make the plants more rigid and better suited for home decoration. Water should be freely given, and a good margin or basin be allowed therefor, the indispensable condition of success in Palm growing being good drainage, abundance of water at the root, and plenty of moisture in the atmosphere. If they are stunted as regards water supply during their period of activity the foliage, instead of wearing that freshness and lustre so pleasing to the eye, speedily assumes a parched and sallow hue, the growth receives a severe check, the leaves are stunted, and the chances are that the plant never recovers its pristine vigor. Another and most essential provision with reference to health and color is shading from the bright sunlight. During our hot, burning summers, if the greenhouse is shaded, either by painting the glass with a thin coating of white lead and turpentine (that it may be easily rubbed off in the fall) or by temporary screens, the evaporation is reduced, and a moist growing atmosphere is easily retained, provided the syringe or hose is applied daily. Cleanliness, of course, is absolutely necessary. Scale and Thrip are their greatest enemies, and must be watched incessantly. Plants in which the growth has been solidified by a due admission of light and air will winter in a minimum temperature of 45°, but where they are intermixed with a miscellaneous assortment it is advisable not to let it fall below 50°.

Several of the more hardy varieties, such as the Sago and Date Palms, the Palmetto, etc., are now much used as single specimens on leaves, or for groups in the pleasure grounds, giving quite a sub-tropical aspect to the surroundings, while for jardinieres and window boxes, for halls, churches, or parlor groups, they are found indispensable, lending to all a lightness and grace that can be supplied by no other plants. They have also made their mark for table decoration, and no arrangement looks more lovely or graceful than a pair of nicely matched Palms for end pieces on a dinner or supper table, and a graceful March stand with its tall, trumpet-shaped vase for the centre pieces. The following are the most hardy, useful, and cheapest of the genus:—

Leaves fan-shaped—*Chamærops excelsa, C. humilis*, and *C. fortuna, Corypha australis, Latania Bordonica*, and *L. rubra, Livingstonia rotundifolia, Thrinax argentea* and *T. elegans*. Leaves pinnate—*Phœnix dactylifera* and *P. sylvestris, Areca verschaffeltii, A. lutescens* and *A. rubra, Seaforthea elegans, Euterpe edule*, Pritchardia filamentosa, Wellia regia, and Kentia Canterburyana.

THE CHICAGO POULTRY SHOW.—From our Chicago correspondent we receive the following account of the annual poultry show now in progress in that city:—

"The poultry show, so far, has been a very successful one, the attendance being large and the entries more numerous than last year. They number nearly 1,200, and leave but little of the immense coop now unoccupied. The breeds shown are great in variety. The chickens on exhibition embrace seventy-three varieties. There are twenty different kinds of pigeons and several varieties of rabbits. The show is in every respect much better than last year. The exhibitors are from every part of the country. Mr. W. H. Todd, of Vermillion, Ohio, has made 160 entries, including a great variety of chickens, ducks, pigeons and geese. His Chinese geese fill the exposition building with their unearthly squawk. Dr. Enos, of Milwaukee, has a very fine lot of fowls on exhibition. A great many other prominent exhibitors are represented. The visitor sees a great number of fine birds. Some fine black Cochins are seen, many of which, especially the males, are very handsome. C. J. Ward, of Chicago, and W. H. Todd, of Ohio, are the principal exhibitors of this kind of fowl. The display of partridge Cochins is very fine, and attract much attention, Dr. Horne, of Janesville, Wisconsin, has several which he values at $75 a pair. The buff Conchins are well represented and are the most handsome bird in the show, being very large and of a golden hue.

There is a large variety of game cocks on exhibition; some very fine ones. The speckled Houdans attract the attention of all visitors by reason of their singular appearance. Todd, of Ohio, makes the principal exhibit. The display of black Spanish is large and fine. There are sixty coops of them. Mr. Todd, of Ohio, exhibits what he thinks the largest goose in the world. It weighs thirty pounds. There are a great many other varieties of birds on exhibition noted for their hearty and good qualities.

The finest displays are made by Dr. Enos and S. H. Leaman, of Milwaukee, and W. H. Todd, of Vermillion, Ohio.

The show will last until Tuesday night of next week, and will be varied by a baby exhibition, which will prevail from 2 to 5 o'clock on Monday and Tuesday afternoons, headquarters to be the art gallery. To foster this branch of industry prizes will be given—a silver cup to the handsomest and healthiest infant, irrespective of sex, under eighteen months, and $10 in gold for the second prize. The show, so far, has been a success. ROVER.

THE BOSTON PINE.

MONTREAL, Canada, Feb. 21st. 1877.

EDITOR FOREST AND STREAM:—

Will you be kind enough, in the Answers to Correspondents of FOREST AND STREAM to tell me the specific name of the enclosed *Lycopodium*—that is to say, if you can do so from the very meagre and imperfect specimen (the best I can get, however,) which I send. It is imported to this country from the United States, in large quantities for Christmas decoration, and is sold here under the name of the "Boston Pine."

Also, can you tell me what Saskatoon berries are? They come from the western country, and the name is probably of Indian derivation. INQUIRER.

Undoubtedly Lycopodium complanatum var. Sabinæfolium, *Wild* (L. chamæcyparissus, *Braun*). The typical form is common in shady woods and among evergreens throughout New York, New Jersey and southward, while northward it passes gradually into the variety as above. The stems are creeping, with scattered, awl-shaped leaves, the branches erect and repeatedly forked, the branchlets in the variety being much narrower and more erect than in the type. Can our correspondent send a sample of the berries?—ED.

QUERY—*To Raise Lapagaria.*—How should I proceed to raise a few seedling Lapagerias?—ALPHA.

Sow in pots or pans filled with light soil; place them in a temperature of 60° to 65°, and keep them well watered. They will germinate in about a month, and will then not require so much water. Pot off singly as soon as the plants are fit to handle, and look carefully for thrip on them during the hot weather.—ED.

—Owing to the continued absence of rain, the supply of grapes was nearly as great at Christmas time in San Francisco as at the height of their season. Oranges from further south were plentiful, as were also other tropical fruits, such as bananas, pineapples, limes, etc. Strawberries were yet in market, and raspberries just passing away. Apples, pears, green peas, string beans, new potatoes, asparagus, sweet potatoes, and the usual winter vegetables were in abundance. One of the features of this market at midwinter is the prevalence of beautiful flowers Roses, pinks, violets, mignonette, fucias, heliotrope, pansies and geraniums, in bouquets, etc., are cheap and plentiful. The display is a horticultural exhibition in itself.

—Curtis & Cobb, seedsmen and florists, 11 Avon street, Boston, write, Feb. 22d:—

"We appreciate your department of Horticulture, that I invariably read carefully. It is an improvement on previous years, and trust it will do great good."

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus*.
Drum—two species. Family *Sciænidæ*.
Kingfish, *Menticirrus nebulosus*.
Sea Bass, *Sciænops ocellatus*.
Sheepshead, *Archosargus probatocephalus*.
Snapper, *Lutjanus caxys*.
Grouper, *Epinephelpus nigritus*.
Trout (black bass) *Centropristis atrarius*.
Striped bass or Rockfish, *Roccus lineatus*.
Turbotish, *Pomatomus saltatrix*.
Black Bass, *Micropterus salmoides; M. nigricans*.

FISH IN MARKET.—Notwithstanding the season of Lent prices of fish remain remarkably low owing to the abundance of the supply. Our quotations for the week are as follows:—Striped bass 20 to 25 cents per pound; smelts, 20 cents; bluefish, 15 cents; salmon (frozen), 30 cents; shad (southern), 75 cents each; mackerel, 30 cents; white perch, 15 cents; Spanish mackerel 75 cents; green turtle, 22 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 15 cents; haddock, 7 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 12 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 20 cents; turbott, 20 cents; scollops, $1.50 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; sunfish, 10 cents; yellow perch, 10 cents; salmon trout, 15 cents; hard shell crabs, $3.00 per 100; soft crabs $1.25 per dozen; red snappers, 15 cents per pound.

—All the Long Island spring ponds and their outlets are clear of ice, and anglers are hoping for propitious weather until the season opens on the 15th of March. Should no snow or severe weather occur, the streams will be in better condition for the rod than at any time within the memory of an old inhabitant.

FISHING RODS.—We have recently had the pleasure of examining a remarkably handsome combined Green heart and split bamboo rod, with German silver mountings, made for Mr. E R. Howes, of San Francisco, by Messrs. Conroy, Bissett & Mallison, of this city. This firm, as will be seen by their advertisement, are now making a specialty of this line of work, turning out split bamboo fly rods of a guaranteed quality, at prices far below anything at which they have previously been sold.

THE ORVIS FLIES.—Mr. Chas. F. Orvis, of Manchester, Vt., who makes most excellent Trout and Bass Rods, and an Improved Reel, as well, which is very much in request by anglers, has recently turned his attention to dressing artificial flies. Some specimens of his handicraft lie on our table before us. They com prise seven patterns of bass flies, in gaudy colors, and nine of trout flies; and we are bound to say that they ought to satisfy the most fastidious. One of the bass flies has its wings set after the Ferguson pattern; the others are flat. Three of the trout flies are new studies, which Mr. Orvis thinks are nearer to nature than the usual styles. He claims to dress his flies on best selected gut, and tie to any size of hook. One plan he adopts which all dealers would do well to imitate. He attaches to each kind of fly sold either the name of the fly, or a number, so that parties can duplicate their orders with certainty, and also learn the names of artificial flies, which many wish to do. Lest some persons may assert that Mr. Orvis is only a tyro in tying, and don't know as much about the art as some other men (which may, or may not be a fact,) we wish to say that we happen to know something of the effort and expense to which this persevering gentleman has put himself to acquire the requisite skill in the profession, and to add that if all persons undertaking a new business would take the same pains to qualify themselves, more general satisfaction would be enjoyed by purchasers. Mr. Orvis, in his far-off corner of New England, will be able to supply a local demand long felt, and to fill a void which it is possible (as the poem says) "the world could never fill."

—Messrs. Holberton & Beemer wish to call the attention of anglers to their splendid stock of trout and bass flies just received from Miss Sara J. McBride, of Caledonia; also a fine assortment of fly rods, from Thad. Norris, Leonard, and other makers.

THE OLD QUESTION—DO BLACK BASS TAKE THE FLY?

DETROIT, Feb. 17th, 1877.

EDITOR FOREST AND STREAM:—

"W. W. M.'s" article on "Angling for Black Bass" in your issue of the 15th leads me to give my local experience with the fly, hoping to aid in solving this question as to whether they "do or do not take" it.

This appears to be a much vexed question, and to arrive at a conclusion one way or the other we must know the habits of the fish, and conditions under which we seek them must be considered in their true relation. I have always thought my success or failure depended upon these conditions, and not upon the refusal of the fish to take a fly; for that would be an exception to the rule my experience has established in my own waters, and a rule has no

exceptions but only a modification of application to cover different conditions under which we see it.

Beginning with the opening of the black bass fishing, while they are yet in shallow water, my efforts to capture them with flies have been unsuccessful except in those places their habits then lead them to frequent; but whenever I have sought them in proper places with flies of right size and kind success was a rule, unless some condition of the water or an untimely hour of the day made the fish unable to see the fly, but able to see me too distinctly.

My experience in fly-fishing for bass has been confined almost entirely to the Hudson and Mohawk rivers, in vicinity of Troy, so must not be taken as an assertion that all waters are included in my views; but during seven or eight seasons' fishing in those waters with both bait and flies, including the "Dobson," which is undoubtedly the equal, if not the superior, of any bait for bass, my success has always been greatest with flies. These waters are not noted for the numbers or extraordinary size of their fish, but their "game" and "educational" qualities are beyond question, living as they do in the rapid rocky channels characteristics of the lower Mohawk and upper Hudson, and being constantly persecuted with all kinds of fishing apparatus.

In the early season, from June to last of August, my best success has been fishing in deep pools, or under shadow of dams and falls where the water is quieted a moment after its plunge, casting my flies into the tumbling waters and giving the current its own way with them, simply keeping them on the surface. In the later season, from middle of September to end of October; the bass seem to live more in rapid, deep currents well out in the stream where it is less disturbed by obstructions, lying in the eddies formed by boulders, etc., but if the water's surface is disturbed by winds, as is usual at that season, they are taken about as readily in mid-current, where the water is from two to three or four feet deep, and running over a pebbly bottom.

The non success of flies in bass fishing, it seems to me, arise more from faults in their size and color than in "lack of appreciation" in the fish; most of the bass flies sold by the trade generally have only a "local reputation," not applicable to all conditions arising from the varied haunts of this fish; and this fault cannot be corrected except by observations of the many conditions that arise.

In the waters most familiar to me flies of moderate size and subdued combinations gave best success; brown hackles tied on No. 6 Limerick, and brown and yellow flies tied on No. 6 or No. 10 hooks were always successful lures in low, clear water; for higher turbid water more gaudy flies were good, made of scarlet or red body, brown tail and wings, or with double wings, inner scarlet, outer brown, black hackle, tied on No. 4 hook. Of course the sizes apply only to my experience, as in the waters mentioned a half pound was an average weight, seldom reaching beyond a pound and a half. To compare relative success with fly against bait let me add an incident of one of my wadings. Having fished all the Mohawk cast and north of Cohoes, arrived at a dam near Waterford with a pool in which an old gentleman had "baited" its bass for two or three hours without a "nibble," as he said, and doubting that there was a fish in the river; quietly casting the flies into the upper edge of the pool three rises met them instantly, much to his surprise, and two half-pound bass were hooked and soon netted; a dozen casts in all, maybe, surely not more, and eight fine bass were lying in my basket much more to his surprise; and this pool was less than twenty feet wide and four deep.

Hoping this will be acceptable to you, and add a little to the solution of this "fish problem," I remain,

B. F. FLOWER, JR.

MOVEMENTS OF THE FISHING FLEET.—The delay in the arrival of the early Georges fleet leads to the impression that a scarcity of fish has been found upon Georges and that the vessels have resorted to the deep water fishery on LaHave Banks to complete their fares. The number of fishing arrivals the past week has been small, including 1 from Grand Banks, 5 from LaHave, 3 from Georges, and 1 from Grand Menan, a total of ten. The receipts of fish for the week have been about 275,000 pounds codfish, 100,000 pounds halibut, and 200,000 frozen herring.—*Cape Ann Advertiser, Feb. 23d.*

ICE YACHTING.—Last week was a very lively one for the ice yachtsmen of the Hudson, the ice on the river at New Hamburgh having been in excellent condition up to Friday afternoon. On Monday, the 19th, the non-active members' race of the New Hamburg Ice Yacht Club, for second class yachts (those carrying less than 350 square feet of canvas) took place, Commodore Grinnell's Centennial yacht Whiff winning. On Tuesday, the 20th, in the forenoon, the non-active members' race for third class yachts came off, over a ten-mile course, and was won by the Magic in 26m. 15s.

Later in the day the non-active members' race for first class boats (those carrying more than 350 square feet of canvas) was had over a twelve-mile course, the Zero winning in 25m. 20s.

On Wednesday, the 21st, the race for the "Kidd" challenge pennant was called by Commodore Grinnell. Seven first class boats drew up in line, the largest, the Flying Cloud, carrying 620 square feet of canvas and being 53 feet in length from tip of bowsprit to end of boom. The other yachts were the Bertie, Phantom, Quickstep, Zero, Zigzag, and Zephyr. After a magnificent race the latter won, making the twelve miles course and crossing the line in the splendid time of 19 minutes from the start.

On the 22d the yachts of the second and third classes, in their turn, sailed for the pennant, the Whiff winning in 47 minutes. All the regular races of this club have been sailed, as well as two fine scrub races. In this the club has been more fortunate than the rival club at Poughkeepsie, which so far has only sailed one race this winter.

ST. AUGUSTINE YACHT CLUB.—This Club has now been incorporated by act of the Florida Legislature, under whose provisions it has become owner of the building now occupied by others. We learn that its finances are in a flourishing condition. Their first grand regatta of the season is appointed for March 3d, with a fancy dress and masquerade ball to follow.

—A life saving station is to be established at St. Augustine, and the Yacht Club there has contributed liberally toward the outfit. This Club is composed chiefly of northern gentlemen, who spend the winters in Florida.

—Astor's yacht, the "Atlanta," of the New York Yacht Club, which has been in Florida waters for the past two months, was at the St. John's bar on February 20th, waiting for an opportunity to sail for New York, the weather preventing her from getting to sea.

—Two steamboats are being built at Greenpoint for California waters. It will cost $9,000 to send them packed in sections, to San Francisco.

The *New York Illustrated Times* has assumed the leadership in the matter of reporting the theatrical and dramatic news of the day. It is the only American paper which gives pictorial representations of plays while on the boards of the Metropolitan stage. It gives as well faithful artistic portraits of the leading actors, with carefully-written biographical sketches.

The *Illustrated Times* is published every Saturday morning. Price 10 cents.—Adv.

L'Amerique, the name of the French steamer, recently wrecked, is pronounced *"lam-a-reek."* Long before the unfortunate vessel foundered upon the shoals, however, the name had been bestowed upon a new cigarette, and therefore the name and the cigarette were in everybody's mouth. The secret of the success of L'Amerique is that it is a novelty manufactured from the purest Louisiana Perique and that wonderfully popular tobacco—Vanity Fair.—Adv.

That which is good for the delicate skin of the baby is no less delightful for the use of mature people. It is, therefore, that B. T. Babbitt's Toilet Soap, a new article just put on the market, merits a word of praise. Made of the purest vegetable oils, and without artificial scent, it is simply the perfection of soaps for toilet use, whether for old or young.—Adv.

Answers to Correspondents.

G. N., Baltimore.—Perch fishing begins in April.

JOHN.—The fare to Nassau, N. P., from New York, via Savannah and St. Augustine, is $45 gold. Excursion tickets $88. Inquire of Murray, Ferris, & Co., 52 South street.

BIRCHAM, Halifax, N. S.—Can you tell me the usual gait in running of the Virginia deer? Is it a trotter or jumper? Ans. This deer runs like a horse whenever in haste. He rarely trots. Will print next week an important paper on the subject from a gentleman well versed in the habits of the Cervidæ.

G. F., Yonkers, N. Y.—Ten men enter in a sweepstake at 10 birds each, the money is divided in three prizes, four men tie for the first money; have they any claim to the second or third money? Ans. Unless "class shooting" was specified, they shoot off for all the prizes.

F. L. D., Gibsonton Mills, Pa.—Please inform me best time for duck shooting on Kamkakee swamp and name of a party who would answer a letter or telegram and lodge a party of three. About what is cost per day, including boat and guide? Ans. The best shooting is in the fall. Have requested a party to write you particulars.

PROGRESS, Philadelphia.—Did not the party who sent you the report of the Fisherville, Ontario, ride match mean the Frank Wesson rifle instead of the Smith & Wesson? Ans. He undoubtedly did; and we should have corrected it. Thanks for your offer.

F. S., New York.—Where can I have a month of good summer shooting and if possible a little fishing? I shall leave New York the 25th of July or sooner. A country farm house a day or so from here would be preferable, with board not to exceed $8 per week? Ans. We can recommend no better place than Barnegat Bay, on the Jersey coast. Go down first and take a look.

J. M., New York.—Will you kindly give me some information in regard to large game hunting in Michigan? Ans. If you will give us full address we will send you the large and very complete pamphlet issued by the Grand Rapids & Indiana Railroad. Tells you all about the best localities for game and fish.

T. M. F., Rockville.—Can you inform me where I can get the best map of Florida for finding the small rivers, lakes, and towns, that are not on our common maps? Ans. Address Florida Land & Immigration Society, 21 Park Row. Ask for Apthorp's new map. Let us remind you that your question has no claim on our attention, as you write anonymously.

J. A. D. Boston.—Can you inform me how to teach a Newfoundland dog so as to make a good watch dog of him; he is now five months old? Ans. The qualities of a watch dog come by instinct. If after your dog is one year old you keep him chained in the day time and let him loose at night, he will probably make a watch dog.

D. T. C., Boston.—Will New York make a closed time for smelts this season, and put them out of market during the spring? Ans. Write regarding this matter to Hon. R. B. Roosevelt, this city. The fact is no smelts of any consequence are taken in New York waters, our supply comes almost entirely from Maine and Nova Scotia; very few from Massachusetts now.

H. A., Montpelier, Vt.—Some weeks since, you published an article relative to boats, in which a Newport built boat was especially spoken of, I believe, as safe, a good sailer, &c. Have mislaid my copy, and should like another; also to know the names of a builder or builders of these boats? Ans. If you will write to Messrs. Herreshoff Bro.'s, Bristol, R. I. You will get all the information about the boats. We cannot place the article from your discription.

M. H. B., Greenville, Pa.—1. Is 204 pellets in a 30-inch target, 30 yds., 4¼ drs. powder, No. 8 shot, 1¼ oz. shot, a fair target? 2. Is 119 pellets No. 8 shot, 1¾ oz. 35 yds., 16 inch target, a fair average? 3. Is 93 pellets No. 8 1¼ oz. shot, 4½ drs. powder, 45 yds., an average? Ans. 1. In an ounce and a quarter of No. 8 shot there are 493 pellets. 2. Target No. 2 is good, being at a 16-inch target. 3. No. 1 is fair average for a cylinder bored gun, and No. 3 is good if at the same target as No. 2.

LOONS, Boston.—You would oblige me much by answering the below queries: 1. What place around Moosehead would I find the most number of partridges? 2. Is it possible to shoot a "loon" while on the surface, because I have been told that they can dodge the flash of a rifle. Ans. 1. Take boat from Kineo House to the head of the lake, and ascend Wilson's creek, or most any of the streams that empty into the lake. 2. Loons are often shot with a rifle while on the surface, but they frequently dive when hit and are not found until some time after wards.

S., Philadelphia.—1. How Many pellets should a 12-bore gun loaded with an ounce and an eighth of number eight shot thrown into a 30-inch circle at 30 yards; gun choked-bored? 2. How would be the best way to load a 12-bore choke gun weighing 8¼ pounds to shoot ducks, the gun is a breech-loader? 3. How can I tell how much my gun is choked? I can see it quite plainly and feel it? Ans. 250 at least. 2. 4½ drs. powder, 1¼ oz. No. 4 shot. 3. You can only tell by targeting it.

W., Philadelphia.—The chamber of my breech-loader is —— long. Ely's paper shells reach the nearest mark to the end of the chamber and the Sturdevant brass shell to the other mark; are the shells long enough, and if not can I get longer? Ans. The mark you give we measure to be 2¾ inches, which is the regular length of the Ely 12-bore shell. If your gun is a 12-bore these shells should fit; if it is a 10-bore, or if the chamber is 2¾ inches, you can get shells to fit, or Ely's blue shells as long as three inches.

J. M., Lockport.—The Winchester rifle has a movable iron lever or gauge, under the breech, does a person, in firing, have to work the lever forward and backwards, in order to fire the next time? And if the aim interrupted in preparing for next shot? or is the cocking regulated by pulling the trigger, and the gun held "on aim" until all the charges are expended? Ans. The lever must be worked to extract the old shell and throw a fresh one in the chamber. In doing this the aim would of course be distroyed and a fresh sight taken.

INQUIRER, Boston.—I have a valuable setter pup about nine months old that I recently sold in apparently good health and condition; three days afterwards the dog was returned to me totally blind, he being in other respects all right, having a good appetite, &c. Can you tell me what is the cause of it? and if so what to do for it? The dog was sent and returned by express. Ans. Without seeing the dog or knowing what was done to him on the journey we can give no opinion as to the cause of trouble. What is the present condition or appearance of the eye?

SIMONDS, Boston.—1. Will it be worth the difference in the price, between laminated and Damascus steel barrels, for the Fox patent gun, weighing ten pounds? 2. What kind of shells, of whose manufacture, and what cost, shall I use? 3. What is a proper charge of powder and of shot for such a gun? Ans. 1. It is a matter of taste; the laminated barrels will last as long as the others. There are a nunmber of makers of brass shells. Those of the U. M. C. Co. will cost you $1 15 for 12's and $1 40 for 10's. Ely's, $1 25 for 12's and $1 50 for 10's. 3. It depends entirely upon the kind of shooting.

SUBSCRIBER, Port Hope.—1. I have heard it argued a good deal lately about what size shot should be used at pigeon matches, 21 yards rise. I have heard it said as coarse as No. 5 shot used. Please enlighten me on the subject, what size you think proper? 2. Can you inform me how eels breed? Ans. No. 8 is the size of shot generally used in pigeon matches, although we have known some men to use as small as No. 10 at 21 yards rise. 2. The mode of propagation of eels has never been accurately decided; for articles on breeding them see pages 66 and 67 of our last volume.

W. A. A., Jr., Newark, N. J.—I have a small black and tan dog, he is six years old and he has a very bad cough, he weezes so when he coughs, it appears something like the asthma; when he coughs he loses all control of himself and falls over and seems to lose his breath. His appetite is good and his bowels are regular; it has been coming on him for a long time? Ans. Give your dog the following: Barbadoes tar, two drachms; powdered squills four drachms; extract of belladonna, three scruples; liquorice powder a sufficiency. Beat into a mass and make into twenty pills, giving four daily. Feed the dog on rice and milk instead of meat and see that he is exercised.

T. G. M., Cumberland, Md.—Is the summer climate of Florida an unpleasant or unhealthy one for northern men? Can such a person live there during the summer without serious discomfort from heat; and what portion of the State offers the most desirable climatic inducements in this respect? Does it possess any advantages in this matter over the other Gulf States? Ans. The peninsular location of Florida does undoubtedly give it an advantage over other Gulf States, and it is a singular fact that the summer mid-day heat is more tolerable than at the north, while the nights are much cooler. These conditions apply to almost all parts of the State south of lat. 29°.

S. H. W., Philadelphia.—1. Is it any harm to have a bitch covered at her first heat, one year old? 2. Is one connection of ½ of an hour sufficient to produce pups on the 9th day of showing heat? The dog would not cover her afterwards; it was the first time for the dog; he is five years old, healthy and active; should the bitch be well fed and have plenty of exercise? Ans. 1. It is not advisable to allow a bitch to be served the first time of heat. 2. Under ordinary circumstances the service should have been sufficient, but considering the age of the bitch you are not likely to have a litter of strong and well developed puppies. By all means feed her well and give plenty of exercise.

SUBSCRIBER, York, Pa.—Judging by the the symptoms I have given you at length above, please answer the following questions regarding my dog: 1, What was her disease? 2. Did she have the proper treatment? 3. If not, what should have been the treatment? Ans. We think the dog died of inflamation of the bowels, but you say nothing about the number or quality of passages during the two last days. You should have given 25 drops of laudam in two ounces of starch water, as an enema after each passage and so controled the diarrhœa. You might also have given three or four grains of quinine three times a day in pills, and poured beef tea and milk down the throat if the dog refused nourishment. We don't think it distemper.

J. W. BELL, Boston.—1. What is marine glue, or varnish, such as is used on paper boats? 2. Does it require a special kind of paper for boats? Ans. 1. Shelac varnish is used to make paper boats impervious to water. The varnish may be prepared after the following formula: 16 pounds orange shellac, 4½ gallons alcohol. Let the shellac dissolve in the alcohol and apply with a brush. 2. Messrs. Waters' of Troy, N. Y., the only manufacturers of paper boats in this country, use paper made especially for their business? Manilla paper is used for racing shells, and linen paper, one-sixth to one-eighth inch in thickness for canoes, gigs, &c. E. Waters & Son's claim that their patents cover the right to make boats of paper, and that no person can build a boat of paper in the countries where their rights are registered, without infringing upon them. For farther particulars address E. Waters & Son's, Troy, N. Y.

OLD SUBSCRIBER, Baltimore.—I am going down in a short time to visit Capt. Ayres at Ocean City, whom you recommended, and would ask you to answer the the following questions for me: Is there good duck shooting down there as well as geese, and what varieties of ducks? Is the shooting done over decoys as on the Chesapeake, and how many are necessary? My gun is a 10 bore Greener, weighing 8¼ pounds. Is that heavy enough? Are there any men having live geese decoys whom I can employ, and what do they charge? Is there any snipe shooting? Will I have to go far from the house to get duck shooting, or are there good points near at hand? Ans. If you go to Ocean City, you will have to stop first at Berlin, at Wegner's Hotel. As the cars run only in summer, except on special occasions, you will have to pay $3 for a wagon to take you to Ayres. His house is right on the beach, and the fowl fly over it. Use blinds, with or without decoys. Live geese decoys handy. Ten-bore gun too light. An 8-bore is better. Board, including all not over $2 50 per day. They'll post you at Berlin. Take cars from Wilmington to Salisbury, and change for Berlin.

THE BEST SPORTING PAPER PUBLISHED.—The fullest sporting news published in the United States appears in the *New York Illustrated Times*. The department is edited by the well-known "Crickmore," whose intimate acquaintance with the turf and sporting matters generally is not equalled by any writer in the country. Every incident of any importance in racing, boating, ball-playing, &c., &c., is promptly and exhaustively recorded from the personal observation of the writer, accompanied by illustrations whenever the circumstances justify. The *Illustrated Times* is published on Saturday and for sale at all news stands —Adv.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line: outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 1, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

BY OCEAN STEAMER TO ST. AUGUSTINE, FLORIDA.—Since the day when the Spanish fleet sailed into the harbor of St. Augustine, three centuries ago, scarcely has the ancient town been so excited as on the 10th or February, just passed, when the steamship Leo of the Savannah and Nassau line, passed over the bar and under the walls of Fort San Marco, and for the first time established steam communication between it, the eldest city on the continent, and the outside world. The good ship was not only received enthusiastically by the assembled crowds on shore, but formally welcomed by the Mayor, while her officers received the hospitalities of the hotels and the town. The local paper, the *Press*, thus congratulates everybody upon the astounding event:—

"It has been practically demonstrated by the entering and departure at this port of the steamship Leo, that the bar of St. Augustine is of sufficient depth to admit large-sized steamers and sailing vessels into the harbor. We look upon this experiment on the part of the owners of the Leo, in testing the practicability of these ships entering this port, as one of great significance, and destined to prove of immense benefit to the Ancient City. The Leo arrived off the bar at about eight o'clock on Saturday morning last, and owing to the absence of the pilot was compelled to wait for the next flood tide, when she came over the bar, drawing twelve feet of water, and there being over eighteen feet on the bar, and in thirty minutes from the time she crossed the bar she was safely alongside the dock.

We are much gratified with this inauguration, as we foresee of a line, not only between here, Savannah, and Nassau, but ultimately between St. Augustine and New York. It is already contemplated by the owners of the Leo to connect with their line at Nassau a line to Havana. This, with the contemplated railroad to Jacksonville, will make St. Augustine the point for embarkation of freight and passengers, by rail, direct to New York from Havana; then with a line of steamers direct from St. Augustine to New York will necessarily take the sea route for passengers from Jacksonville, and all along the St. Johns river. This experiment of the Leo has proved the superiority of our bar to that of Jacksonville, and as a port of entry equal to Charleston or Savannah, for vessels drawing twelve to fifteen feet of water.

The people of St. Augustine have every reason to congratulate themselves on the continued prosperity of their city. The finger of prophecy points unmistakably to the good time coming, when the Ancient City will attain that prominence among her Southern sister cities which shall be equal to any of them on the Atlantic coast. The rapid growth of St. Augustine during the last five years is unprecedented by any town north or south, and in another five years we will see not only a line of steamships between Nassau, Havana and New York, but a canal navigation between St. Augustine and the Indian river, opening thousands of acres of land for emigration, and making St. Augustine the market for an immense back country."

By the Leo the fare from Savannah to St. Augustine is reduced to $10, making this trip from New York to the "Ancient City" much cheaper than ever. Murray, Ferris & Co., 62 South street, are agents for the line in this city.

"COMANCHE GEORGE."—We received a visit last week from George Anderson, the Government Scout, who is well known in Texas, Arizona, New Mexico, and to the Southwestern Indians generally. George was on his way to Washington for orders. He says that when the Sioux are moved down south into the vicinity of the Comanche, Kiowa, and Apache reservations, there will be music, and he wants to prepare to join in the dance. He is a fine looking man of forty, quite intelligent and affable, speaking a half dozen Indian dialects, fond of botany, geology, etc. He brought on the seeds of some rare New Mexican plants, which he has distributed among the newspaper men, and we were fortunate enough to be included. Altogether George is a very quiet fellow—when he is asleep. He says he has only once been guilty of taking a scalp with the ears on.

THE BLUE GLASS EXCITEMENT.

THE discussion of Gen. Pleasanton's alleged discovery of certain properties in blue glass, occupies considerable space in the current journals. He asserts that the developing and curative powers of sunlight transmitted through violet glass enormously exceed those of unmodified light, and citing from his many experiments gives a number of extraordinary instances in confirmation of his belief. From these we may select the following as examples of its effects on plant and animal life:—Cuttings of vines of the thickness of a pipe stem, and but a few inches high, planted in a grapery of which the glass was one-eighth blue, increased in five months to a length of forty-five feet, and to a diameter of one inch at the base, while others similar in all respects to these, exposed to simple sunlight, in the same time had grown but five feet. In eighteen months from this planting those under blue glass yielded 1,200 pounds of grapes. A deaf and rheumatic mule was completely cured by allowing the blue light to play each day upon the affected parts; an Alderney heifer exposed to the influence of the filtered light was regarded as mature for breeding purposes at the age of four months, and produced a calf when thirteen months old.

There can of course be no doubt that the results instanced by Gen. Pleasanton are authentic, and the only question, therefore, is as to the cause or causes which produced them. The discoverer of the supposed properties of the colored glass of course believes them to be due to the glass, but no scientific explanation of these effects has yet been given. On the other hand investigators of eminence, by means of experiments made with the utmost accuracy, have arrived at conclusions quite opposed to this view. Gen. Pleasanton is by no means the first person who has investigated the properties of the different rays of the spectrum, and the observations of Sachs, Baudrimont, Cailletet, Vogel, Pfeiffer, and many other physicists, have failed to show any such effects as those related above. Thus Cailletet, in 1868, asserted that "violet light was in some respects hurtful to plants," and Baudrimont "that violet light was positively injurious to plants; they absolutely require white light."

It is, nevertheless, but fair to say that experiments somewhat similar in character to those above referred to have been tried in Europe, and, it is said, with the best effects; for we are told that Dr. Ponsa, Director of the Turin Lunatic Asylum, confines his very violent patients in blue rooms, and that the results are in the highest degree satisfactory.

For a very intelligent, though somewhat technical article on this subject, we may refer our readers to a recent number of the *Scientific American*. The blue glass may be able to do all that is claimed for it; may be the panacea that is to free all living things from their fleshly ills. We hope that it is, but until some more satisfactory explanation of its supposed power is given, we ask leave to doubt.

ICE NAVIGATION.

IN our issue of Nov. 16th, 1876, we noticed an ice velocipede, not differing greatly from the land velocipede, except that the drive wheel, instead of being smooth-shod, as in the road machine, is armed with iron points, and is arranged on a shaft that is journaled on two longitudinal springs, and fitted into a frame that rests on runners. The wheel can be lifted from the ground at any time, and the runners are enabled to pass over small obstructions on the ice. This principle has been carried out and applied the present winter, with gratifying success to the propulsion of a large passenger and freight steamboat on the St. Croix river, Wisconsin. This boat was constructed by M. Mover, of Arcola, Minnesota. She has an iron wheel fitted with spurs, and is propelled by steam on steel runners.

We can conceive that such a craft is perfectly practicable on ice of only tolerable smoothness. On glare ice its speed would be greatly accellerated by the addition of canvas sails of approved pattern. And we can readily estimate the inestimable service that might accrue from their employment upon the great lakes, especially upon those that are closed by solid ice for five months of the year, and whose coast dwellers are isolated and practically cut off for that period from communication with the rest of the world. Those persons who have sojourned on the Great Lakes have seldom recognized an event so inspiring as the advent of the first steamboat of spring, and the opening of navigation.

We are quite earnest in urging the employment of ice steamers for lake and river navigation in the northern regions; and while we are well aware that the ice is not always smooth, and that it may be impassible for the greater part of the winter season, still the few trips that could be made would prove of inestimable commercial value.

To the inhabitants of Prince Edwards Island, in the Gulf of St. Lawrence, what advantages would accrue if communication could be kept open throughout the year across the narrow strait that separates that island from Nova Scotia! It is only nine miles wide, but the ice has hitherto proved a barrier almost insurmountable. Many are the contrivances that have been instituted to overcome the difficulty so that regularity in the transmission of passengers and mails could be assured; but none have succeeded. The open boat that can be pushed over the floating floes, and rowed across the open water and through the narrow passages, as opportunity has offered, has proved the best of all, thus far, but the crew and the few passengers that attempted the perilous journey have often suffered severely from hardships and inclement weather. Last summer a powerful cabin steamer of peculiar model and construction of hull called the "Northern Light," was built at Quebec by Capt. E. A. Jewell, a prominent ship builder, and put on the route when water navigation closed. She was not expected to jump icebergs and steam over solid fields, but was built massively strong, with powerful engines to separate floating floes and hammer at consolidated masses, her hull being of such shape as to be lifted out when "nipped." In the early part of the season, her trips were very successful, but as the weather grew colder and the ice thickened and accumulated, moving and grinding through this strait with a five-knot current, her experience became thoroughly Arctic. A month ago she was in such peril that the crew made preparations for abandoning her. On the following week she got into still greater straits, becoming immovably jammed in huge masses of floating ice about ten miles from Pictou Island, and between it and Cape George, with no open water near to which she might force her way. The ice surrounding her was of the hummock type, rendered familiar by descriptions of Arctic navigation. The bergs stood higher than the vessels masts. She got out, however, by some fortuitous chance, escaping serious injury. Of course no steamboat like that running on the St. Croix river, to which we have referred, would answer for the Strait of Northumberland. We have only referred to the latter incidentally, as coming within the scope of this subject of ice navigation.

THOUGHTS ON EDUCATION.

NO. II.

IT is very generally understood that education means a "drawing-out" or development, but the mistake is not so generally perceived of confounding it with the acquisition of knowledge, and yet the phenomenon is common enough of a well-informed but ill-educated man or woman. The memory may be made a perfect storehouse, and its happy possessor be a prodigy, in the shape of a walking cyclopedia, but if the intellectual digestion be from any cause deranged, the result is the anamoly referred to above—the possession of a wide range of knowledge with a total lack of education. The poet well understood the distinction when he sang:—

"Knowledge comes, but wisdom lingers,"

knowledge, the possession of facts; wisdom, the ability to make them practically available. Taking the usual tripartite division of the human faculties into the physical, the moral, and the intellectual, and conceding the nicety of their natural balance, it follows that one cannot be neglected without detriment to the others; or, to put the proposition in another form, any system of education which is directed more to the cultivation of one than of another is correspondingly defective. Much as many people seem disposed to regard it as such, the *mens sana in corpore sano* is no fiction in opinion, or alcohol may very frequently be found the cause of the ravings or inconsequent wanderings of a "mind diseased," but it should not be forgotten that it is a mind confined in a body diseased through these agencies. This is an extreme case, quoted for the mere sake of showing that body and mind act and re-act upon each other, and can no more be considered separately or independently, in a question of education, than in one of insanity. So, not very long ago, medico-jurists were in the habit of treating madness as a mental affection. Now it is known to be nothing more or less than disease of the brain, to be estimated in point of degree, and treated by the practical professor of medicine.

But between insanity and sanity are many grades and stages.

There is first the eccentricity occasionally attaching to genius, but more frequently to be ascribed to the want of it; the dullness of the intellectual sluggard which prevents its victim from enjoying the possession of ideas of his own or appreciating those of others. There is that mental obliquity or perverseness, which will, in spite of all teachings, persist in looking at any given subject from the wrong point of view; or, the simple stupidity which can or will take coguizance of nothing, or the superficialty whose mental world is a wide extended plane resting upon

and scarcely covering chaos; or the levity which finds life a huge joke, and the grave the doorway to a Paradise of fools. Such, we say gravely, is human nature. It is just possible, however, that these woeful results are the distortions of nature—the direct products of an erroneous system of education. Men speak learnedly of idiosyncracies, and contemplate with resignation mental peculiarities, which they, in their wisdom, hold to be the shapings of the divine mould. But let us turn to the physical for an illustration. On the street, every day, men and women may be seen of whom only a strong effort of the imagination could bring us to think that it was to such as they that the Greek artist pointed, when he said to his pupils, as he looked on the passers-by, "There are your masters." Narrow chests and stooping shoulders are physical facts for which our senses most readily suggest causes, such as want of exercise, confinement, or one or other of the thousand and one things which simply mean, at last, a total ignorance or absence of the primary elements of physical education. There is no perceptible difference between such cases and those of mental deformity. Experience tells that the greater number of instances of intellectual excellence or deficiency can be traced to some specialty in the individual's early education. We speak, it is to be observed, generally. Bacon must have entertained the same idea, when, in one of his Essays, he recommended certain studies for the remedy of certain mental weakness, or the development of certain faculties. But beyond this there is the ever-present difficulty of telling what physical or moral agency is affecting the mind; what mental or moral influence is affecting the body and brain, or what physical or mental agency is affecting the moral system. Hence we come to have an idea of the urgent, almost vital necessity of having education complete in all its parts, and of the enormous and weighty trust confided to the educators of the young.

GAME PROTECTION.

Quail in Confinement.—One of our city correspondents writes us that he also is losing the quails he had intended to keep through the winter. As his experience may be of benefit to others among our readers, we print it. He says:—

"Three years ago I had fifty-seven, lost twenty-one; last year I had forty-eight and lost them all. This year I had one hundred and thirty two, and found that they were dying at the rate of five and six a day. On the 10th of February I put out fifty-eight—all that I had left. They were in good condition; in fact, the birds would seemingly feel well; next day some would be dead. Some of the birds seemed to have the pip, others would be puffed up like a balloon even down to the thighs; some were emaciated, and a few had their heads injured. The room the birds were in was large, sunny, quiet, and well ventilated with a canvas ceiling. Feed, buckwheat, bird seed, and a very little cracked corn. In former years, when I had only eight to twelve birds, I had no trouble and none died. My idea is, that too many quail in one coop, as with barnyard fowls, breeds disease. I think a discussion in your valuable paper as to the cause, treatment and cure, if any, would be of interest to many of your readers. I am discouraged with my experience in quail propagating, and if no satisfactory cause and cure is given, I have had enough of it." E. S.

Glenville, Conn., February 19th, 1877.

Editor Forest and Stream:—

Sir, for upward of two years I have been a constant reader of your excellent paper, and have noticed many articles, in both Forest and Stream and *Rod and Gun*, hitting the poor "pot hunter," and knocking him right and left. I have seen the question put, "What is a pot hunter?" and Forest and Stream said, "a pot hunter is a "market hunter." Others have answered and said, a person who shoots more game than he can possibly have use for at his own table; and B. H. P., in an article dated Vicksburg, January 13th, 1877, says, in your issue of the 8th inst., "You have doubtless heard of pot hunters, who sneak about in the bush until they find a covey of birds huddled together for protection from bad weather, and then blaze away at them with an infernal old "Spill-out," and murder the poor things by wholesale." Now, if they are such poor shots, I don't see how they can kill a whole covey of birds; they may get some three or four, and the rest will get away; but, if it had been a "gentleman sportsman," with a two or three hundred dollar dog, and a three or four hundred dollar gun, he would have had the last bird in that covey before he had "let up." I would like Mr. B. H. P. to define what he means by "Infernal Spill-out?" The only gun I ever heard of that I would take the liberty to call "an infernal old Spill-out," is a sixteen pounds gun, shooting six ounces of No. 3 shot, driven by sixteen drachms of powder, used by one of your correspondents, who calls himself "Rusticus," who could kill and disable from "forty to sixty" brant at one discharge. He shoots from a sink-box, after the water and sand bar within a few yards of his hidden position has become densely packed with brant. When, at the same time he says, "and presently a company, circling nearer and nearer, swept over our box," then would have been the time (if I am rightly informed) when a gentleman sportsman would have delivered his fire, and would have felt satisfied to have bagged from four to six birds. But, it would have taken the last brant in that immense flock (he claims there was 5,000) to have satisfied Mr. Rusticus, for, after having killed and disabled from forty to sixty birds at one discharge, he laments that he has not two or three more of those "*infernal old Spill-outs*" to slaughter the rest of the flock with; he also claimed that he and his companion killed in five consecutive shots, "one hundred and twenty-one" brant. Now, if there is a pot hunter in this country who can beat this bag of game, he ought to be hung up by the thumbs until he promises to be a pot hunter no more. And this same correspondent says, in part second of his article, entitled "A Tale of Two Flats," that a market gunner (who must be a pot hunter) told him, after witnessing said correspondent kill thirty geese and fifty ducks in one day, that he, the market gunner, alias P. H., never knew such a shot to be made in that neighborhood before.

Now, Mr. Editor, when a southern market gunner admits that gentlemen sportsmen from the north can come there and slaughter more game in one day than was ever known to be killed in that neighborhood before (in the same length of time), I think it time that the cry which has gone up from one end of the country to the other, that our game is being exterminated by pot hunters, ought to be made to read "by gentlemen sportsmen," for, where ninety-nine out of one hundred so-called pot hunters can afford to spare a day, or a half a day, and go out without any dog, and with what B. H. P. calls an infernal old spill-out, and Mr. Rusticus calls a pop gun, and get a small bag of game, the gentleman sportsman will go out day after day with his costly gun and more costly dog, and does not return satisfied until he has exterminated every covey of birds there is within a radius of ten miles. Rather rough on the gentleman sportsman! but I think they are having everything too much their own way.

Mr. Editor, hoping this will be given a place in your valuable paper, I will come to a close, hoping some of your correspondents will "let up" a little on us poor and much abused pot hunters. I remain, very truly yours,

W. H. Barton.

—The Nonotuck Game Club has just been established at Northampton, Mass., with the following officers:—

"A. P. Peck, President; E. O. Damon and Gen. Otis, Vice Presidents; G. W. Critterden, Secretary, and L. Warner, Treasurer. The club will at once proceed to take active measures to stock the ponds in the vicinity. Quail will be procured, and an effort made to propagate them, and the experiment of planting wild rice to bring ducks back to their old haunts.

New York.—We have come to look regularly in our Rochester exchanges for some item regarding illegal fishing in Irondequoit Bay, and are rarely disappointed. The last issue of the *Express* contains a paragraph to the effect that six men and two women have just been arrested, some of them old offenders. It seems that they catch as much as 150 pounds of fish per day, sometimes, which is readily sold. If the purchasers were implicated in the offense, and made to feel the penalty, and if the buyer of fish or game out of season was placed on the same footing as the receiver is to the thief, it might put a stop to poaching.

Slaughtering Deer.—An Albany correspondent sends us the following letter from a well-known Northwoods guide, for whose veracity he vouches. It is time that vigorous measures were taken to stop the wholesale slaughtering of deer out of season. In this instance there could have been no difficulty whatever in obtaining evidence, and the matter should he brought to the notice of the Legislature:—

Long Lake, February 9th, 1877.

The snow is very deep in the Adirondacks, and thinking that perhaps you would be glad to hear how we are getting along, thought I would drop you a line and let you know. There is nothing to do only to take notice of those that claim to be guides. Some of the first-class guides are having a very nice time killing deer on three feet of snow, among whom are Mitchell Sabbaties, Charles Sabbaties, J. D. Blumby, Alba Cole, Justin Larros and several others. Now, if you sportsmen wish to have the deer all killed off on snow shoes and out of season, I have nothing to say. If not, please publish them in the sporting papers. It is my request that you should do so. The Sabbaties' and J. D. Blumly killed twelve in two weeks, and for proof please address L. Hall, Long Lake, Hamilton, Virginia.

L. M. H.

Franklin County.—Our correspondent, Mr. A. R. Fuller, writes from Meacham Lake as follows:—

"I send you a copy of a resolution passed by the Board of Supervisors of this county at their last meeting. Some of its features are good, but if enforced it would be clearly for the benefit of one class of people—those who hunt with dogs. It entirely ignores the still hunters. The protection of the game of our State should be attended to, but it is a very delicate thing to touch, and unless all classes can be made to feel that they have a part and interest in it, it will be very difficult to enforce any law. I will write you soon the result of my labors here with the salmon and brook trout."

The resolution is invalid and unconstitutional, as supervisors have no power to make laws which are in conflict with the general State law.—Ed.

New Jersey.—A valued correspondent sends us from Monmouth county, a letter which is too long for publication, but from which we make the following extracts:—

"I've not heard a gun fired since the close of the season. I wish I could say as much before its opening. Through our county, and particularly along the shores of Barnegat Bay, the greatest amount of unlawful trapping and snaring prevailed during the past season. It is surely driving the patronage of the sportsmen from these shores, and if the resident land owners would awake to their true interests they would stop it of their own accord. I think the trapping season commences very early down there. I was there with a party of friends Nov. 10th, and as we could not have any good duck shooting we tried the main land for quail, with the same result. We saw any quantity of quail traps, and found the birds very scarce thus early in the season. This is one of the most desirable and convenient localities for New York sportsmen and others near by, and it will be necessary for us all to make some efforts to stop and correct this abominable practice."

Now that pound net fishing has been abolished in Barnegat Bay, and the results have already been felt, it should be encouragement to the local sportsmen to see that their land was as well protected as the water.—Ed.

The Florida Legislature is likely to pass a State game law the present season. Several prominent residents of the State are pushing the matter, and we have assisted all we could in furnishing copies of State laws, suggestions, and such other data as we had at command,

Pennsylvania.—The Greenville Sportsmen's Club met in the rooms of the President, S. S. Hewitt, on Friday evening, the 9th inst., and elected the following officers for the ensuing year:—

President, Wm. P. Leech; Vice-President, Dr. F. Herrick; Treasurer, C. R. Beatty; Secretary, M. Hargen Brooks. It was determined to purchase a $50 badge as a shooting prize, and an assessment was made accordingly. After the adoption of the following resolution, offered by the Secretary, Club adjourned to meet on the second Thursday in March next:

Resolved, That it is the desire of this Society not in any way to conflict with the interests of the farming community, but, on the contrary, to cultivate friendly relations with them, and hope that they may so reciprocate as to render those relations mutually beneficial.

Ohio.—Regarding procuring live quail from Ohio for restocking, a Tiffin correspondent writes us as follows:—

"I see in your issue of the 8th inst. that the Yonkers Sportsmen's Club have procured their first instalment of 144 live quail from Ohio. We have a law in this State which forbids the killing of quail until after Nov. 15th, and the trapping at any time. But perhaps somebody was kind enough to drive them over to their barn, for I don't suppose they would encourage any one to violate our game laws by offering to purchase quails that had been trapped. Buck Shot.

Indiana.—The game laws of Indiana are undergoing revision in a manner which does not suit the views of many sportsmen of the State. The following letter, dated Connersville, Indiana, February 15th, 1877, is from one of them: "Our present game laws are good enough if properly enforced, but our Granger solons are now racking their brains trying to devise a new one, that will put the sportsman on just as small an allowance of sport as possible. The first bill presented prohibited the killing of quail for five years, but it was defeated by a vote of forty-six to thirty-four. Mr. Trusler, of this county, then presented a bill (copy enclosed), which will in all probability become a law. It leaves us two months for quail—November and December. The month of October we can afford to loose, as during this month a great many birds are found no more than half grown, but we do not like to loose our January shooting. If our trespass and game laws keep on contracting, in five years the sportsmen in this State will have no rights that anybody is bound to respect. Weather very fine for the past three weeks—a few snipe coming in. Think we will have good shooting in a few days.

Duck No. Two.

[If our Indiana friends are confined to two months for quail shooting, they will still be as well off as their brethern of the East. It does seem hard that January shooting should be prohibited, when the breeding season is yet so far off, and yet there is no wiser provision for the protection of quails in the whole statute book. During that and the succeeding month, the ground is likely to be covered with snow, and the birds are easily found huddled together in bunches, where they fall an easy prey to the pot hunter, who sometimes exterminates an entire bevy at one shot. Such has been the case on Long Island this winter, and the men who are doing it defy the game constables or authorities to prevent it.—Ed.]

—A writer in a western State says:—

"The winter has spent its force, the deep snows are melted, and knowing the deep anxiety of all "Gentlemen of the gun" as to the outlook for quail shooting for 1877, I thought I would give you the benefit of my personal observation.

In a country where farmers leave a large portion of the corn crop *unharvested* until spring, and where that which has been harvested is cribbed in the field—in cribs made of rails—and where the wheat and other small grains are threshed from the stack, quail will live through the coldest winters, amid the deepest snow. I have studied their habits this winter, and in localities where they were abundant in October. I found none in November, but in one neighborhood where the owner of the land rears a large number of hogs every year, feeding immense quantities of corn on the ground every day during the winter, I found no less than eight covies of birds in one field—enough to re-stock the whole country. Those that I killed (before the close season set in) were very fat. Their place of shelter during the night had evidently been used a long time from the signs. A more beautiful sight I never saw than the one that I witnessed the morning of January 29th, 1877. In the field before alluded to I had flushed and killed a few birds a few days previous, and learned that this was their feeding ground. So early in the morning I made my way there and secreted myself by a friendly wood pile, and very soon saw a fine covey of quail coming down a little ravine. How beautiful they looked! Perfect in plumage and fearing no danger they came gayly along. Soon another, and still another, came until within forty rods circuit, at least fifty of these beautiful birds were feeding and playing before my eyes. At length wearied with keeping still so long, I quietly walked out from the place of my concealment, flushing the two coveys nearest me. I did not shoot. It would have been an unpardonable thing to have killed a single bird. On yesterday the gentlemen who owns this farm was in my office; he reports the birds as unmolested. The "curse" of the whole matter is this: The boys and men shoot these birds on the ground, or rather on the snow, tracking them from place to place until they are killed or driven from their feeding places, where they perish with hunger. I advocate a law that will prohibit the shooting of quail when there is any snow on the ground; this, in addition to the present close season would, if enforced, soon restock our fields.

Hoosier.

—The editorial article in our last week's issue entitled "Jamrach;" was contributed by Edwin B. Hullish, of the Philadelphia Zoological Garden, who is known to many periodicals by the *nom de plume* of "Huon."

—T. A. Meyer, a baker, was attacked on the Hackensack plank road early the other day by two men. He struck one of the men with a long, hard loaf and knocked him off the wagon.

THE TROPICAL WANDERINGS OF FRED BEVERLY—Second Letter.

WRECKERS OF BERMUDA—HABITS OF FLYING FISH—THE ISLAND OF MARTINIQUE—SPIDERS LARGE AS SAUCERS—TROPICAL EXPERIENCES.

At last our vessel's injuries were repaired, the last nail and bolt driven, the last brushful of paint applied, and she slid from the railway into the sea. Having resumed her deck load of lumber, she was hauled out into the harbor, her sails spread loosely to the breeze, ready for the pilot. At 4 o'clock he came, the anchor was weighed, and we glided slowly past the wharves, past the shipping, past the picturesque white-walled town, past the frowning fortress at the narrow entrance to the harbor, between high rugged cliffs, out upon the blue ocean. The pilot left us, our course was shaped south southeast, and a gentle land breeze wafted us on our way. The sun went down behind the land, and we bade adieu to the island that had proved to us so great a hindrance, on which we had spent a month which we had confidently expected to pass nearly twenty degrees nearer the equator. Well, it had gone, and the memory enriched with many things new and interesting.

For two days we sailed on with a five-knot breeze, and gathered in our cabin had ample leisure to compare notes respecting the character of the people we had met. Prominent among our acquaintances stood the wreckers. They were the first to meet and greet us, and the last to leave us. Doubtless, also, they regretted our departure as much as any one—even more than ourselves. Regarding the character of the wreckers we had but one opinion, and that is fully shared in by the public with whom the names wrecker and pirate are almost synonymous. If the opinion of the captain and mate are entitled to consideration, the wreckers of Bermuda are little else than pirates pursuing their avocation under legal sanction. But perhaps the extent to which they bled our worthy captain may have been in a measure answerable for his feelings. As has been related the wreckers swarmed from the shore upon our vessel, and six of them remained until she was towed into port. No one of them rendered the least assistance, as our injuries were of such a character that our own crew were able to manage the vessel alone. For their claims for services the judge to whom they were submitted for arbitration awarded them *one hundred and fifty pounds* ($750). This was very manifestly an outrage, and undoubtedly there was, as other sea captains who had suffered avowed, collusion between judge and negroes. This was only one item of expense, and the bill total footed up, for real and imaginary repairs, over $3,000. It may be imagined that our captain did not leave port in a very happy frame of mind; and if I were to undertake to paint the character of a Bermuda wrecker *a la Captain* it would require a very thick deposition of pigment.

There are, of course, two views to be taken of the wreckers business. It is confined to the colored people, who reside in little cottages scattered all along Bermuda shore, especially along the western and northern, outside of which are the reefs. They are hardy, muscular, and perfectly at home in the water. They pursue their business as a means of livelihood, and to suppose that they brave the dangers of the sea from philanthropic motives is perfectly absurd. Their motives are purely mercenary. Can it be supposed that when looking off upon the reef, they discover a ship in distress, they think of the people in that ship? Certainly not. Their first thought, as they hurry to the shore and launch their boats through the roaring surf, is of the cargo in that ship's hold. They will save life, if it comes in their way to do so; but the saving of life is not the motive that urges them on. There are men, old residents of Bermuda, who have been the means of saving many lives. One I now call to mind, Capt. Masters, a resident of Port Royal, as gallant a white man as ever breathed, has saved above a score of lives, and often at the risk of his own. But his calling is not that of a professional wrecker. Having, then, the object in view of getting as much out of a wreck as they can, it is not strange that, if thwarted on the water, they should enjoin the assistance of their friends on land, higher in authority than they. This was the view entertained by the Doctor and myself. Indeed, my friend waxed warm on the subject and raked up his poetic fires, so to speak, and one evening, after lying on his back all the afternoon, presented us with what he called a condensed history of the whole affair. He said it was his first effusion; a statement worth its face value.

Full forty niggers were perched on our rail
Forty there were, and two,
They pumped no water and hoisted no sail,
Nor did they aid our crew.

And when our vessel was towed into port,
These niggers, forty-two,
Threatened to carry our captain to court,
Swore they would "put him through."

So they took him to town, and vowed that brown,
They'd "cook the captain's goose."
And that, unless he with the stumps came down,
He never should get loose.

And they brought him before a magistrate—
Rubicund, he, with wine—
Who peddled out law in a second-rate
Judgment shop, six by nine.

Then the Judge, said he, "it is clear to me,
These men you've tried to wrong,
And if all agree, I will pitch the key
To quite another song.

There are thirty-three men at four pounds, ten,
Seven and six for me.
I wish you a pleasant passage—amen!—
Over the stormy sea."

Then the Judge, he tipped the niggers a wink,
To the wreckers a wink wunk he,
And arm in arm they went out for a drink,
And the court adjourned—*sine d.*

When this rendering of the story was read to us the opinion of captain, mate and steward was unanimous that the Doctor had eclipsed even himself; that his name would be handed down to posterity as a marine poet of the first water. I suggested "horse marine," as perhaps most applicable, but the captain seriously objected, and said that poetry like that should be embalmed for future ages; and if the Doctor would make the round voyage with him he would give him his board free for a poem—a regular stunner—of the whole trip. I thought the Doctor seriously intended accepting this proposal, as he was unusually thoughtful that night and the next forenoon; but I found that his pensiveness was occasioned by premonitory qualms of sea-sickness, and not his poetical fervor.

Our first Sabbath out, after leaving Bermuda, was a beautiful day, with a good westerly breeze filling all our sails; mainsail, foresail, jib, flying and outer jibs, main and fore-topsails and staysail all drawing. The sky was blue, with smoke pearl clouds fleecy, and lying along the horizon. The mate, who would encourage us, gives us a history of his experience on a voyage "long with Capt. Lord in the North Star," coming from Europe, when we had just such weather as this from Madeira Isles to Bermuda; twenty-five days of slow, stiddy sailing, about five knot an hour, and we painted the ship from truck to water line." At night he prognosticated a pleasant voyage, for the stars were "thick as spatters and bright as blazes." But he was not so weather wise as we would have desired, for the very next morning the wind left us becalmed, rolling at the mercy of a heavy sea, and our deadly foe, old Neptune, exacted tribute as before. From the effects of that exaction we did not recover for many days, and every rough day we would have a return of nausea and sick headache, when we could neither read, write, walk, or eat. I fear we are land lubbers. One of us is, the captain says, a "Jonah." If he knew which one he would be tempted to throw him overboard. He lost his opportunity, though, just before we struck Bermuda reef, for an excellent whale came alongside within pistol shot—so near that we feared he would strike the vessel. I was certain the Doctor was our Jonah, and suggested he be thrown overboard, but he was equally confident that I was that prophet, and while we were disputing the whale disappeared.

After the calm came a fresh breeze, and we bowled along once more. We have been favored with sight of only a few birds, some beautiful terns, or sea swallows, which would come in the morning, chase us for an hour or so, then disappear until towards night. We baited a fish hook with pork and towed it astern, hoping they would take a fancy to it, but were not fortunate enough to get even a bite. After the third day they did not appear. At about latitude 25 we struck the first of the trade winds, which should blow from the northeast, but which were easterly from the first. Each day they blew stronger and stronger, until reaching latitude 20 we encountered a perfect gale. It was at midnight. Being unable to sleep, I went on deck. The vessel was tearing along fearfully under a double reef foresail and jib, plunging madly into the waters, which stretched out into the darkness black as ink, except where the sheets of foam made the blackness more conspicuous from contrast. The man at the wheel was silent and watchful; the mate, whose watch it was, clung to the rigging, his eyes peering ahead, glum and grim. I went out into the fore rigging, and there felt the force of the wind as it howled through the shrouds and drove the waves across the bows and clear over the deck load. There, above me, the sails bent far out over the water, the sheets creaking and singing with the tension.

Two degrees further south the wind drew further aft, and we shipped several seas, dashing into the cabin windows and down the gangway, setting everything afloat. In latitude 17 the flying fish, which have been growing more numerous every day, dart about us in flocks. The sea is in huge walls, which the schooner climbs, to descend again. Across these seas, from crest to crest, skim the flying fish, their fins flashing, silver sides gleaming in the sun; they dash against a huge wave, wet their fins anew, and renew their flight. I saw many fly upwards of a hundred yards without touching the water, save with their tails, which they would use to swerve them from one side to the other, or to give fresh impetus. Now and then a whole flock of little fish would dash out, looking like so many swallows, and I could see them as they plunged through a wave, gleaming white in the blue water and reappearing beyond. At night many came aboard, and we would find them badly mangled from the violence with which they struck. The temperature has not sensibly increased since leaving Bermuda, owing to the heavy winds, but it is much hotter in the sun. Rain squalls have become frequent, especially at night, and accompanied by violent gusts of wind.

Monday night, January 11th, we hove to, for we were in the latitude of our destination, and should be less than a hundred miles from land. The weather was thick, and our captain did not care to run for land in a foggy night. At daylight she was headed west, and at eight o'clock the first land was sighted—a mountain of fog towering up into the sky. Before a strong wind we rapidly neared the island, and in a couple of hours could distinguish green slopes, black gorges, and mountains with their summits in the clouds. A black cloud overhangs the whole. We pass close in by precipitous cliffs, down which is drawn the silvery line of a cascade. Delicious valleys disclose themselves, with bananas and cocoa palms fringing beaches of sand, and mingled with the dark green of the mountain side are trees in snowy bloom. Alternate calms and showers greet us as we draw near this tropical haven, and it is late ere we take a pilot, drop our anchor, and are at rest in front of the town of St. Pierre.

Our little schooner, after discharging cargo, keeps on to the South American coast to load with cocoanuts; the Doctor will soon return north again, while I will take passage on some coasting sloop to an adjacent island, where are forests of primeval growth, mountains that pierce the clouds, birds and butterflies of brilliant hues, and snakes and lizards of gigantic proportions—in short, a naturalist's paradise. There are, however, no mails there, and for several months I shall be deprived of papers and letters from home, and have no opportunity for writing myself. But we cannot have everything at once in this world, so I will be content to be a hermit for a year or so, believing that the deprivation will but enhance their enjoyment when once I am in the world again.

Later—I have taken a tramp ashore and into the woods a short ways, and the introduction I got was to anything but agreeable acquaintances. I had scarce entered a shady grove beyond the town, when a snake darted across our path, which my guide said was deadly poisonous; and a few rods further we came across a spider as large over as a saucer, covered with hair, and with a thousand eyes that gleamed like diamonds. Two humming-birds dashed by and hovered over some gorgeous flowers. I sat down upon a flat rock to admire them at my case, when my guide cried out in French (they all talk French here, even the children) that I was in danger. I didn't see it, but my guide turned over the stone on which I had been sitting, and I did see a centipede six inches long, with venom enough in him to set one into a fever. These are only a few of the residents of the woods; but they are said to be less plentiful on the island to which I shall go first, so I shall get used to them. Anyway, I mean to enjoy my life in the woods, and long to get out with gun and note book. One shouldn't mind such trifles as snakes and tarantulas, when wine is only a franc a bottle, oranges four for a cent, and cocoanuts two cents apiece.

Here is your health in health-giving cocoanut milk fresh from the tree! FRED BEVERLY.

St. Pierre, Martinique, Windward Island, Jan. 29th, 1877.

P. S.—I would like to acknowledge the courtesies of a few Bermuda friends. Capt. Masters, of Port Royal; Samuel Masters, Esq., of Hamilton; and R. A. Young, Esq. The latter gentleman is a New Yorker by birth, a resident of Hamilton, Bermuda, and well known to every sea captain that visits the island. If consulships go a-begging this year it is to be hoped that Mr. Young will be appointed to that office, as he possesses talents peculiarly fitting him for it. It would certainly prove a boon to Americans visiting Bermuda. There are several Americans in Hamilton, and the largest and best hotel there is kept by a New Hampshire lady—Mrs. Dodge, who is so well known to every visitor to Mt. Washington. Though I cannot speak from personal experience, the hotel is said to be well conducted and generally full. To the U. S. Consul at Martinique, Capt. Bartlett, I would take this opportunity of expressing my thanks for many favors. FRED BEVERLY.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, Feb. 10th, 1877.

Beef! Beef! American beef! is the refrain which is being sung through Great Britain. I observe that scarcely a mention is made in your papers of the subject which is being agitated from one end of the Kingdom to the other, and which is a perfect god-send for the penny-a-liners. One million and a half pounds of American beef entered the Mersey alone in one week, without mentioning the almost equal amounts which come by the way of the Clyde. It is very amusing to observe the various ways and moods in which this new movement is received. John Bull's pride is touched to think that he must look to the Yankees for his roast beef, a dish which he has come to look upon as being as peculiarly national as Magna Charta itself. Then there is the poor man, the laborer and the mechanic, who rarely sees meat save perhaps on Sunday, who thinks that now he shall be able to feast to his heart's content. But alas! beef has fallen but a penny a pound, and the rich imported steak or roast is not for him. Your Yankee beef is either of such excellent quality originally, or else it is so greatly improved by the voyage, that it has supplanted the home-bred article, and the aristocracy of the West End cry for American beef. Then there is another party who regard the innovation with dismay and mistrust. These are the farmers, the beef producers, and also the land owners, who lease their lands to the farmers and derive their income therefrom. These apprehend that if the importation increases prices for home-fed cattle will have to be reduced also, while the cost of production will remain the same, hence the land will not produce so much and rents must fall. The usual nonsense and ignorance regarding the United States is being displayed by the writers who get up the articles on this subject for the papers. The residents of Indiana and Kentucky must be delighted to know that many of them feed from 100,000 to

150,000 head of cattle; or rather *do not* feed them, for we are told that in those States the cattle feed on the natural grasses, getting no other feed than a little hay on exceptionally severe days in winter.

I observe that importations of another character are suggested in *Land and Water*. Your quail, ruffed and pinnated grouse, it is thought, would thrive in English covers. They all undoubtedly would, and so would the beautiful California quail. One remark, however, in the article alluded to I cannot pass unnoticed. The writer says that the ruffed grouse is a very hardy bird, swift on the wing, and *as difficult to shoot as a woodcock*. I should like to have that man in, say Pike county, Pennsylvania, for a few days in October and November, with the birds rising at from thirty to forty yards distance, and after quickly putting a tree between the gun and themselves, going "like a streak of greased lightning;" he would find after learning to kill them that woodcock shooting was but child's play. The same writer thinks that the prairie chicken, or pinnated grouse, would be better adapted for English preserves than the ruffed grouse. Herein I totally disagree with him. Not only is the latter, in my opinion at least, incomparably the better bird for the table, but I do not believe that the prairie chicken is adapted for the high civilization and extended and thorough cultivation of England. *Tetrao cupido* is a sort of nomad; he appears to prefer the outskirts of civilization. Years ago he left the Atlantic seaboard and preceded the Star of Empire on its western course. Like some of Cooper's heroes he lingers in the "settlements" only until the houses become numerous, and then seeks pastures new, where neighbors are more than rifle shot apart, and where the new soil brings forth such abundant crops that he can rightfully claim his share without robbing the farmer.

Virginia must look to her laurels. I have supposed that the Old Dominion had a monopoly of the tournament business in the present century, but the sturdy Briton is about to encase himself in the armor of his ancestors and enter the lists once more. In May there is to be a revival of the famous old Eglinton Tournament. Hurlingham is to be the scene of the jousts, and blue rocks and breech-loaders for the nonce give way to blunt lances and mail-clad steeds. The Prince of Wales will appear as one of the knights, his Princess, it is said, being the suggestor of the idea. The programme as given in the *Sporting Gazette* is as follows: "Four knights of the Red Cross who have just come back from doing battle with the Paynim in Palestine, will pit themselves against four knights who have remained at home to guard the safety and honor of the kingdom, and prove whether the home-keeping youths or the gallant Crusaders have the firmer seat and the more practised lance. The costumes will be gorgeous. The four Crusaders are to be attended by squires and pages, attired in all the fantastic magnificence of the East. Kensington Museum will be ransacked to supply Eastern arms and accoutrements—the splendid collection there having been placed at the service of the promoters of the tournament." But there is one innovation upon knightly custom to which true knights should never submit. That is the selection of the Queen of Love and Beauty by ballot instead of leaving the choice to the victor.

Speaking of Hurlingham reminds me of the gay doings at Monaco and Nice during the past few weeks. At Monaco pigeon shooting on a scale that would almost rival one of your "State shoots" has occupied the attention of sportsmen of celebrity from all parts of Europe and also of some from America. The principal event, in which the prize was worth not far from five thousand dollars, was won by an English gentleman, Mr. Arundel Yeo. His name, whenever I come across it, always reminds me of Chas. Kingsley and Amyas Leigh. He must be a Devon man. We have not in our country been accustomed to look on foreigners, that is other than Englishmen, as been skilful in the use of the gun; but if you should see some of these French and Italian gentlemen and noblemen kill pigeons you would be astonished. Still more would the wonderment of some of your crack pigeon shots be excited did they see the guns; 12 or even 14 bores, weighing sometimes as little as six and a half pounds, and loaded with three drachms of powder. The shooting is usually done from five traps and the distances frequently as high as 28 yards, with the use of both barrels. And the birds are killed as clean as with the old single-barreled "Cannons" which have scarcely gone out of use with you.

The "choke-bore" war is still being carried on in the columns of the *Field*, and one week the "chokes" seem to have it and the next the "cylinders." One point, however, appears to be generally conceded, and that is that for general shooting the left barrel should be choked or "modified."

Quite a stir has been made in racing circles by Lord Falmouth's proposition before the Jocky Club. "That no produce stakes or weight-for-age race to be entered for as foals, yearlings or two year-olds shall be open to foreign-bred horses, unless specially advertised to be so, or unless such horses were bred in those countries which throw open their races on equal terms to British horses." The object in this resolution is to force a reciprocity. For years past all racing in England has been open to the world, with a liberal allowance of weight for foreign-bred horses. But the French, in particular, while they have of late years carried off many of the richest prizes on the British turf, have kept their own races, with some few exceptions, closed against horses bred outside of France. Probably there is no man in England who could offer such a resolution with less danger of having his motives misconstrued and jealousy ascribed where only fair dealing is aimed at than Lord Falmouth. While successful in carrying off at one time or another all the great races, the starting or running of his horses is never influenced by the State of the odds. VAQUERO.

The Kennel.

THE KENNEL REGISTER.

ST. LOUIS, February 20th, 1877.

EDITOR FOREST AND STREAM:—

In your comments on my communication of February 1st you propose that the N. A. K. Club shall turn over all their pedigrees to your paper for registration and publication in your proposed stud book. The proposition is respectfully declined. I think if you appreciated the situation you would not have made such a proposition.

The National American Kennel Club is, or is intended to be, a representative body of men composed of those interested in breeding and raising pure bred dogs; and to be, as its name indicates, national in its character. It would bear the same relation to the breeders of dogs that the Jersey Cattle Club does to the breeders of Alderney cattle, or the American Association of Short-horn Breeders does to the breeders of short-horn cattle. That such an association is desirable I think you will not deny. That the N. A. K. Club is the only association of the kind in this country claiming to be national in its character I think you will admit. That it is as thoroughly national in its character as could be expected in so young an organization is not to be successfully denied. These facts being admitted allow me to ask, how is it possible for the N. A. K. C. to accept your proposition—turn over its pedigrees to you—to abandon all responsibility as to the genuineness or authenticity of all the pedigrees you may publish, and the supervision of the stud book to be left to gentlemen who are *not even members of the club!*

I think there would be no difficulty in arranging this matter satisfactorily to all concerned if it were not for the jealously and rivalry existing between the sporting papers; and they will be held responsible by the sportsmen of the country for the confusion and dissatisfaction which is likely to result from their conduct.

You know that from the time we met at the Baltimore Show up to the present time I have been trying to reconcile differences with a view to having co-operation and harmony in this matter. Having failed in that I see nothing left to be done but for the N. A. K. C. to proceed with the publication of their stud book; and if the committee on publication do their duty with freedom from prejudice and with justice to all I care not how many other stud books are published, their's, in the end, will be considered *the authority*. E. C. STERLING,

For the Com. on Publication of Stud Book.

We think that Mr. Sterling in his zeal for his club does not sufficiently appreciate our position in this matter. Before the National American Kennel Club was in existence we had established a Kennel Register, and had agreed with our constituents to publish from time to time, in book form, an abstract of the pedigrees entered therein. Subsequently a Western contemporary opened a similar book which it afterwards announced would be issued under the supervision and jurisdiction of the N. A. K. C., and our own enterprise was referred to as a mere money-making scheme, simply because we asked for a subscription to the book in the shape of a registration fee which was to assist in defraying the expenses of printing. Recognizing the fact that our motives *might* be so misconstrued we abandoned the registration fee. When it was proposed to us to hand over our pedigrees to be joined with those that were supposed to be the property of the N. A. K. C., we, believing that to do so would not only further the interests of breeders and sportsmen generally, through their being but one stud book, but would also have the effect of arousing a more general interest in the club itself, and hence strengthen it, were willing to accede to the proposition. We were informed, however, that a registration fee would be required for every pedigree printed. This placed us in the position of having either to pay the fee ourselves for all the pedigrees entered in our register or repudiate our agreement, neither of which could we do. When we proposed to publish the stud book and give it to breeders and owners without any expense to them beyond the cost of a copy we imagined that we were making a very liberal proposition, and such, we are glad to learn, is the general opinion among our readers. We are not informed what the cost of the book would be if published by the N. A. K. C., but it is an undeniable fact that our plan would have saved to each person registering a pedigree at least one dollar.

But to return to Mr. Sterling's letter. In his first paragraph he scarcely states the case fairly when he says that we proposed that the N. A. K. C. should turn over all their pedigrees to our paper for registration and publication in our proposed stud book. Such was not our meaning, or intention. Our proposition was (or at least so intended) that their pedigrees should be turned over to us, or to whoever should prepare the book for the press, *after they had passed through the hands of and been approved by their committee*, we undertaking to have the same office performed here for our own pedigrees. As for the relations which the N. A. K. C. bears to the breeders of dogs in general there is much that might be said. At present we will only repeat what we have said before, that we believe an error was made at the outset in not inducing a more general representation in the formation of the club. The people of this country are peculiar in some of their notions, and more than a hundred years ago expressed in the strongest manner their objections to taxation without representation. But if a precedent is required for our printing a stud book we will refer them to Bruce's Stud Book or the English Kennel Club Stud Book, the latter of which is edited by Mr. Pierce, Kennel Editor of the London *Field*, and is published from the office of that paper.

Mr. Sterling thinks that there would be no difficulty in arranging this matter satisfactorily if it were not for the jealousy and rivalry existing between the sporting papers. We are not aware of either jealousy or rivalry on our part, and are assured of being exempt from all responsibility in the matter. We shall do what we consider our duty, and adhere tenaciously to our rights without fear or favor. If there is any jealousy or rivalry affecting the interests of the N. A. K. C. (one-sided though it be) the club has only itself to blame for making the editor of one of the sporting papers its President. And we do not say this in an invidious sense, but merely from the point of expediency.

We might allude to the efforts made by this paper to advance the interests and improve the breeding of dogs, dating from its first issue, more than two years before our western contemporary came under its present management, and claim some consideration on that score; and we can only reiterate our assertion that the same motives influence us now.

In conclusion we would call attention to the point that whatever may be published the Kennel Register opened at this office is an accomplished fact. We are in possession not merely of a number of names of dogs and their owners, but of a volume which will always be the book of original record, and which contains the *pedigrees* of nearly four hundred dogs duly certified to by their owners or breeders, and which is receiving daily accessions.

DASH—THE PROPERTY OF GEO. C. COLBURN, ESQ.

DASH.—Dash, the subject of this sketch, was whelped in August, 1869, and is of a rich black and tan, white frill on chest, fore legs about one-third up strongly intermixed or spotted with tan. He measures 28 inches at shoulder, with good strong limbs and deep chest, and combines the English, Irish and Gordon strains. A few weeks after his birth he was given by his owner, Mr. H. A. Valentine, to his brother-in-law, Mr. W. L. Robinson, of this city, and by him thoroughly broken on woodcock, quail, grouse and snipe. When he was some three years old he was purchased by Mr. Geo. C. Colburn, of this city, in whose good hands he has not at all deteriorated. At first glance to a stranger he would not appear to be a very fast dog; but when you notice his immense stride, and the quantity of ground he gets over in such short space of time, you will then see that he is much faster than you at first sup-

posed. It was the writer's privilege to shoot quail and snipe over him last fall, and a better dog in every respect he would not wish to own. In the stud he has no superior his progeny turning out as well as could be desired. Few dogs in this country have had more game killed to them than Dash. The following is his pedigree:—

Colburn's Dash, black, tan and white.

Putnam's Dan, red and white.		Valentine's Fannie, black and tan.	
Paul Mead's Dash, red Irish.	Putnam's Nell, o. and w.	Falcott's Sport, o. and w.	Talcott's Nell, black and tan.

Dash. Kent bitch, redish red.

W. Watson's black and tan dog

Munkittrick, white & black bitch.

We cannot express complete satisfaction with our cut of Dash, for while those who know the dog would recognize him at once, a stranger would receive a wrong impression as to his general form. The fault is not that of the engraver, but is owing to the extreme difficulty of getting a correct portrait of a dog when the picture is an exact copy of a photograph. The effect of the latter is to give undue size to that portion of the dog nearest the camera, so that if the dog is not standing exactly "broadside on" the fore shortening in the picture makes him look short, and enlarges the fore part of his body at the expense of his hind quarters.

SLEAFORD.—We had the pleasure of landing, on Monday from the steamer City of Richmond, for our friends of the St. Louis Kennel Club, the pointer Sleaford, winner of the first prize in the small pointer class at the late Birmingham Bench Show. Sleaford is a liver and white dog, bred by J. H. Whitehouse, Esq., and is by his celebrated dog Macgregor, out of his Nina; she by Hamlet out of Lort's Sal. For a "small class" dog, Sleaford is a remarkably large one, weighing, we should think, considerably over 50 pounds in his present condition. He is not a taking dog at first sight, but grows on you. He is decidedly coarse, with very muscular thighs and good legs, but his head is inferior to Sensation's, and we think the latter would beat him on the show bench. Sleaford shows more quality in his stern than elsewhere, and although being scarcely up to our pre-conceived ideas of a Birmingham first prize winner, is undoubtedly a high class dog, and looks like a workman.

IMPORTING DOGS.—For the benefit of such of our readers as may meditate importing dogs from England, we would say that we have been notified by the Custom House authorities that a strict compliance with the law will be hereafter required. Dogs imported for stud purposes are admitted free of duty, *provided*, a certificate to that effect from the U. S. Consul at the port of shipment accompanies the application for a free permit to land. The dog must be on the ship's manifest, and a bill of lading be made out for him. Unless these conditions are complied with he will be liable to seizure, or at least to payment of duty.

—Capt. Foster, of Leesburg, Va., has presented our friend Dr. Ellzey, of Blacksburg, Va., with his elegant setter bitch Minna, by Rock out of Kirby, first in her class at Baltimore. Dr. Ellzey thinks of breeding Minna to Pride of the Border.

—Mr. Wm. M. Williams, of Springfield, Mass., has received as a present from George Delano, of New Bedford, one of his Doll-Charm pups. Doll, the mother, is of field trial breed, and of Mr. Delano's own importation. Charm, the sire, is a pure Laverack out of Pride of the Border and Fairy.

MR. MACDONA'S DOGS.—It will be seen from our advertising columns that Mr. Macdona is offering, at very low figures, his kennel of Irish setters, including Rover, Ruth, Ralph and River, all entered for the Field Trial Derby. As these dogs possess the same blood as Plunkett it is an excellent opportunity offered to our breeders.

—Mr. Wm. Jarvis writes us from Claremont, N. H., that the following names are claimed for the puppies by Plunket out of his Kathleen:—Mr. Geo. A. Bugney, of Stuyvesant Falls, N. Y., claims name of "Kathleen II," for his bitch puppy. Mr. C. A. Hayden, Rochester, N. Y., claims name of "Musett," for his. Mr. Treat Potter, of Manchester, N. H., claims name of "Patsey," for his dog puppy. Mr. B. F. Clark, of Manchester, N. H., claims name of "Tam O'Shanter," for his. Mr. Franklin Sumner, of Milton, Blue Hill, Mass., claims name of "Red Wood," for his.

COUNTESS.—We have received from Mr. Gillespie the following letter, relative to his claim of the name of Countess:—

"My attention has just been called to Mr. Dilley's letter in your issue of the 8th inst., asking me to show a prior right to the name "Countess for my liver and white pointer bitch, than December 20th, 1876. I would state for Mr. Dilley's information, that my claim is recorded about two months previous to that time in FOREST AND STREAM, *Rod and Gun* and *Chicago Field*. I regard Mr. Dilley's request a very proper one, and would feel obliged to surrender the name to him were I not able to show a prior right to his (December 20th). Yours,

R. H. GILLESPIE.

Mr. Chas. E. Coffin of Muirkirk, Maryland, writes us that his orange and white setter bitch "Belle," whelped on the 14th inst., 7 pups by Reyburn's orange and white setter, "Shot," four dogs and three gyps; since then she overlaid one of the dogs, leaving three of each kind.

THE KENNEL REGISTER.—The following is a list of the dogs whose pedigrees have been entered in the Kennel Register since the list was last published. Next week we shall publish the table, giving an abstract of the pedigrees of the third one hundred dogs registered:—

SETTERS.

Dick, red, Ed. Lohman.	Nell, red, W. Grinder.
Plunket, red, Carrie, do. } W. J. Farrar.	Climax, C. H. Elliott.
Nell, black & tan, }	Dick, red, L. C. McClay.
Raph, do. }	Kate, red, H. B. Plumer.
Grouse, black & tan, W. B. Sutton.	Bess, red & wh., H. C. Glover.
Luke, black & tan, J. G. Skinner.	Marquis, bl & wh., do.
Bute, white, r. B. Farnsworth.	Sheila, red, B. F. Dorrance.
Frank, lemon Belton, A. C. Rogers.	Tromps, red & wh., G. J. Smith.
Forest Rose, blue Belton, J. H. Cariff.	Tom, red, Kenneth G. White.
Guess, wh. & chestnut, F. Stearns.	Lady, red & tan., do.
Countess, do. E. Bennett.	Dan. ch. & wh., do.
Wynne, wh. ch., J. N. Dodge.	Marquis, bl. & wh., W. J. Wright.
Rose, blue Belton, F. B Farnsworth.	Kathleen, red, Wm. Jarvis.

EL CAZADOR ON RETRIEVING.—Our Los Angeles (California) correspondent sends us the following description of the doings of his "bull purp":—

"I have seen recently in your paper several notices of retrievers, and if in order would like to speak a good word for my dog Boze. Boze was sired by a Russian terrier, and is out of a full blooded English bull bitch, has no education except to keep his mouth shut and follow wounded deer and sich; is now about seven years old, and weighs about fifty pounds. Last year on the mountain I shot at with my rifle and wing-tipped a mountain quail. The bird ran off into thick brush. I found a spot of blood on its track, showed it to the dog, he took the trail, followed about two hundred yards, and brought me the bird in his mouth. We then entered into articles of agreement by word of mouth and tail shake, (did you ever hear of a dog with "a speaking tail?") he to retrieve all quail shot by me. I to have all with the heads shot off, he to have all shot through the body. (He got more than I did, you bet!) He stuck to his contract like mud, and one day when I tried to (being short of meat) cheat him, took the quail out of my hand and eat it. One evening last spring he followed me to a snipe ground near the rauche house, and retrieved in just as good style as any setter could have done, and without breaking a feather, thirteen jack-snipe. Last week when quail shooting about half a mile from the house, I found I had forgotten one of my gloves; showing him the fellow and my bare hand, I sent him to the house, and in twenty minutes he returned with one of Tom Brown's gum boots. Let facts be submitted to a candid world. EL CAZADOR.

PROPERTY IN DOGS.

A correspondent writes us from Libby's Neck, Scarboro, Me., regarding a case of cruelty to animals, as follows:—

"Many of your Boston readers know 'Prout's Neck' of old as a fishing and shooting ground, and a favored few perhaps remember when Dale Loring, the crack shot of Massachusetts, and others, assembled at the shanty on Scarboro marshes during the fall shooting. The rocky promontory is now known as Libby's Neck to most visitors from New York and Boston who go there because it is not a fashionable place, but affords all the attractions of good sea bathing, fishing and shooting. It is within a convenient distance for excursion parties from Portland. Bass, cod, pollock, tautog and cunners are taken with hand lines from the rocks. The place itself is all that one could desire as a cool and quiet retreat during the summer, and were it not for an incident which lately occurred at the Libby House might be called perfect.

One would suppose that the resident natives, from association with cultivated people, would not show traits of barbarity in their treatment of guests. The killing of a pet dog—a skye terrier of value attached to a family from New York—has caused intense disgust and indignant remonstrances from all here. But I will give the facts as related by a lady:—

"About five o'clock the rain stopped a little and Johnnie took Jip out for an airing. He had hardly been gone ten minutes when he ran breathless back to my room to say Jip was dying. He had chased and killed one of Tom Libby's chickens, upon which he took his gun and shot him, poor little Johnnie standing by and begging him not to do it, telling him he would pay for the chicken. But he would not listen, he was so angry, and the little fellow was dead when we reached him. All the people in the house are perfectly indignant at such brutal conduct; all liked Jip, and he made us no trouble from the time we left New York."

This may serve as a warning to sportsmen who visit Libby's, and make them cautious about trusting valuable dogs near Tom Libby's house, where chickens are high-priced and pet dogs shot on sight. J. A.

TO CLEAN BRASS SHELLS.—A correspondent sends us the following receipt for cleaning brass shells:—

"One ounce Cyanuret potassum, one pint of soft water, "dissolve;" put this into a quart preserve jar with a glass cover. Set it down by the fire where it will get warm, put the shells into it, as many as it will hold, for twenty minutes or half an hour; take out with a stick and souse with warm water two or three times; then dry the shells before a hot fire; they will come out perfectly clean. Set this mixture away for future use and mark it "poison." W. P. W.

—Seth Green has put over 100,000 salmon trout into Lake George the past week, and will add 50,000 brook trout by the middle of March.

Rifle.

RIFLE NOTES.

Latest! A new theory on "Choke-bores." Wanted! A solution of the cause of the unaccountable misses in long-range shooting.

The American riflemen, with but few exceptions, are in favor of challenging an Imperial team from Great Britain.

The straight shells are advocated by many rifle makers, in place of the "bottle-necked" ones for the long-range rifles.

The scores should be well kept during the approaching season. No less than twenty different score-books are offered for sale.

Washington's birthday was celebrated at Creedmoor by Weber, Fulton, Jewell, Hennion, Lamb, Walters and Fisher. They shot over the eight hundred, nine hundred, and one thousand yards ranges.

Conlin's duplicate score cards, similar to the ones used in the competition for the selection of the American team and the International matches of last year, have been adopted by a number of rifle Clubs throughout the country.

Hyde, one of Creedmoor's crack shots is south, introducing one of the popular rifles of this part of the country. His ill-health prevented his being on the American team last year.

A meeting of the members of the Amateur Rifle Club is called to take place this week. The object is to settle the preliminaries for the coming matches of this year, Major Leech's proposition, and the propriety of challenging an Imperial team will be discussed.

Shooting Clubs are "all the go" among the various business houses of this city and Brooklyn. The dry goods and insurance men take the lead. A Club formed of gentlemen, employed in the building of Arnold, Constable & Co., enjoys the reputation of having the best team. They are open to challenge from any team, to be composed entirely of gentlemen connected with business houses of this city or vicinity.

At the Morsemore rifle range a fish-pond has been constructed, and young trout are being raised in it. In a short time the rod will be a companion of the rifle with the frequenters of this range.

At Conlin's Gallery the following excellent shooting has been made lately—string measurement of twenty shots from the center of bullseye to the centre of shots: C. E. Blydenburgh, 14½ inches; William Hayes, 16 5-16 inches; C. A. Cheever, 17 1-16 inches.

Several new things on position are finding favor among the long-range Creedmorians. One of them is to bring the left arm in *front* instead of behind the head to grasp the "heel plate" of the rifle, so as to protect the eyes from the glare of the sun. Dr. Shaw, one of the "crack" shots of New Orleans, is believed to be the originator of this novel and, many think, valuable idea.

C. D. Hodgeman made at the Creedmoor range forty consecutive bullseyes with rifle, lying down position, distance five hundred yards, during the winter.

The N. R. A. will issue their shooting report for '76 *soon*. Perhaps the delay in getting it out is owing to the bad taste of advertisers.

The Jamaica Rod and Rifle Association of Long Island, had a match on Washington's birthday. The shooting was extra fine. J. Crane made 48 out of possible 50, off-hand, at two hundred yards range.

The Helvetia Rifle Club, of New York, celebrated the day by having a prize shooting match in Schutzen Park, at Union Hill, N. J. C. Moltman made the highest score of twenty-five bullseyes.

—A special meeting of the Amateur Rifle Club will be held at the Seventh Regiment Armory, corner of Third avenue and Sixth street, this evening at 8 p. m., to consider the invitation of the Irish National Rifle Association to send a team to Ireland during the present year, and to transact such business as may be brought before the meeting.

—The Executive Committee of the N. R. A., at a meeting held on Saturday last resolved to notify the teams which shot in the Centennial championship match and the British Rifle Association that the next match will be shot at Creedmoor in September, 1877, under the same conditions as the first match. A letter was read from Major Leech, in which he suggested that the next match for the medal be shot on neutral ground

THE GALLERY CHAMPIONSHIP.—Messrs. Cheever and Blydenburgh organized, last Monday evening, February 19th, the first of what may be in a short space of time very popular and interesting matches to the "indoor" riflemen of this city for the "championship." The conditions for the matches are as follows. The contest will consist of five minor matches, to be shot on the same evening, viz.:—

10 shots; rifle 22 cal.;	110 ft.,	200 yds.	Wimbledon	target.
" " "	" "	"	Ready measurement	"
" " "	" "	75 "	200 yds. Wimbledon	"
" " "	" "	"	Ready measurement	"
" " "	" "	"	" "	"
" " "	" "	"	Most bullets hit.	

Ties will be decided on the Wimbledon targets according to the rules of the N. R. A. On the ready measurement target, the one with the shot farthest from the center of the bullseye to be last. On bullets, by shooting five more shots.

The winner of three more of the above minor matches to be the champion gallery shot in this city till challenged and defeated, according to the following terms:—

The matches will be for a valuable gold badge, to be held by the winner, who is subject to challenge from any one. The challenger to deposit fifteen dollars ($15.00) at Conlin's Shooting Gallery, 930 Broadway, from which amount the expenses of shooting will be deducted, and balance with badge go to the winner of match, and such winner be open to challenge on conditions as above, at Conlin's Gallery.

Challengers must give at least one month's notice, unless otherwise mutually agreed upon between challenger and challengee. No challenge to be given which will make it necessary to have the match shot between June 1st and October 1st of any year.

In case of the inability of the holder of the badge to shoot at the time challenged, the challengee shall take the badge by default on payment of price of one hundred shots to the gallery, but shall be obliged in case of such default to shoot a match within one week from the time of so winning, in case he shall be so challenged.

All question of disputes or additional rules (if necessary) will be decided on by a Committee of three, viz.: Charles A. Cheever, C. E. Blydenburgh, James S. Conlin.

The following are the scores of the first of the above mentioned matches:

110 FEET DISTANCE.

CHEEVER.	BLYDENBURGH.
4 5 5 5 4 5 5 5 4—44	4 5 5 5 5 3 3 5 4 3—42
Total measurement, 10½ inches.	Total measurement, 10½ inches.

75 FEET DISTANCE

4 5 5 5 5 5 4 4 3—45	5 4 4 5 4 5 5 5 5 5—47
Total measurement, 6 inches	Total measurement, 6½ inches.
0 0 1 1 0 0 0 1—4 bullets.	1 0 1 1 0 0 1 0 0—4 bullets.

It will be seen by the above, that they were even on the two hundred yards Wimbledon red, targets and bullets, and the match was really decided by the ready measurement targets through a difference of one inch.

Mr. Cheever is now the champion gallery shot of this city, and is open to challenge.

NEW YORK—*Jamaica, Feb.*, 22.—The Jamaica Rod and Rifle Association commenced practice on Washington's Birthday for the season of 1877. The following is the score made at 200 yards, off-hand:—

Name.	Score.	Total.
J. M. Crane	5 5 5 4 4 5 5 4 5 4 5 4 5 4 5 4 5 5 5—92	
Thos. Loyd	4 4 5 4 5 5 5 5 5 4 5 5 4 5 4 5 4 5 5—91	
L. R. Duggan	5 4 4 5 4 4 4 5 4 5 4 4 4 5 4 5 5 4 5 5—89	
W. S. Einendorf	4 4 5 4 4 5 5 5 5 4 4 5 4 5 4 5 5 4 4—89	
W. G. Cogswell	4 4 5 4 5 3 4 5 4 5 5 5 4 4 5 5 5 4 4—88	
Geo. Hicks	5 4 4 4 4 4 4 4 4 4 4 4 4 5 5 4 5 4 5—85	
G. H. Creed	5 4 4 4 4 5 4 4 5 5 5 4 5 4 4 4 0 5 4—81	
Geo. Dawson	4 4 5 4 4 4 4 4 4 4 5 4 4 5 4 4 3 4—83	
Thos. Rogers	4 4 4 4 4 4 4 5 4 5 4 4 4 4 4 4 3 4 4—81	
J. B. Fleury	Withdrawn 5 5 4 5 4 5 4 4 4 4	

These are probably the best scores ever made under the same conditions.—ED].

MILEY'S GALLERY.—The tournament which commenced at the above Brooklyn Gallery on Jan. 22d ended on Washington's Birthday. The following is a record of the best six targets, with names of winners of the prizes:—

Name.							Total.
Chas. H. Johr	46	46	46	46	46	48	278
J. C. Kingsley	45	46	46	46	46	46	275
J. W. Wallis	41	45	45	45	46	46	271

The above scores are out of a possible 50 in each ten shots. The first prize, a handsome sportsman's cup; the second a silver set, and third, gold and silver medal. A match for lying down position will shortly take place.

OHIO—*Tiffin, Feb. 17th.*—The shooting fraternity of that vicinity have been having considerable sport since New Year's, shooting for turkeys. We have had from one is two matches a week since then, and now the strife is between the east side of the river and the west. So far the west are ahead. Next Thursday, the 22d, we have another match, and each side seems determined to do its best. We expect to organize a rifle club here soon. I think it will be an easy matter to raise a club of fifty. A Mr. Reinhard, of Londonville, O., has sent us word that he will be with us on that day with half a dozen guns of his own make, and says he will shoot against any of Remington's breech-loaders from 100 to 1,000 yards. His guns are muzzle loaders. BUCKSHOT.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.

PIGEON MATCHES.

THE PHILADELPHIA TOURNAMENT.—We ran over to the Quaker City on Washington's Birthday to witness the grand pigeon shooting tournament, advertised to take place on that day. After a ride of three hours it was rather discouraging to find that another railroad journey was necessary to reach the grounds. But at last the New Hunting Park was reached, and the ground traps found arranged in the middle of the oval formed by the race track. Why the side of the Park by the Grand Stand was not selected we are at a loss to understand. There seats would have been found for most of the spectators, and the crowding over the ropes that would have disgraced a prize fight, might all have been avoided. In fact, if all "tournaments" are to be conducted after the manner of this one; the sooner they are abandoned the better, or else have some one in charge who can enforce order and give both shooters and spectators a fair chance. The great lion of the day was, of course, Captain Bogardus, who returns from his Pacific trip looking as robust and hearty as ever. Many of the contestants used the old-fashioned, sing e-barrelled "cannons," shooting seven drachms of powder and the full allowance of shot mentioned in the conditions, which were as follows:—

Sweepstakes, open to the world, $50 entrance, fifty birds each. H. and T. traps (six being placed), 1⅛ ounce shot, powder unlimited, any gun, 21 yards, 80 yards fall, and Rhode Island rules to govern; value of sweep, $800, of which $350 to the first, $225 to the second, $100 to the third, $75 to the fourth, and $50 to the fifth.

The following score gives the result:—

Name.	Shot at.	Killed	Missed.
Miles L. Johnson	50	44	6
Richard Woods	50	43	7
Frank Kleintz	50	43	7
A. H. Bogardus	50	42	8
Wm. Carson	50	41	9
John Louvatt	50	41	9
Jesse Glover	50	40	10
Wm. Greenwood	50	40	10
John Jordan	50	39	11
Mozet Edwards	50	39	11
Robt. Cornell (retired)	48	38	10
E. L. Eberhardt (retired)	44	31	13
Fred Pearson (retired)	43	29	14
C. B. Louvatt (retired)	43	29	14
S. H. Turrell (retired)	42	26	16
Benj. Morton (retired)	43	25	18

Johnson and Woods each received $287.50; Kleintz, $100; Bogardus, $75; Carson and John Louvatt, each $25. These amounts do not include the cost of the birds.

Referee, William Schuyler, Philadelphia. Judges, William Whitehall and William Wells, Philadelphia. Time of shoot, first day, 2h. 45m.; second day, 5h. 48m. Total, 8h. 33m.

—A match was shot at New Dorp, Staten Island, on the 23d, inst. between members of the First New York shooting Club. The conditions were six birds each, 21 yards rise, and the result as follows:—

Name.	Total.	Name.	Total.
J. Kuntz	2	A. Kuttenbach	3
L. Marsch	3	H. Schwinn	3
J. Bohling	4	H. Berlan	3
J. Rubsam	2	F. Schiller	3
Chas. Braun	5	H. Gennel	3
John Ecken	4	H. Zahn	4
H. Hemmer	4		

PENNSYLVANIA.—A pigeon match was shot between Messrs. Al. Ranch, of our city (Lancaster), and Miflin Wright, of Columbia, last week, for the championship of Lancaster county and $100. The birds were a very fine lot, quick to get away, and required quick shooting to bring them to grass. The score was to have been at 21 birds, but only 15 were shot at. Appended is the score:—

Name.	Score.	Total.
Ranch	1 1 1 1 1 1 1 1 1 0 1 1 1 1—11	
Wright	1 1 0 1 1 1 0 1 0 0 0 0 0 0—7	

C. M.

"CAPTAIN BOGARDUS IN CALIFORNIA."—In your issue of February 8th, you quote an article from a San Francisco correspondent, who does injustice to our sportsmen generally. If any such remark was made—"and they were bound to beat the gallant Captain by fair means or foul"—it was not by any representative sportsman, and should not have been repeated. The Captain met with hospitable treatment while on this coast, and the introduction of new rules under which to shoot, was a point in his favor that his reputation should have waived. It has been a custom (and a bad one) with most of our shots, to bring the gun to the shoulder, sight and lower it before giving the word "pull," particularly so with the Captain's opponent in the match referred to, and this loses the birds by the Prairie Club Rules under which the match was shot. Without going into particulars on the disputed point—which was unfortunate for both parties, and neither was blameless—I pass to your remarks about our quail, which may in your own language be termed "perfect nonsense."

Have you or any friend of yours tried them? My experience as a shootist, running through a term of thirty years, east and west, gives me reason to believe that California quail *are* harder to bag than any game bird found east of the Rocky mountains, owing as much to the vitality of the bird itself as to the character of the cover where it is generally found, and the like of the latter, you much to be envied sports of the east never see. Climb to the top of some large chesnut tree, and while hanging on with foot and hand try to captivate single wild pigeons as they pass right and left; it will give you a fair idea of the surroundings under which quail shooting is accomplished here. They are most frequently found on steep hill sides, where, under cover of wild sage, chimaselle and scrub oak, they tax to the utmost the endurance of man and dog, seldom going into the valleys except for water, and always flying to the hills when flushed.

Ask Captain Bogardus to give you the result of his first California quail shoot with Jonny Orr! It will give you a more extended view of the sport, and probably correct the errors of your remarks.

"Lord Dundreary" (Sothern), Sir John Rae Reid, Sandy Austin and John Orr, start to-day for a hunt after the "blasted birds," and if their success is commensurate with the beauty or the day, they will come back with full traps. Come out and try your hand; you would enjoy the sport —*after a few days.* Yours, ELLIOTT.

[We still hold to our original opinion regarding the California quail being no more difficult to kill than our own. Our statement was based upon four years almost constant shooting in the fall and winter months in various parts of the State. Our correspondent's shooting must have been confined to one particular locality. If he has shot in the San Joaquin valley, or more particularly in the southern counties, he would have found the birds in vast flocks, generally first seen running in comparatively open ground, when once scattered and driven into cover, they may be flushed and killed as easily as our own birds; that is, at similar seasons. With us quail are not shot after January 1st, while in California they are, or were a few years since, shot well into spring. We will grant that at that season, the birds being tough and strong on the wing, they are then difficult to kill and many birds are lost, particularly in localities where the ground is honey-combed with rabbit and squirrel holes, into which the wounded birds find their way. This opinion is fully confirmed by Capt. Bogardus.—ED.]

A report of the match of the Saratoga Rifle Club on Washington's Birthday, is unavoidably left over until next week.

MASSACHUSETTS—*Salem, Feb. 26th.*—The remarkably long spell of fine weather we have lately enjoyed has carried off much of the snow from the woods and fields, and the ice from our harbor, which last named place at present holds a goodly number of winter water-fowl, including many herring, gulls, whistlers and shelldrakes. TEAL.

NEW YORK.—*Meacham Lake, Franklin Co., Feb. 19th.*—Since my last letter (January 20th) we have had thaw and freeze, till we now have the hardest crust I have ever seen at this season of the year. This, with two feet of snow underneath, makes it almost impossible for the deer to move, and they are suffering terribly, both from lack of food and from their enemies, men, dogs and wolves. A man on snow shoes can run down and kill a deer in a very short time. I cannot learn that there has been any killed in this town, but have heard of several being killed in an adjoining town; and the offenders are to be given the full benefits of the law.

Partridges and all kinds of small game are doing better. We have had very little snow this month, and the whole month has been very mild for this section. We have had but three mornings when the thermometer indicated zero, and each day ran up to 15 or 20° above. A. R. FULLER.

FLORIDA.—*St. Augustine, Feb. 17th.*—On Wednesday of last week, M. T. C. Rowe, accompanied by M. Loriliart, and Mr. Greatorex, after a brief absence from the city, returned with 43 English snipe, besides other birds. Again on Saturday, Mr. Rowe, with Mr. Greatorex, brought home 92 snipe, and once more on Wednesday last, killed 83. These performances completely astonish the sportsmen, and for some days have been the absorbing topic among them. JOE.

—Mr. Edgar, and other gentlemen of the St. Augustine (Florida) Gun Club, have established the range, dove cot, &c., at Johnson's five mile house.

Orange County, Feb. 17th.—Deer, turkey, ducks and quail are abundant this year, and I am surprised that more sportsmen don't find their way into the interior of Orange county. Some day they will, and then they will regret the sport they have lost by staying away. R.

WASHINGTON TERRITORY—*Seattle, Feb. 8th.*—We have six or seven varieties of grouse here. Three dozen Jack snipe is only a good average day's shooting for December. The snipe breeds here, but in the mountains close to the snow belt. We have no woodcock nearer than Japan, whence they are brought in ice and charcoal by the stewards of the P. M. S. S. Co.'s steamers to San Francisco. Their plumage is exactly like your eastern bird, but the male woodcock weighs 11 and the female often as high as 14 oz. Quail are not so plenty here as in California, but if your eastern friends want a Pacific coast tour, give 'em a note of introduction, and outside of quail shooting I can guarantee better sport than can be had in California. T. B. M.

ENGLISH SNIPE AROUND.—An attentive correspondent writes:—

"It may possibly interest some of your readers to know that there are already a few English snipe as far north as this. On the 22d I found two brace in Orange county, and managed to bag one brace. They were in good condition, but much wilder than one would have expected. From the way the snipe got up and the flight they took I should imagine they had determined to return south. The little stream alongside which I found them was completely frozen over two days since, as in fact was all the rest of the country, so that these birds could not have been here all winter." J. E. G.

A GOOD TARGET.—A correspondent reports as follows upon the change effected in his gun by re-boring. An ounce and a quarter of No. 7 shot contains but 364 pellets, so there must have been some mistake as to the charge:—

"Speaking of targets, I had a 10-gauge Purdy breech-loader rebored by Lefever; couldn't kill anything with it before he took it. Four targets give respectively, at 30 yards, target 20x30 inches, 4½ drs. powder, and 1½ ozs. No. 7 shot (Eastern), 318, 345, 345, and 390 pellets. Lefever said the shells were loaded 1½ oz; must have been 1¼." *Decatur, Ill.* T. L. HAYDEN.

A GUN TRIAL.

NEW YORK, Feb. 24th, 1877.

EDITOR FOREST AND STREAM:—

Thinking you and your readers are always interested in gun trials I give you the items below without comment. The shooting was done by and in the presence of four gentlemen sportsmen, and owners of the guns. There was a very high wind at the time which spoiled and reduced the average of the targets somewhat. Powder used, Dupont's Ducking.—Fox—$125 gun, No. 12; 8 lbs.; 28 inch bbl.; 3½ drs. powder; 1⅛ oz. No. 9 shot. Average, 300½ pellets; 30 inch circle; 50 yds. Fox—$75 gun, No. 10; 9½ lbs.; 30 inch; 4 drs; 1⅛ oz. shot; No. 9. Average, 353½. Fox—$50 gun; No. 12; 8 lbs.; 28-inch; 3½ drs.; 1⅛ oz. shot; No. 9. Average, 275. Parker—$150, slightly choked; No. 10 gauge; 4 drs.; 1⅛ oz. No. 9 shot. Average, 294½. Besides these there was shot an English gun altered by Nichols & Lefever. I have not these targets, but they were about the same as above. With Kay's concentrator and 4 drs. powder. Average, 398; with large shot the average of all guns was in about the same proportion. RANDOM SHOT.

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York. Adv.

National Pastimes.

BASE BALL—THE CANADA CHAMPIONSHIP.

A Canada paper in referring to the coming struggle for championship honors in the Dominion says: "The rivalry that has existed between the leading clubs, in Ontario, in years past, will lose none of its intensity the coming season. In the early days there was red hot opposition between Hamilton and Woodstock; later, Guelph and Dundas; and then finally Guelph and London, between whom the war is now waging. Until this last fight the contests, it might be said, were conducted on an amateur basis, but now both of these clubs have thrown off the gossamer mask, and boldly taken their stand among the professional nines of America. It is a matter of history that London won the Canadian championship last year, having without doubt the strongest team in this country. Guelph is not willing to lose the proud name it held for years, as being cock of the walk, and this year has made extraordinary exertions to re-capture the whip pennant, by importing quite a number of strong players from the United States. London has also strengthened its team, and the games between these two clubs will be classed with the most exciting sporting events of the year. The other clubs who aspired to the championship honors last season appear to be in a torpid state. The chances of Kingston, Toronto, or Hamilton, against either London or Guelph, without the assistance of salaried players would be quite small, and if no changes are made in the championship rules, it is altogether likely the two professional clubs will have the fight all to themselves.

"The players of the London and Guelph nines for 1877 will be as follows:—

"*London—Tecumseh.*—Powers, c, Captain; Goldsmith, p; Bradley (late of the Bostons,) 1b and change pitcher; Somerville (late of the Louisvilles,) 2b; Doescher (late of the Buckeyes of Columbus, Ohio,) 3b; Knodell, (late of New Havens,) s s and change catcher; Dineen, c f; Hunter, r f; Hornung, l f; and Leary, sub.

"*Guelph—Maple Leaf.*—Scott Hastings, (late of the Louisville,) c; Sullivan, (late of the Detroit Ætnas,) p; Lapham, 1b; Gillespie, (a Chicago graduate,) 2b; Dixon, (late of the Taunton and Auburn nines,) 3b; Welsh, s s; T. Smith, l f; W. Smith, c f and change pitcher; J. Hewer, c f; and, probably, Houlding (late of the Ilions,) r f and change catcher."

—The second annual meeting of the Canadian Base Ball Association will take place in Toronto on April 5th. Clubs belonging to or desirous of joining the Association should not be tardy in organizing and remitting the annual fee of $2 to the Treasurer, Mr. W. F. Mountain, Toronto.

The Convention will doubtless adopt the League code of rules.

—George Hall has signed with the Louisvilles, in which case their nine will be as follows. Delvin, pitcher; Snyder, catcher; Latham, Gerhardt, and Hague, on the bases; Craver Lafferty, short stop, with Ryan, Hall, and Schaffer, in the out-field, and Crawley as the substitute.

—An effort is being made in Philadelphia to raise a strong co-operative professional nine that will prove worthy rivals of the Athletics. The veteran, Tom Pratt, is mentioned as the leading spirit in this new club, which will be selected from the many disengaged professionals now in Philadelphia, including McGinley, Abadie, Quinton, Henbel, and Cuthbert. An excellent nine could be easily raised, and the Athletics will serve their own interests best by encouraging the formation of an honest rival nine.

—About two weeks ago a young lady broke through the ice of a deep skating pond near Toronto, and a young man rescued her at the risk of his own life. As the half-drowned girl was recovering consciousness her agonized father arrived on the spot. Taking one of her cold, white hands in one of his own, he reached out the other for the hand of her rescuer, but the young man realizing his danger, with one frightened glance broke for the woods, and was soon lost to view. He has not been heard of since, and it is supposed that he is traveling in the United States under the false and hollow name of Smith.

A TOAD-EATING FLY.—Nature, among those occasional odd freaks wherein she seems to overturn her own laws, often reverses in the strangest manner the conditions of destroyer and prey. Toads, it is well known, live on insects, and for this reason are valuable aids to farmers and gardeners in protecting their crops. Lately there has been discovered an insect which lives on toads, and which afflicts those reptiles in a way that suggests the concentrated revenge of the whole insect class. It deposits its eggs on the eye of the toads, and the larvæ, in the form of minute white worms, devour not only those organs but the nose and jaws of the unfortunate batrician. Curiously enough, the toads do not seem to suffer, but continue their usual habits apparently undisturbed. The name *Lucilia bufonivora* has been given the fly.—*Scientific American.*

—Brown, Sen.—Well, Fred, what did you see during your trip abroad?

Brown, Jun.—Aw—'pon m'word, don't know what I saw 'xactly; only I know I did more by three countries, eight towns, and four mountains than Smith did in the same time.

—Fishmonger (to thrifty housewife)—Well, fish is dear, mum; you see it's a-gettin' werry scarce in conkence 'o these 'ere aquariums.

—A Minnesota editor says that a man came into his office to advertise for a lost dog, and that such was the wonderful power of advertising, the dog walked into the office while he was writing out the advertisement.

Baths.

Russian Vapor, Marble, Baths.

NO. 23 EAST FOURTH ST., NEAR BROADWAY

The most extensive, luxurious and popular baths on this continent. Call and see the testimonials, signed by the most eminent physicians of the city, to their value as a remedy in Cold, Catarrh, Sore Throat, Gout, Rheumatism, and many other afflictions which originate in an inert skin. dec7 3m

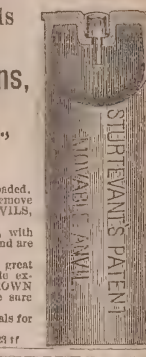
New Paper Shell Conical Base.

WILLIAMS' PATENT.

Manufactured by the ST. LOUIS PAPER SHELL M'F'G CO., office 2,239 De Kalb street. The advantages claimed for these shells are: Cheapness, a saving of 25 per cent. in the use of powder, less recoil. These shells are equal to the best English, and 3¼ drachms of powder will do the work of 5 drachms in any other shells. The sizes made are No. 10, 2½ inches; No. 12, 2¾ inches. Longer shells made to order at extra cost. Ask your gunmakers for them and use no others. Shells are not malleable. Sample 100 will be sent by express on receipt of $1.30 for 10s or $1.15 for 12s. Feb 21-1y.

Paper and Metallic Shells



FOR

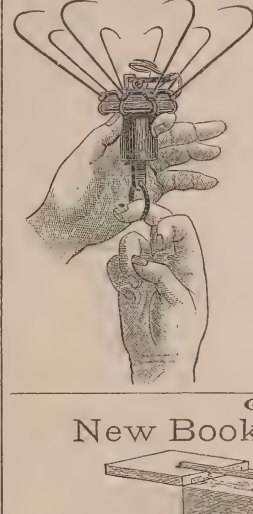
Breech Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use an awl to remove the exploded cape. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.



THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers dec23 tf

A VICTORIOUS INVENTION.

The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree or, when occasion required, covered with grass, leaves or other light material without in any way impairing its certain operation.

It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape.

It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

PRICE LIST:

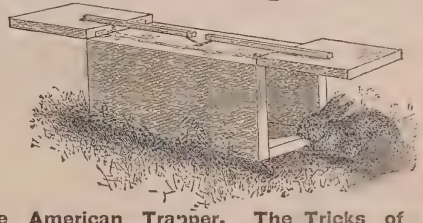
No. 1—For fishing and all kinds of small game and animals sent by mail..... 50 cents

No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, &c..... 75 cents

No 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, &c. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight 20 to 15 lbs. $10

All goods sent charges paid to any address on receipt of price. Adress

Chas. L. Coate,



480 Fulton St., Brooklyn, N. Y.

P. O. Box 214.

ADIRONDACK GUIDE.

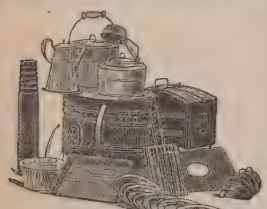
BY E. R. WALLACE.

Gives all possible information relative to Routes, Hotels, Resorts, Outfits, Guides, Distances, &c., with amended railway schedules, &c.

The Only Complete Guide to the North Woods.

The instructions embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—*Hon. J. T. Headley.*

I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.—*Benson J. Lossing.*



It is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for.—*Alfred B. Street,* Author of "Woods and Waters."

Sent by mail on receipt of price, $2.

H. L. DUNCKLEE'S
PATENT

CAMPING and MINING

STOVE.

PATENTED JUNE 22, 1875.

Outside dimensions, packed, 12x12x20 inches.

Weighing only 35 pounds, very durable, will cook for ten persons, and is especially adapted for camping purposes. The ware consists of 8 qt. kettle, 6 qt. tea kettle, 2 qt. coffee pot, fry pan, round tin pan, 2 square pans, dipper, gridiron, tent collar, 8 ft. funnel, and an oven that will roast 15 pounds beef.

The ware is so constructed that it nests and packs in the oven, and the oven and funnel pack inside the stove, as represented in cut 2, leaving room for packing half a dozen plates, knives, forks, spoons, and drinking cups. Price complete, $15.

Paints.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)
MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition

therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. CURLED OR WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE On

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

QUESTIONS FOR THE HIGHER PANTHEISM.

[To My Pointer Dog "Bob Lee" shot while participating in a sheep hunt, A. D., 1875.]

BACK to thine elemental forms
Resolved art thou;
Once dog, now, dust and air!
The ploughman's plough
Will win reward for thee in verdure fair.

Fast friend, true slave, companion—all
That dog could be,
I mourn—the partridge sings
Far down the lea
Beneath thee—grass—the changefulness of things.

Lo! while I write thy cry alone
Remote through space
Vibrates. They sole remain
The only trace
Left of thine entity, thy joy or pain;

Save in the vaults of memory,
Where lingers still
The shadow of the days,
By vale or hill,
Where joy met joy in sympathetic gaze.

What time the golden sunset fell,
On wood and stream,
While we, the loss or gain
Recount, and deem
The day all glorious with its rents and stain,

Hearing the distant partridge call
From field and fen,
While down the mountain side,
And o'er the glen,
The shadows gathered to the eventide.

Ah! life is not bounded by a name!
Nor centered all;
But stretcheth near and far—
Grief's joys appal,
Confounding us with gleams of what we are!

We strive to grasp and apprehend
The scattered sum;
From fact to inference
We go and come.
Yet fathom not our soul's circumference.

And so through time and space we live
A wide, weird life,
And know not what we be,
Till in the strife
We learn, through tears, life's strange plurality.

May it be, "Bob," that, after sleep
Beyond the river,
We'll hunt again the bevied quail
In Life's Forever,
Where come no sheep—where birds nor seasons fail? E.

For Forest and Stream.

Turtle Egging at the Gulf of Mexico.

AFTER putting the Idle Hour in good order by scraping and painting the hull, setting up the standing rigging, and shifting sheets and halliards end for end, so as to equalize the wear through all the parts, we were ready for the return voyage; but before turning our backs on South Florida it was decided that we ought to look in on some old friends living on Little Sarasota Bay. Beside the desire to see old friends, I own up to having a wish to eat a turtle egg custard and some egg fritters before leaving, and to do this I must first catch my turtle eggs. The turtle referred to are the large sea or logger-head variety, which lay their eggs in the sand just above high water mark all through the Gulf of Mexico, and on the Atlantic side as far north at least as the Carolinas. Our Northern visitors usually leave the State too early to know anything about them, as they do not lay very abundantly until the full moon of June and July. I have found the nest of an unusually early one in the month of March, but it was as far south as the northerly end of Charlotte Harbor. At the present time they had not commenced laying on the outside beach of Big Sarasota, but were reported to be "crawling" at the "Horse and Chaise." This is a tract of country between Sarasota Bay and Charlotte Harbor, where the main land comes quite down to the gulf and is not sheltered by an outlying range of islands. The country in back, being unsettled, is a great resort for game. I have made many inquiries as to how this particular name originated; but with little success. The best theory offered is that a group of pines, when viewed from the gulf some two miles out, bears a striking resemblance to that style of "turnout." I have cruised off-shore here, but have failed in seeing any resemblance between the pines and a horse and chaise, or any other means of locomotion, but then it is quite possible my imagination is not quite brilliant enough, and the person who did discover the likeness would have been just as likely to have said, "'Tis very like a whale."

This has always been a favorite place for turtles to "crawl," as they seem to know by instinct what part of the beach is unfrequented and where they are not likely to be disturbed. I have frequently seen where they have crawled in one another's tracks, and have dug in one another's nests in order to lay. Indeed, I once dug three nests within a space of six feet in diameter, which had all been laid during one night. To make this letter better understood I will go into the natural history of the animal a little. The adult turtle usually weighs from 250 pounds up to 700. The heaviest which I ever saw weighed, tipped the beam at 537 pounds. It is very strange, but no small logger-heads are ever seen. That is from the time they are hatched out, the size of a quarter of a dollar, none are ever caught until they are full-grown, near 200 pounds. I have made frequent inquiries among the green turtle fishermen, who are often annoyed by finding logger-heads in their nets, and they all unite in saying that they never find any under 150 pounds. Where are they all this time from infancy to adult age?

From examinations which I have made of those I have killed they usually lay three litters of eggs each season. A few times I have made out a fourth set of eggs. Each litter of eggs, if that is the correct term to call them, numbers from eight to twelve dozen, these are perfectly round, an inch and three-eighths in diameter, and covered with a soft, leather-like white shell almost as tough as parchment. The turtle digs a round hole in the sand with its hind flippers about ten inches in diameter and two feet deep. The whole number in the litterare deposited at one time in this hole, and are then covered over in such a way that the ground for a space of ten or fifteen feet in all directions is torn up, and one cannot tell by the looks of the place anywhere near where the nest itself is located. To ascertain its position we take a sharp-pointed stick, or, better still, an old-fashioned iron ramrod, and prod around all over the place that has been torn up. It is necessary to bear on very hard, for there is usually a foot or more of sand on the eggs, and the great weight of the turtle has compacted this very closely. When you come directly over the eggs the bottom drops out, and down goes your stick through eggs and sand, squash! Of course you spoil half a dozen eggs or more, but then what of that? you don't miss them among such a quantity. All that has to be done now is simply dig the sand away with your hands and throw out the eggs. If you calculate for a moment you will see that an enormous number of eggs must be laid on our coast in the course of a season, and one is led to wonder why the whole ocean is not solid with logger-head turtle. They are very numerous, it is true, but their enemies are on every hand. To begin with, as the turtle must be occupied for nearly half an hour on the beach in depositing its eggs, it is exposed to capture by man. But allowing that danger to have been safely passed, and the eggs stowed away snugly in their hole to await the action of the sun. All the animals of the forest, from the bear down to the wood rat, seem to know the egg season, and all flock to the beach. Especially the bear, coons and foxes seem to realize it, so that in some localities it is almost impossible for a man to find a nest that has not been robbed before daylight. These animals, too, don't have to probe about to find the nest, but seem to know just where it is and never make false points. Where coons and foxes are very plenty probably not one nest in a thousand escape their search, but there are some islands like Egmont, for instance, which have no animals on them; here the eggs may hatch. There are said to be some of the Tortugas Islands similarly situated, and when the eggs hatch the beach is literally alive with young turtles on their way to the water. The youngster is not safe there, however, for red-fish seem to know of the egg season quite as instinctively as the animals, and may be seen sweeping along in schools at the very edge of the water, picking them up as soon as they reach what is to be their element. If they run the gauntlet of the red-fish in safety that is the last we see of them until they are full-grown. The green turtle, although very frequently caught on this coast, very seldom lay here. I have never met with the nest of one. As I have said before, the logger-heads often get into nets set for green turtle, to the annoyance of the fishermen, for they are of no value. Although very fat their flesh is as tough as the poorest beef, and the fishermen cut their throats when they let them go adrift. It seems too bad to throw meat away in this manner, even if it is not first class, when there are thousands in our cities who are in want of even poorer food. If some plan could be devised for curing it any quantity could be secured and placed on the market, or even when alive they bear transportation almost as well as the green turtle.

But to return to the present trip. Mrs. Woodruff joined our party, and after an early breakfast we went on board the sloop, and with a light east wind headed for the pass. The channel is broad and plain between the islands for some two miles when the island on the north side ends. The channel keeps on in the same westerly direction for about half a mile, with a shoal on the north side and Big Sarasota Island on the south. It there crooks quite sharp to the south, running parallel with the beach, and about a quarter of a mile away from it for over a mile. The shoal keeps its position on the outside for the whole distance is often bare in places at low water, and even in perfectly calm weather the ground swell usually breaks along the whole length, so that with the exception of a small boat channel, close in to the north island, there is no place where it can be crossed, and that little channel is only practicable in smooth weather for boats of not over three feet draft. This leaves but the one channel for the pass, which occupys the position where we usually look for the south swash. The entrance is a full mile from the pass itself, and is fully seven feet of water on the shoalest part of the bar at low water.

The other entrance to Big Sarasota Bay is New Inlet, four miles north of the one just described, and here the entrance is also the south swash channel with five feet of water at low tide.

The east wind failed us before we were across the bar, but as the tide was running out we drifted across into deep water. The sea breeze kept us waiting for half or three-quarters of an hour, and then coming from the south-west by west we held on our course for the further point of land we could see.

About three miles from the entrance to Big Sarasota Pass, to the south, a point of rocks makes out into the gulf. These are the only rocks I know of along this beach from Anclote Keys to Charlotte's Harbor, and for that reason are a very useful landmark. Their composition is like concrete or the "coquina" which is found in the vicinity of St. Augustine, being composed of minute shells and sand joined in large masses. The ledge is some ten feet in height above low water mark, and as it extends on the bottom out into the gulf quite a distance forms a capital place for catching all kinds of bottom fish. Large black grouper constitute the majority taken, and I know of no better station for sport with a hand line from the shore than these rocks. On a favorable day more can be taken in half an hour than one will care to carry across the island, or to the boat, which will usually have to be left on the island side or at Little Sarasota Pass, which is about a mile further south. The rocks crop out occasionally on the beach until you come to the pass, and here is another large ledge, forming another excellent fishing station, and the north bank of the inlet. As Little Sarasota Pass is not over twenty-five yards wide one can pass it very easily without knowing it if half a mile or over from the beach. The rocks last referred to, being, as just noted, immediately on the north bank must be the landmark. Run south of them two hundred yards and a hundred yards from the beach; when they bear N. E. by N. steer for them until you are close enough to them to look into the pass, when you will readily see the channel. There is full five feet of water in the channel, which, as I have described, was out to the S. W. and parallel with the beach, but one can run across the bar with four feet anywhere in smooth weather. Owing to this shoalness it is not a safe inlet when the wind blows heavy on shore as the waves break all the way across. But once inside the character of the navigation changes wonderfully, as you find yourself in a moment in a perfect canal over two miles long, not over thirty yards wide and ten feet deep. The banks are almost perpendicular, and one's first impression would be that the canal was built by man so straight and regular is its formation. I account for it by the theory that many years ago the inlet was two miles south of its present location,

Heavy southerly winds have tended to blow the sand on its south side into the water, and the north bank would wash away. I know that eight years ago the inlet was over two hundred yards south of its present location, as at that time there were no rocks on its north bank, they were that distance up the beach. In no place is it over fifty yards across from the canal to the outer beach. Plenty of water in the canal everywhere until the bay itself opens, when as the water widens, some shoals are met with and the channel shifts from one side to the other a few times.

Just in front of the inland end of the canal a high shell ridge makes out from the mainland, and near its end, on the highest part, a Mr. Webb and family, from near Utica, N. Y., had put up their house at the same time I had settled on Big Sarasota over eight years ago. It was a perfect wilderness here at that time, not another settler on the bay, and none in any direction nearer than myself, five miles away. I was greatly interested to know how he had got along during the time, and as he was a thorough go ahead, working man, his place may be taken as a fair sample of what energy and perseverance can accomplish in South Florida. We landed, meeting a most cordial reception, as every one is sure to do at their hands. This is a favorite stopping place for several scientific gentlemen, and not a winter passes that they do not have two or three of them making observations on the fauna, etc., of the region. The younger members of the family, especially the young ladies are accomplished conchologists and ornithologists. One of them being, indeed, quite a sportsman, having killed a deer a few weeks before. They are by no means behind in the common female accomplishments, for we had some fine music on the parlor organ in the evening, as well as singing. Northern people seem to have an idea that those who emigrate South give up everything in the way of civilization or cultivation, but I must say, in this family they did not seem to run behind the world at all. They kept fully up with it, and home life was made as pleasant as in any Northern home.

Much to my regret Mr. W. and his eldest son were absent with their schooner on a trip to Key West, and I was obliged to take my walk through their clearing alone. I may have missed many objects of interest, but I saw more than enough of improvements to make me regret that Mrs. X. got homesick at Big Sarasota, for in the same length of time I might have progressed proportionately as far as they had done. They had cleared from the virgin hammock, it is true only some fifteen acres, but that was of the very best quality of land, and was cultivated with such good judgment, that no more was needed. His principal crop has been sugar-cane, but corn has been raised on the same ground, at the same time, with the same cultivation; for the corn crop is made before the cane gets over three feet high, and is gathered and out of the way by July. Sweet potatoes and other crops have not been neglected by any means. He has not gone very extensively into oranges, but has some two acres or more in bananas, and as these mature and bear fruit in less than two years from the time of planting one gets the most prompt return from them. He has an abundance of limes, guavas, alligator pears, sugar apples, grapes, and everything that can be raised to advantage. Indeed, he had a model place, if I am a judge, and I could not help feeling that I made a great mistake in not hanging on, homesick or not homesick.

In my walk I saw the evidences of the recent struggle Mr. Webb had been having with a fire which had been set by some "cow hunters," just back in the pine woods. His fencing had been burned, many of his fruit trees scorched, and the bananas also had suffered severely. This practice of burning off the woods every season is positively ruinous, for in the light soil of the piny woods it burns out all the decomposed vegetable matter which is there and leaves nothing but pure silex and ashes. It is true that if the roots of the grass are not killed the new shoots may spring up a little quicker, but the grass does not have that body later in the season which it would have if unburned.

While we were at tea a jaunty-looking yacht, of the Newport model, came into the bay and anchored just astern of the Idle Hour. When the small boat came ashore for some fresh water I found there was an acquaintance aboard, and as they had come down for green turtle eggs here was my chance for companions. Just after dark I rowed off to them in the skiff, but as the music and singing floated out to us from the parlor I had just left I fear we were in no hurry to get under way for "The Horse and Chaise."

When we had finally arranged everything, however, not forgetting a large supply of coffee and "hard tack," we found we had a gentle wind from the N. E. to waft us on our way. I won't undertake to describe the channel, it is so very intricate that unless you have a pilot you must puzzle it out for yourself. Oyster bars and sand flats are plenty, and only about two feet can be taken through to the head of the bay. Here are two passes, one usually called Caisey's Pass, and the other Bocha Chica. Very often both are closed, and when open, and in smooth weather, only three feet can be taken in or out. As we drew only some six inches we had no difficulty in running through the six or seven miles to Caisey's Pass, and disembarked a few hundred yards from the south point.

Just back from here several settlements were started a few years ago, and are doing nicely. There are many nice bunches of both hammock and pine land lying between Mr. Webb's and here that are still uncentered, and offer nice sites for homes to those who will get frozen out at the North this winter.

We reached the head of the bay about nine o'clock, and as it was rather early for turtle to crawl, and the tide but just turned in, we built a fire, made a pot of coffee to keep us awake, and took a little lunch.

About half-past ten or eleven (we tell time in this country at night by the "pointers" of the Great Bear), we divided our party. Mr. F. deciding that we had better set him across the pass, and he would walk the beach to the north, while Mr. W. and myself, being the light weights of the party, should walk to the southward. They both filled their pipes and took a good quiet smoke after the lunch, while I could only look on and regret that tobacco and myself could never agree. This is the only occasion when I have any regrets on that subject, but when I see a party sitting around a camp fire, all taking pulls at Vanity Fair, seemingly taking *so much* comfort and pleasure, I acknowledge I envy them and wish we were good friends.

Mr. F. set himself across the channel, and Mr. W. and myself started on our tramp. The moon was just peeping above the pines, the tide had been running in for two or three hours, and everything promised to be favorable for a good night's work. No wind and but a light ground swell, nothing to hinder the turtle from crawling in abundance, and so we found them, for before we were fairly out of range of the light of our camp fire we came upon the trail of one who had crawled out on the beach, and perhaps being alarmed by our light, had simply made what we call a "half moon" and gone back into the water. There is no difficulty in making out a turtle crawl, even on a dark night, as it is some three feet wide, and the sand is torn up much as it would be if a person had pulled a skiff along on land with a pair of sculls. Indeed, that is just what the turtle does, only it is a pair-oared craft, for his belly shell comes upon the sand nearly all the time, being only partially lifted at each stroke of his flippers.

We traveled on a few hundred yards, passing many old crawls, some perhaps of the night before, for in gathering eggs, where they are plenty, we are particular and take only the very freshest.

We walked just at the water's edge, and as will be evident, those crawls which show between the water and the last high water mark must have been made the present night, and these are the only ones we intend to examine for eggs. We soon came upon one, fresh and plain, leading up from the water's edge, and a few feet further on was his return path. He had gone back, so we should get no turtle here, but perhaps there were eggs. I had provided a stout pine splinter from an old skiff which had been wrecked near the pass, and we began probing in the sand just at the foot of a low, sandy bluff, some thirty or forty feet above high water mark. The sand, old drift, and grass was torn up all over a space some fifteen feet or more in diameter, and *somewhere* in this space was probably a nest of eggs, and that nest only about ten inches in diameter. It was not quite so bad as looking for a needle in a haystack, but yet it evidently required some patience and perseverence to probe it out unless we were favored by fortune and stumbled upon it among our first random probes. W. was a native of the Bahamas, and like all other "conchs," as they are called on the southwest coast, was an adept at turtle egging. He thought he could tell by the looks of the sand just where the turtle's head had rested when the eggs were deposited, and of course, that being known, and the head pointed some three feet away in the opposite direction should be the nest. I let him have the first trial with the probing rod. He made an observation upon his theory, and pitched upon a spot for the nest, but the probe wouldn't go down over six inches. He tried three or four times in the near vicinity, but no go. The bottom wouldn't drop out. I had seen others before this with a similar theory, and sometimes it does work, but the rule has so many exceptions that it is quite as well to trust to luck, or else, when that fails, adopt the slow and sure method of punching lines of probes clear across the space only three or four inches apart. Even this will sometimes fail, for an extra heavy turtle will press the sand down on the nest so compact that a common stick cannot be forced through it. An iron ramrod is much the best instrument, as it is very laborious work to probe with a wooden stick. W. took another observation, and decided upon another spot for the head to have lain. This also failed, and he probed around at random for a few minutes. Then I took a turn at it, and beginning near the centre, worked around in a circle with holes some three inches apart. I kept it up until a blister began forming in the palm of my hand, and then beginning to think the turtle had gone back to the water without laying, turned the probe over to W., who still insisted she surely laid. I looked on impatiently for a few minutes, all the time trying to get W. to give it up and seek an easier nest. But he still persisted and I started on slowly by myself thinking that would be the quickest way of getting him to leave. I was only well out of sight when I came upon a fresh trail leading from the water's edge. A moment's hasty glance showed there was no return trail. The turtle must yet be on shore up in the edge of the grass. I hastened in that direction, and sure enough there he was. We met face to face, for he had completed his task and was on the way back. I gave a shout to attract W.'s attention, but it must be the ground swell breaking on the beach drowned my voice, for he did not put in an appearance to assist me. Then commenced a lively struggle, for in spite of their clumsy appearance and ordinarily slow movements, in cases like this they develop surprising agility. With a noise between a snort and a puffy whistle, it made a rush to pass me. I did not care to stand directly in its way, nor to put myself within reach of its jaws, for these are so powerful that they can bite a piece out of a board. So as it passed me I jumped in, and, seizing hold under the edge of the upper shell, attempted with a sudden jerk to throw him over on his back. But I missed my reckoning. He weighed a good three hundred pounds, and both flippers on the opposite side were braced firmly against me, to say nothing of those on the same side with me flying about my arms and throwing sand in my eyes. He kept working towards the water, too, at a lively pace in spite of my efforts, and I began to fear I should lose him after all, when all at once it occurred to me there was a little knack about doing it like doing many other things. We had already got just to high water mark, the water itself only twelve feet away. Here the beach had a sharper pitch downward. Quickly shifting my hold further aft to a point immediately over the hind flipper I gave a sudden lift towards the front flipper on the opposite side, just at the moment when it had completed its stroke and was furtherest aft. By doing this it will be seen that at the moment I began to raise; he could bring neither flipper to bear against me. His head was the only obstacle in my way, and even that could not be brought directly against me. The slope of the ground assisted also, and although the sand flew about my face lively, over he went. But he wasn't safe yet, for although he could not turn himself over still he was below high water mark and the rising tide would soon reach him, when with its help he might float off and right himself. I hastened back to W., whom I met on the way. "What luck with the nest?" "None, but I'll bet my hat that turtle has laid them." "Too bad," condoled I, "but I have struck oil; I've got a 300-pounder out here who will be back in the water in ten minutes if we don't get him up the beach higher." We hurried back to my victim, who was still striking the sand wildly but ineffectually with his flippers, and after a hard pull, each of us taking a hind flipper, and working up one side at a time, we succeeded in moving him a safe distance above the water.

Going on further only a hundred yards we came upon two fresh crawls quite close together, both turtle had gone back to the water, however. We took a look at the nests, and as both seemed the genuine article we went on, for we had begun to surmise that we were a little late for catching the turtle themselves, and, beside, we thought it best to go to our furtherest point and dig eggs on our way home. They were safer in the ground than out of it, and there was no use in carrying them over the ground twice. At the sixth fresh crawl we came to; we surprised a pair of coons making their meal on *our* eggs. That little arrangement was broken in a hurry. The ground around was strewn with empty shells. We didn't have to probe here to find the nest, the coons had saved us that trouble; but they had paid themselves rather too liberally, for we counted thirty-eight shells from which they had sucked the contents. We began throwing out the remainder upon the sand; there were a hundred and thirteen. A pretty fair nest even after the toll had been taken, but probably an hour later there wouldn't have been one left. After they were dug the next question was what shall we do with them? It would never do to leave them here until our return; that would seem like digging them for the coons benefit; but how to carry them? Through some oversight the bags which had been brought for carrying the eggs had been left in the boat, and F. had gone across the channel to the north beach with them. After cogitating a few moments another old trick came to mind. I used to carry them in my trousers' legs in the good old time, why not now? Certainly, so off they came. Turning them wrong side outwards, so that when they were put on again the sand, etc., would be upon the outside. I tied the bottom of each leg up, and then filled about half the eggs into each leg. Now, by throwing my trousers over my shoulder, one leg in front and the other behind, I had a very handy kind of wallet, and could carry all the eggs from three or four nests with ease. It may seem rather rough treatment to the reader to give to eggs this carrying them in bags and trousers' legs, but the shell is as tough and looks almost like a white kid glove. The reader cannot be half as surprised at reckless handling as was a Georgia "cracker," to whom I once sold some at Cedar Keys. He was but recently from the "piny woods," and had never seen any before, but eggs were eggs to him, and hearing there were eggs at the wharf, at the low price of ten cents a dozen. He had nothing to carry them in so I loaned him a bag. He stood upon the wharf some five feet above me looking on as I counted them into the bag. When counted I gave the bag a throw into the air so that it would drop on the wharf at his feet. Such reckless handling of eggs he had never seen before, and he screamed right out with surprise at the danger he supposed his eggs were in. But not one was injured of course. He allowed they were queer eggs, and I allowed *to myself* he would think them still queerer if he eat any of them boiled, for I never saw any one like them the first time of eating. A liking for them must be acquired, as the yolk has a dry, sawdusty taste, while the white will never boil hard. They are great favorites with the "conche" and many others who dwell on the coast, but I don't fancy them cooked plain, but for making corn bread, custards and fritters they are capital.

On we went down the coast, having decided to go to the twelfth fresh crawl, then turn and dig the eggs on the way home. I don't think we went a mile from our camp-fire before the twelfth or perhaps the thirteenth was reached, and at this last a coon was already at work, but he had only just discovered the eggs as only five shells were lying

on the sand. We soon had the nest out, but it was a small nest, only two or three over a hundred all told. I found room for them in my "wallet," and we turned back to the next one. We found this by probing after a short search, and as there were over ten dozen W. took off his trousers and tied up the legs for a wallet. Fancy the figure we must have cut promenading up the beach by moonlight, with our trousers over our shoulders instead of where they ought to be. But then we felt sure of not being surprised by any of the fair sex in our dishabille, and luckily, too, for us, there were no mosquitoes, which was quite a contrast to the way it was the last time I was at the "Horse and Chaise." Then as I walked the beach, facing a stiff southwester, the mosquitoes would gather on the back of my neck, under the lee of my head, as it were, so thick that when I would strike around there my hands would come away covered with blood. Now, fortunately, there was not a single one about, but had they been as thick as some years ago *what* a time we should have had.

We did not meet a single turtle on our way back except the one I had turned. We were evidently too late, they were through crawling for that night. The exact time for them to crawl has not been reduced to a positive rule. Sometimes it is early in the night, and again late, but the majority, I sometimes think, crawl with the rising tide. Two of the crawls we had passed we were obliged to abandon; either the turtle had not laid or the sand was too hard for us to punch a hole through it. Another was robbed by the coons before we came back. Not a single egg was left unsucked. This was the nest of the turtle I had turned. We walked down to him to decide his fate. He was still flapping his flippers desperately in his helplessness. What should we do with him? The three of us would find a hard job to pull him to the boat with a rope the next morning. It would be quite as hard work to take him into a boat on the outer beach, for even in this still time the rollers were heavy. As to killing him where he lay, as is often done, that might pay, for we could carry the best pieces of meat and the fat away in buckets, but W. said they had not salt enough, he thought, to save it, and what little they had he wanted to save on the chance of their killing a deer while they were out. It wouldn't pay to kill him for his eggs as he had layed those which had matured, and the coons had got them, besides we had as many eggs almost as we cared to carry. Our trousers were pretty well filled, and W. was fearfully long-legged. This practice of killing the turtle simply for their eggs, I am sorry to say, is often resorted to. One is sure of getting fresh eggs, it is true. It was at last decided to let him lay where he was until morning, and then if Mr. F. had secured any one of us would come back and turn him over. Mrs. Webb had told me that some parties had been down there from Manatee, this season, and after turning turtles had gone off and left them to their fate. This outrageous cruelty cannot be too severely condemned; and how a man can abandon an animal to such a fate, in cold blood, is more than I can understand. It is bad enough to keep them on their backs when they are really wanted for use, but to leave them to die by inches in this way has less than no extenuating circumstances. A turtle would live in this way, exposed to the weather, often over a week.

On coming back to the first crawl we had met, where, it will be remembered, we had both probed in vain, we found the coons had been before us, and they had found the nest also. Just where we had prodded and probed our best, not far from the centre of the sign, they had found it. I presume their sense of smell must guide them, for I notice they never dig in but one place, and never dig at all unless the turtle has really laid. At this nest either we must have disturbed them while at their meal or else they had filled up at the nest where I had turned the turtle, for there was only about a dozen empty shells lying on the sand. We soon had the rest of them out. I think when I come to live in this country I will try and break a dog to scent out the eggs; but in the first place strichnine must be used among these coons, and liberally, too, for now there is nothing to kill them off. The coons that live near salt water, though often fat, are not usually eatable. A fish diet makes them too high-flavored, and as a consequence they are never hunted. The fur is too light to have any value in this low latitude.

Our trousers were well-filled by this last nest, for there were over ten dozen in it, and we were glad that it wasn't very far to the camp fire. As this had been blazing up brightly in the distance for some time past it told us that F. had returned from his search. We were soon with him, well tired with our loads and only too glad to find that he had been thoughtful enough to get the coffee ready against our arrival. We did not bother to count out what we had, but from the reckoning we had kept at the nests we had over a thousand eggs to turn into the bottom of the boat.

Mr. F. had met with excellent luck too. He had turned three large turtle, two of them before they had layed, and brought in two back loads of eggs. He did not think he could carry quite as many in the bag as we could in our trousers, as the bag was too square and could not be rigged wallet fashion, but he thought he had over eight hundred. He reported finding thirteen places where turtle had been killed and cut up on the beach this season, besides finding two which had been turned and abandoned as I have described. As they were still alive he turned them right side up, but it was some time before they could realize it sufficiently to know the way to the water. I forgot to mention that we passed several places in our walk where they had been slaughtered, but the north beach is the favorite for that, as the meat has to be carried only one or two hundred yards at most across the island to where the boat can come on the inside. After comparing notes it was decided to turn my turtle back into the sea, and also the one of F.'s which had layed, while the other two we would drag across the island alive and come up alongside of them with the boat. This would give them a turtle apiece to take home. I did not care for one, eggs were all I was after.

After drinking somewhere in the vicinity of a quart of strong coffee—and, by the way, it is perfectly astonishing what a quantity of strong coffee one can use who is in the open air in Florida and experience nothing but pleasant results—and eating two or three "hard tack," I felt so rested that I went back to my turtle and relieved him from the anxiety and uneasiness he must have experienced at his strange position. The poor fellow had thrown his eyes full of sand, but for all that he knew which way water was, and I could almost fancy I saw by the dim light of the moon a smile of gratitude pass across his countenance as he paddled off. I returned to the fire. It lacked only an hour or less of daylight, but I joined the others, who were taking a nap on the sand with a tussock of grass for a pillow.

We were stirring again before sunrise, and after another cup of coffee and "hard tack" went down to the boat. A hundred and fifty dozen eggs make a pretty good show, and we had that number surely. There is scarcely any limit to the quantity that can be procured, especially if some one will take the slight trouble to poison off the coons and foxes. A few pieces of poisoned fish scattered along the beach and on the nests would do the business for them, and there is no danger of the poison doing any harm to domestic animals.

There was little or no wind, so a "white ash breeze" was started, and we were soon opposite where F. thought the first turtle was, and landing found he was out of the way some two hundred yards. It didn't take long to rectify the mistake, and with rope made fast around him we managed after a good deal of struggling by all of us, turtle included, to get him safely stowed away and lashed belly up under the thwarts. F. said he would walk up the beach to the next one, and cross over and signal us so that we would hit the right place without bother, as he couldn't fix upon any landmark the night before. We pulled along slowly, stopping once on the way to gather and eat oysters at a bar we passed. Little Sarasota Bay abounds with oysters of the finest quality throughout its whole length, and in that period, "befo' the war," which has become almost as mythical as the "good old times," was the chief source of supply for Key West.

Our next turtle was a heavy fellow, a strong 450 pounds, while the other was only about 250, the ordinary size. Luckily the island was very narrow here, and there was no mangrove bushes to obstruct our progress, and adopting the same method of operations, with the addition of levers, he was tumbled on board and secured. Then we pulled our best for Mr. Webb's place, stopping once to load up with some extra large oysters from what used to be one of my favorite bars. Even this late in the season they were in excellent order, and I have always been able to find them good somewhere in this bay all through the warm weather. I took on board the idle Hour what eggs I could use, and so ended our turtle egging.

We returned to Big Sarasota the same evening, our only adventure being caught in a series of rain squalls, between each of which was a calm, just after we had crossed the bar and before we were inside. The tide ran out so strong that I was forced to anchor three times during the calms to avoid being carried on to the breakers.

MAJOR SARASOTA.

For Forest and Stream.

UP THE ANDROSCOGGIN.

FAR up among among the mountains skirting the banks of the Androscoggin river is a lovely little lake surrounded by lofty peaks of mountains and the rich primeval forest. The lake can only be reached by canoe, or a long, weary tramp of many miles through the woods by following the river, as it is far from railroad or highway.

On a cool, pleasant September morning, a party of four men, accompanied by two guides, might have been seen embarking in a large, flat-bottomed "batteau," such as lumbermen use on all our northern rivers, on the rapid waters of the Androscoggin. After a long day's work with paddle and pole, we came to our first camp, having shot on our way ten or twelve grouse treed by our little canine friend, Scot. On reaching camp and carrying our luggage on shore the guides began at once to prepare camp by pitching tent, getting wood, clearing away underbrush, etc. John, our head man; with Pete, his brother, kind and modest, make the best pair of guides to be found for miles. While standing on the margin of the shore admiring the beauty of the scenery, and watching the water tumble over a small ledge in front of the camp, just at a bend in the river, I hear Pete close behind me say, "Well, ain't you going to catch any fish for supper to-night?" "Why, to be sure I am," and away I go to unpack my light bamboo rod and flies, and try my luck.

On reaching the opening in the forest where our camp was to be made, I stood utterly dumbfounded at the change during the few moments of my absence. Here stood a snow-white tent with a roaring fire just before the entrance; over which was a pot of boiling potatoes, while the blue smoke curled up through the hemlocks into the clear twilight air above. Dip nets, rods and guns were leaning against the giant trees, and boxes, bags and other articles were strewn over the ground in the rear. The party had just completed their labors, and were enjoying a good smoke. Altogether it is as pretty a picture as one need see. Taking my rod and line I returned to the river and began to tempt the trout I knew were there in abundance. After trying two or three places I was at last rewarded by a strike, and soon a beautiful fellow was landed, and good luck favoring, a dozen were kicking in my basket in a short time, and on the way to the fire. Then followed a most delightful meal of fried trout, broiled partridge and boiled potatoes, with bread and maple syrup.

Shall I ever forget that first night in the woods so far from civilization? I trust not. Did you ever lie at full length before a good warm fire in the heart of the forest, with no sound to disturb you but the sighing of the wind through the tops of the tall trees, and the merry voice of "many waters" hurrying onward to the ocean? And as you reposed thus have you seen the silvery light from the rising moon touch each little ripple on the surging river, and light up each little leaf of the tree above? I could just make out the outline of my rod against the trees, and remembering I had a long day's work before me, and the others having one by one fallen asleep, I also slumbered till daylight unmolested, when we awoke fresh and happy.

Breakfast was soon cleared away, tent struck, and baggage on board, and bidding adieu to our camp, we began our onward journey. The guides poled the boat over the swift water, while the rest walked with the dogs along the margin of the stream. We bagged many grouse on that long walk—enough to last us two or three days. At length we reached our next camping place, situated at a bend in the river not many miles from Lake Umbagog, at the foot of a mountain, and near the beautiful little lake before mentioned. Here we spent the balance of the afternoon fishing, and meeting with but poor sport were glad when John's loud whistle announced supper as ready. We missed the trout, but were fully contented as we sat round the fire on boxes and logs, with broiled partridge, potatoes and roast green corn, which we borrowed in a farmer's field as we came along.

Next morning, after tying the dogs in camp, we trudged through the woods to the lake, arriving just after sunrise, and were soon on some rudely constructed rafts, and all trying to catch the first trout, for which a dollar had been offered. Mr. C. soon had him, and bore off the prize. Now the sport began in earnest, and in an hour we had some noble fish. Our friend George B. hooked a monster, but lost him after a long struggle, during which we all suspended operations to watch the sport. The breeze dying out and the rays of the sun getting unendurable we adjourned to the woods, ate our lunch, and enjoyed a good smoke. Again we tried the trout, but with no success, the water being too warm and still to make them feel like rising to the fly. While on the raft quietly fishing Mr. C. saw a bear walking leisurely along the margin of the lake, but as our guns were all on shore, the old fellow was perfectly safe.

We spent two days at this lovely spot, obtaining all the sport we wanted, killing plenty of grouse, wild pigeons and wood ducks, though the fishing was not prime; still, we thoroughly enjoyed every minute, and were sorry when the order to pack up for good was given. We had a most delightful trip down stream, and at some places rather exciting sport, as we dashed over the rapids, the water being so low that it was with great difficulty that we were kept from being dashed on the rocks. We were only an afternoon traversing the distance it had taken two whole days to come. We reached our starting point tired and hungry, and "turned in" immediately after a good supper at the hotel. Next night found us at home, and though I've been in the woods often since then, and have had far better luck, I always look back with pleasure to my first camping trip on the beautiful Androscoggin.

CANOE.

CLASSIFICATION OF CLOUDS.—Whenever, on account of some topographic circumstances, the sun heats any locality on the surface of the earth more than the surrounding region, a gentle current or column of heated air rises, and its invisible moisture is condensed into small masses of cloud called cumuli, which spread and produce the mottled appearance commonly known as "mackerel sky."

But when, as it is frequently the case in summer, a valley or plain, or island, or any other place, is much more highly heated than the surrounding region, the heated air over such locality rises more rapidly and with more ascensional momentum; and, as it reaches the higher and cooler regions of the atmosphere, its moisture is condensed into large rounded volumes or mountain-like masses of cumulus clouds. Such cumulus clouds always precede and characterize a local summer storm or shower. When the warm horizontal current from the south, as in winter, meets with the cold current from the north, it slopes upward over the cooler current and forms stripes or bands of stratus clouds along the horizon.

These stratus clouds indicate to the observer that a warm current is coming northward. When in summer a cool current is moving southward, it encounters the warm equatorial or tropical current, which again glides upward and over it and forms horizontal bands of stratus clouds along the upper line of contact, as in winter storms; but, in addition, the denser cold air from the north, moving with momentum, will lift up the warm and saturated air from the tropics and its moisture will be condensed into masses of cumulus clouds banked up against the top of the cold current and arranged over the horizontal stratus clouds. Thus is produced the combination of cumulo stratus cloud, which is characteristic of progressive summer storms.

To the tornado cloud produced in a whirl of air and resembling an inverted cone, Professor Blasius gives the name of conus, which is both descriptive and appropriate.

These four typical classes of clouds, viz., cumulus, stratus, cumulo-stratus and conus, indicate and characterize the four different classes of storms.—*Blasius's Theory of Storms.*

Fish Culture.

ABSTRACT OF THE ELEVENTH ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF CONNECTICUT.

THE Fish Commissioners after mentioning the work done by the United States Commissioners and the Convention at Philadelphia last week, allude to the efforts they have made to impress upon the people of the State the value of their ponds and streams, and have made great efforts to collect information regarding them. The result is given in a tabulated list of the ponds showing the average of each, and regarding which a further Report will be made as soon as the great mass of information regarding them which they have obtained can be revised and corrected. From this list it seems that there are 256 ponds in the State, varying in extent from five acres to two thousand, and aggregating an area of 31,604 acres, containing a variety and number of fishes, although not a thousandth part of what they might be made to produce. Besides these ponds there are a greater number of ponds of less than five acres in extent.

The Commissioners dwell at length upon the availability of all these ponds to be converted into food producing preserves, and also as regards the ownership of the same and the right to fish therein. They say the popular idea has been that fishing was free to all, and the assertion of any exclusive right on the part of the owner of a pond has been looked upon as a species of feudal arrogance, justifying resistance and open defiance. The sense of justice and right inherent in the people, when the matter is made clear to them, is relied upon to make them respect private rights, and it is thought that the fear of depredators will no longer prevent pond owners from stocking their waters.

The introduction of black bass and land locked salmon has occupied the attention of the Commissioners, and it is hoped that they will be able to procure the European Carp and other varieties of fish. Pursuant to the laws passed last year, notices were issued to all parties engaged in fishing, and in reply, calls for blanks were received from two hundred persons. To these, blanks were issued to be filled by the parties at the end of the season with the numbers and kinds of fish caught from day to day. Of the blanks so issued only one hundred and thirty-nine returns were made, of which fifty-seven were of pounds, forty-nine of seines, and thirty-three of gill nets.

48 pounds caught	134 059 Shad.
43 seines caught	71,643 "
33 gill nets caught	48,262 "
Total shad caught	254,564
43 pounds caught	12,831,682 Whitefish
2 drag nets	2,043,055 "
Total whitefish caught	14,874,737

These pounds and nets also caught 414 bass, 25,376 flat fish, 476 black fish, 7,070 alewives, flounders, porgies, mackerel, sea robins, sturgeon, and various other fish, making a total of 33,336 different fish.

Notwithstanding that these returns are necessarily incomplete, they show the value of the business and the willingness of the great body of the fishermen to comply with the law, particularly on the part of the pound fishermen. The Commissioners have been expected in cases of violations of the close seasons and other infringements of the laws, to take upon themselves the parts of Grand Jurors or other State Attornies, functions which do not come within the scope of their duties, and which it would be impracticable for them to perform with all their other labors. They suggest that the towns shall appoint their own wardens to be approved by them, and that those intrusted in fish culture shall boldly sustain the wardens in the enforcing of the laws.

The State was allotted a quota of 500,000 California salmon eggs, of which it was found when they were raised, October 2d, 1876, that 10,000 had died. More died during the hatching, leaving a total for distribution of 477,286 healthy fry. These were distributed as follows: In the Farmington river, 300,000; in the Housatonic, 100,000; in the Natchang, 50,000; in the Saugatuck, 27,286.

Many *parr* and *smolts* have been caught in the Farmington and Connecticut during the past year. They were in such excellent condition as to prove that up to this point of growth Connecticut waters are just as well adapted to their nature and needs as they were in the days of their abundance. The Commissioners have specimens of these young salmon from six to eight inches long, beautifully marked, and showing every indication that they had enjoyed abundance of nutritious food. These and other facts show that now there is no reasonable ground of doubt that the rivers have not been rendered unfit for these fish. So far, then, the problem has a favorable solution, and it only remains to patiently wait to see if these young fish will not in due time find their way to the sea and return again. During the past summer evidence was brought to the Commissioners that many of these fish were caught that were really on their way to the sea; some of them were seen and handled by one of the Commissioners, and by other persons, and that they were young salmon, no one who saw them had a doubt. On the 24th of June (1876) a fine, healthy salmon, weighing 18½ pounds, was taken in a gill-net at Middle Haddaur. On July 6th, a salmon weighing 11 pounds, and in excellent condition, was caught in a pond off Clinton. Vague reports have been received of others being taken, and enough has been shown to make it certain that the work of restoring salmon to the rivers of the State has progressed so far, that before long all doubts will be solved.

An interesting letter is given from Mr. Charles G. Atkins, at Grand Lake Stream, giving an account of his work in procuring the ova of the land-locked salmon for the joint account of the United States Commission and the Commissioners of various New England States. Last year, at the time the Commissioners' Report was made, there were 150,000 young land-locked salmon in the Westport hatching house ready for distribution, and they were distributed when the Report was being printed. It was subsequently ascertained that one pond in the list was purposely omitted, as its waters were found unsuitable for the fish. This pond was Mount Tom Lake, in Litchfield. In all other respects the list was correct. The number distributed was 135,000, in thirteen bodies of water. The proportion of eggs of these salmon now at Grand Lake Stream, which will fall to the share of Connecticut, cannot yet be determined.

With regard to shad, it is well known that the only breeding ground on the Connecticut where shad have been hatched with success is at Holyoke, in Massachusetts. The control of this place is under the Commissioners of Massachusetts, who with great courtesy have always granted a permit to the Connecticut Commissioners to fish for spawners, and collect ova, at a season when the citizens of the State were forbidden by law to draw a net. For two or three years the United States Commissioner has co-operated with Connecticut in this important work, and the river has afforded stock for other rivers, while enough has been reserved for all the purposes of Connecticut. Last year, however, the privilege was secured to the United States Commissioner, and the whole work was devolved upon him and his assistants. Success was very limited from the fact that the excessive heat which lasted from about June 20th until July 25th, raised the temperature of the water to 88° and even 90° Fahrenheit. The drouth at the same time was such that the water was very low, and the instinct of the fish doubtless taught them that they could not live and propagate in such warm water. The experiment of Seth Green showed that when the temperature of the water exceeded 82° Fahrenheit, the eggs all died. Among the few females taken last year, it was noticed in some cases that the eggs were all spoiled in the mother before extrusion. It is probable that the great majority of the fish spawned further down the river than usual, in the shallows bordering upon deeper and cooler water. This is not a very common occurrence; the old fishermen say that it happens once in a great while, and during such a season, the fishing at Holyoke is a failure.

CARP IN AMERICA.—A Vermont correspondent requests us to protest against the introduction of Carp into the waters of this country, and refers to it as a "coarse, flabby fish." Were our correspondent well informed respecting all that has been done by those at the head of Scientific Fish Culture and propagation in this country and Germany, toward introducing certain species of Carp into American waters; and were he also willing to take the testimony of these gentlemen as to the toothsome and edible qualities of certain varieties of the Carp, he would rather rejoice than demur. Some of the family, we are aware, are worthless as food, but others are superior; and the great point gained by their introduction here is, that they will thrive in waters where other kinds of fish will not, thus adding to the general food supply. There are localities whose inhabitants would rather have a poor quality of Carp than no fish at all. Some Carp afford good sport to the angler, as well as food for the table.

SALMO SALAR IN LAND-LOCKED WATERS.—The following correspondence will interest our Fish Culturists:—

EDITOR FOREST AND STREAM:—

Your correspondent Jas. B. Thompson, of New Hope, Pa., whose article on *Salmo salar* in land-locked waters appeared in February 15th number of FOREST AND STREAM, would confer a great favor upon his brethren interested in fish culture, if he would give through your columns a detailed description of the construction of his ponds. What is the nature of the bottom; what the volume and character of the water supply; the disposition or arrangement of his spawning grounds by which it is designed to keep up the supply, and all the information, which, as an expert he is competent to furnish to the uninformed in this particular undertaking?

With the ice eighteen inches thick on the Susquehanna river at this point at this time, I can't quite see into his description of his salmon "breaking lively for the past few days," but perhaps he is able to explain what at present seems beyond mortal ken. Will he do us the favor to elucidate?

A. F. CLAPP.

Sunbury, Penn., Feb. 19th, 1877.

NEW HOPE, Pa., March 1st, 1877.

EDITOR FOREST AND STREAM:—

At your request, I will endeavor to enlighten your friend, A. F. Clapp, on what seems to him beyond mortal ken. All our fish ponds are situated at the head of a lime stone spring, flowing (3,682) three thousand six hundred and eighty-two gallons per minute, with an even temperature, never below 50° Fahrenheit. We have no ice on our ponds, and no surface water. If salmon break, as they did this day, they are not obliged to go through fifteen inches of ice. The bottom of the salmon pond is shell, with small springs and several well-worn channels of stone and gravel, and one three hundred feet long, leading from the lake to the spring, with a beautiful bottom for spawning, hatching-house and stock ponds.

As usual, to please the owners, our first salmon eggs were from Samuel Willmot, which did well; the second lot from him—saved none. Three lots from Bucksport, one year did well, next year saved a part; last year thirty-five thousand—all died by bursting of the sack in fifteen days after hatching. I used all the means in my power to save them, and I cannot tell whether the decease (*sic*) was in the egg or not. California eggs have always hatched well, and the fish live. Hatched seventy-five thousand this year; twenty-two thousand yet in hatching-house four months old, two and one-quarter inches long; fed twice a day. Any one seeing them eat would not advise their being turned out to die as soon as the sack is absorbed. It is not much trouble to buy trout or salmon eggs—hatch and dispose of them the first month—but a very different thing to keep them alive for six months.

JAS. B. THOMPSON.

CANADIAN SALMON RIVERS TO LEASE.—Anglers will please refer to the advertisement in our columns of Canadian salmon rivers to lease.

GRAVE CONUNDRUM BY A CONSUMPTIVE.—What is the difference between an Ulster and the consumption? One you wear *out*, the other wears *you* out!

Natural History.

For Forest and Stream.

ANTLERED DOES.

SAN FRANCISCO, February 12th, 1877.

In a score numbering somewhat over four hundred head of deer, I have been so fortunate as to shoot two of these very rare animals. The first was shot early in November. It was of medium size, in fair condition, and had never borne young. Her antlers were of unequal length; the right one being about six inches in length, and the left four. They were three-fourths of an inch in diameter at the base, and tapered to a fine point, but grew in such a dwarfed and spiral manner as to rise barely two inches above the skull. The second was killed February 8th, and was one of the largest ever killed by the writer; was in splendid condition, had borne young, and was with young when shot. Her right antlers was seven inches in length, almost perfectly straight, very smooth and white, one inch in diameter at the butt, and with a perfectly true taper to a delicate point. The left was four inches long and much curved, directly backwards; although this was about six weeks later than the time at which bucks usually shed their antlers, they showed no signs of falling off, but a forcible detachment from the skull, and a careful examination, satisfied me that they would have been shed in the course of the winter.

Lest the lateness of season at which this doe was killed should subject me to censure, I wish to state in justification, that this was in 1853, when the deers were so plenty in many places as to seriously interfere with the raising of peas and beans, and in many instances even the potatoes were dug up and devoured by them. The protection of deer in Maine had not then been thought of. I also know of two does being shot by fellow hunters, each with only one antler, and I think my old friend and hunting companion, who has lain down the rifle to manufacture "probably the best" spit bamboo rod in the country, and who, as a deer hunter, had few equals and no superiors, can add to the list from his own experience. Let us hear from you, Hiram!

And now, by your courtesy, I wish to put on record the shooting of what I believe to be the most remarkable deer ever killed in this country. It was on the 11th of November, 1851 (the year in which I began my diary, which I have kept up to date). Eight inches of "beautiful snow" had fallen early on the evening of the 10th. Snatching a hasty breakfast as daylight was fast appearing, and shouldering my rifle (my *first* one in its *first* season), I started for an opening made two years before, half a mile south of ours, and which was full of maple and yellow birch sprouts, on which the deer had been browsing nights for a fortnight. I had scarcely entered the field when I struck a track, half filled in by the snow which had fallen subsequently. Following it up, I found that the deer had been browsing in the field through the storm, and had left about the time it discontinued. At nine o'clock the evening previous the animals had gone due east, in which direction lay first a cedar and tamarac swamp, half a mile wide; then about the same width of small, thick spruce growth, called in Maine "Rabbit salad," and then a noble ridge, three miles in length, running north and south, with a growth of heavy sugar maple and yellow birch, with an occasional hemlock of immense size. It was noted throughout the region for its lack of underbrush, affording in many places open shots at two hundred yards distance. Towards this ridge the game slowly made its way, with many devious windings, clipping the delicate twigs of the fragrant yellow birch, or daintily picking a certain kind of tree moss, of which the animal is extravagantly fond. The track had every appearance of being made by a buck, and this quiet browsing occasioned me some surprise, as this was in the height of the "running season," when they only eat enough to prevent starvation, and invariably lie down after browsing a short time, being always almost too much exhausted to stand before they will stop to eat. I, therefore, traveled at a snails pace, expecting every moment to see the animal start up, or at least to come to his soft bed in the snow, with the first tracks fifteen feet from it. Nothing of the kind however occurred, and I at length reached the foot of the ridge, up the side of which the tracks lead, as far as I could see them, directly towards its summit. A minutes' careful scrutiny satisfied me that my game was not in sight, and I had already lifted a foot to proceed when my eye caught sight of a moving object, directly ahead; the next instant the head, ears and antlers of a noble buck, burst on my delighted vision, as he walked over the summit directly towards me. "Ah!" (I thought) "this is a doe's track after all!" The buck has "struck it, and is following it the wrong way!" (as they will often do, sometimes for half a mile or more before finding out their mistake). He was over one hundred and fifty yards off, and all I had to do was to remain motionless till he got near enough to assure a fatal shot. The head and antlers steadily advanced, glancing in and out from behind intervening trees, and I began to wonder why I did not see his body, but it was merely a passing thought till at length the head appeared in a perfectly open glade, with nothing between me and it, and behind the pure, white back ground of the new-fallen snow. A head, ears and antlers, about three feet above the ground, and absolutely nothing else! The apparition had about the same effect on me as that of the fabled Madusa, when displayed by the hero to the tyrant and his court. I stood as if turned to stone! At that distance I could have easily seen a squirrel on the snow, and failing to distinguish the body of a full-grown buck, one must be blind indeed. Reared in the woods from infancy, with a reasonably sound mind, in a perfect healthy body, I refused to believe in the reality of what I saw, or rather failed to see. My outward senses appeared suspended, or perhaps concentrated in the single one of sight, but my thoughts struggled for a solution of the mystery, and seized on the only possible one that presented itself. I had sat up the previous night till long after the snow was over, watching the sky for fear it would hail and spoil my sport; had gone to bed with my head filled with the thought of the morrow's hunt, and the whole was but a vivid dream. So strongly was this impressed on my mind as the true salvation, that I felt the same overwhelming desire to awaken that a person does when under the influence of a horrid nightmare. Then arose on my memory all the details of the morning; of my building the fire; of my good mother's willingness to get up and cook

my early breakfast without a word of reproach, and her parting injunction to "be sure and not shoot yourself." No, I was surely awake and had probably gone mad, or at least was in a fair way to become so. By this time the object had got within fifty yards of me. My eyes, which had not for a single second swerved from the contemplation of it, now caught sight of a movement directly under it. I glanced downward and distinctly saw two black hoofs alternately rise and fall in and out of the snow. Like a flash of lightning the mystery stood revealed. The animal was white! white as the driven snow which formed the background, as the hill rose behind him, and my concentrated gaze fixed on his head (which with his ears were of the normal color) had failed to discern his body. The revulsion of feeling was so instantaneous that I was transformed at once from a statue to something very much resembling a wet rag. The perspiration rolled down my face; my limbs almost refused to support my weight, and my trembling hands failed to lift the rifle from where it lay across the hollow of my left arm.

If the animal had remained in my sight it is doubtful if I could have recovered myself it time to have shot at him, but almost directly in front of me, and not twenty feet away, stood a gigantic hemlock three feet in diameter. A sudden turn in the track he was following brought him directly behind it. The instant he disappeared from view the fear of losing him overcame every other feeling. I saw that the track led across the roots of the tree and turned immediately behind it, consequently he would not come in sight till he got to the tree, and if he scented me and bounded suddenly to the right or left, or ran back in range of the tree, I should in all probability in my then excited state lose him altogether.

Steadying my nerves by a powerful effort of will I cocked my rifle and slowly swung it into position; an instant of breathless suspense and the head appeared from behind the tree, so near that I could actually see his eyelashes! At that instant my finger pressed the trigger, and the beautiful animal bounded into the air and fell literally at my feet; at the same instant, scarcely conscious of what I was about, I dropped my rifle into the snow and sprung on to him only to receive a tremendous kick from his hind feet in his dying struggles, which doubled me up like a jack-knife, and for fifteen minutes white deer had no charms for me. Recovering my breath I wended my way home and returned with a "Tobogers," on which I dragged him home in triumph, where he was the wonder of the whole neighboahood. Nothing except snow itself could equal the whiteness of his coat, on which was not a single colored hair to within four inches of his ears where the line was as distinctly and evenly drawn around his neck as if carefully painted with a brush. Some idea of its whiteness can be gathered from the fact that a rabbit in his pure winter's coat was procured, and on being placed beside the skin its hair actually exhibited a yellowish tinge. But far more wonderful than all else was the enormous quantity of fat with which this animal was covered It wholly surpasses belief, and were it not susceptible of the most convincing proof I should not dare to state it. He was completely covered with a layer of pure white fat from half an inch to *four inches* in thickness, the greatest thickness being for a short distance on each side of the spine just forward of the tail. As this statement will be universally discredited among old hunters I have only to say that a piece was cut from this part and placed on a shelf in an outhouse where it remained frozen from November till March, and was seen by more than a hundred persons, and the writer can bring a score of witnesses to corroborate his statement, his aged mother among the rest, who, although in her eighty-first year, still remembers it as distinctly as the narrator.

I should have stated that when I returned for my game I followed the track over the summit of the ridge and found it was the same one I was pursuing. He had lain down just beyond where I first caught sight of him, and was doubtless retracing his steps with the intention of getting back to his feeding ground again at dark. His condition and actions proved beyond doubt that he was incapable of that erratic fury which possesses his normal mates at this season of the year; although he appeared to be a perfect animal in all respects, with a beautifully symmetrical pair of antlers; but being very young at that time, and destitute all anatomical knowledge, my opinion as to his powers of reproduction was of no value. I can only hope that the account of his capture will be of sufficient interest to excuse its length. PENOBSCOT.

LONG ISLAND HISTORICAL SOCIETY.—Chas. Hallock, Esq., recently presented this society with an interesting collection of relics and curiosities which he had picked up in the course of his travels during the past twenty years. Among them were:—

Snow shoes and moccasins from Manitoba.
A drum and snow shoes from the Nascaupie or Mountaineer Indians of interior Labrador.
An Esquimaux comb and seal skin tobacco pouch from Labrador.
A large alligator's skull and egg.
An Indian pipe from Lake Superior.
A Sioux tobacco pouch elaborately worked with beads.
Skull taken from a shell mound in Florida.
A Seminole Indian bow, from the Florida Everglades.
A Commanche scalp with both ears on.
A Chinese umbrella.

By invitation Mr. Hallock addressed an audience of about 200 ladies and gentlemen, giving a brief but interesting history of some of the articles presented, and a sketch of the people and places where they were obtained.

A THREE-THOUSAND POUND FISH.—There was on exhibition at Newburyport, Massachusetts, a short time since, a rasp-fish (*Mastodonte*), so-called because its skin is tough like a rasp, which weighed three thousand pounds. It was taken by Captain Woodman, of the schooner Greyhound, near the Isle of shoals, after a hard tussle of six hours, in the course of which much damage was done to boats, rigging, and vessel. The liver filled three barrels. The stomach contained a codfish that weighed twenty-five pounds, quantities of haddock and other fish, and a whole dog that weighed twenty five pounds. The local paper says "the fishermen don't know what to call it, as they have never seen anything like it before." It is evidently a shark, though to what species or even genius it is to be referred we cannot tell, as no description whatever is given. Perhaps it may have attracted the notice of some of our correspondents, who can give us some definite information concerning the monster.

P. S.—Since writing, our wide-awake correspondent "Teal," of Salem, Mass., informs us that some of the curators of the Peabody Academy of Science have named it a "Nurse Shark"; said creature is about 15 feet long, of a dull leaden color, having a skin very like a "dog-fish," but coarser and rougher. It was taken wound up in a haddock trawl. They are a deep sea creature, said to be rare about the New England coast, and a curiosity to see."

AN ADIRONDACK PANTHER.—Verplanck Colvin, Esq., who is engaged in the prosecution of his topographical survey of the Adirondacks, shot a panther a fortnight ago, southwest of the Raquette Lake region, which measured seven feet in length and weighed 200 pounds. It was engaged in feasting on a deer's carcase when discovered, and the remains of several other deer were discovered in his vicinity. Mr. Colvin will present this specimen to the State.

—Mr. G. T. Barker, of the Camp Lounge Company, has very kindly presented us with the occiput of an antlered doe, properly mounted for hanging up in our editorial sanctum, which we are very happy to receive and shall take pleasure in showing to our friends. It was obtained of Mr. Jacoby, a frontiersman of the Muskoka district of Canada, residing at Severn Bridge, who killed the horny-headed doe in Lake Koshesheboga mog. It bears a close resemblance to the description of a similar and quite uncommon deformity of the deer recently given by several writers in the FOREST AND STREAM.

Mr. Barker reports that the last year has been a good one for the Camp Lounge business, and says: "We take pleasure in adding our testimony to that of your other patrons as to the eminent value of your journal as an advertising medium."

CATCHING SEALS WITH FISH-HOOKS.—Our frequent correspondent, "Teal," of Massachusetts, writes: "I lately saw a seal which was caught by a hook in its mouth, said hook being one of several used on a "trawl." The singular fact to be noticed is, that this seal should have bitten at the bait and been caught. They are taken in trawls by getting foul, but fishermen say it is rare to find one that gets caught by the mouth."

—A South Boston correspondent, "Sawbones," says that he has twice seen antlered does of *C. Virginianus*. He inquires whether these masculine females are as fertile as other does.

A RARE DUCK.—A correspondent sends us from Syracuse, N. Y., the following newspaper clipping which will be of great interest to ornithologists:—

"A few days since, while gunning along the Onondaga Creek, between this city and the lake, Master Fred. Howlett, son of Alfred A. Howlett, Esq., had the good luck to bag a very rare specimen of the duck family, known as the "King" duck, *Fuligula spectabilis*. The specimen, being an exceedingly fine male bird, was turned over to Mr. T. Bex, taxidermist, who has set it up for Mr. Howlett, and for a few days it can be seen in the show window of Messrs. S. P. Pierce & Co., on Salina street. The fowl is a native of the northern regions, and rarely advances southward of 45 degrees of latitude."

Our correspondent says:—"As the paper states, it is a King Duck, *Fuligula spectabilis*. Thinking it might be of interest to you that one had strayed so far south, I inclose the clipping." X. Y. Z.

Not only that it had strayed so far south, but that it traveled so far inland. Ornithologists will please add this species to the "Rare Birds of Western New York."—ED.

THE MOHAWK RIVER BASS.—"Dexter," of Albany, writes:—"In answer to your correspondent, "Glens Falls," would say I have never noticed the Mohawk bass as regards the double curve of lateral fin, but will do so next season. The lake bass all seem to have it."

SCIENTIFIC PUBLICATIONS.—Numbers 7 and 8 of Vol. 8 Bulletin of the Essex Institute are at hand and contain much that is interesting and instructive. Number 7 relates to the Field Meeting for August and the report gives brief addresses made by the members on this occasion. Chiefly noticeable are the remarks of Vice President F. W. Putnam on a human skull from Colorado, which closely resembles the ordinary form of the Algonquin Indians, such as are found in the Indian burial places in Massachusetts; and those of Prof. Morse on *Drosera*, and on the manner in which the grasshoppers make the peculiar chirping noises and the notes they utter. Rev. James Freeman Clarke gave a brief address touching on some points in philology which was of much interest.

Number 8 is devoted chiefly to reports of business meetings, but contains also a list, by Mr. J. A. Allen, of Birds collected by Mr. Chas. Linden, near Santarem, Brazil. This list includes 128 species, of which one, *Coccygus lindeni*, Allen, is now described for the first time.

From *Nature* we learn that Prof. Desor, a recent member of the *Bulletin de la Societe des Science Naturelles*, at Neuchatel gives a description of a burial place recently discovered on the shores of Lake Neuchatel near Auvernier. The remains of fifteen or twenty individuals were found in this grave but in such a poor state of preservation that but few good skulls could be obtained. Some of the better preserved, however, show a close resemblance to those found in other lake dwellings and belong to the true Helvetic form differing from the latter not in kind, but only in degree. The implements found in the grave are of stone and bone, and belong to the age of polished stone. With these, however, were also found some bronze implements which established the long missing link between the lake dwellings of the stone age and those of the bronze age, both of which have representatives at Auvernier. The importance of the Auvernier grave is thus very great, as it gives new proof in support of the alleged unity and continuity of races of prehistoric man during the stone age and that of the bronze. Some bronze implements implying a somewhat higher degree of culture together with a bead of yellow amber and a skull, were found in the neighborhood of the grave on a somewhat higher level; they belong probably to a more recent period. It is proposed by the Neuchatel Society to undertake further excavations in the same locality.

SKY LARKS.

NEW YORK PRESS CLUB,
No. 6 Centre street, New York.

EDITOR FOREST AND STREAM:—

A few years ago attempts were made to introduce the English sky lark (*Alauda arvensis*) into this country, and several pairs were let loose on Long Island, which I believe, nested. But they soon disappeared. Later it was reported that sky larks had been seen in Westchester county, but lately nothing has been said concerning them, showing, apparently that the former report was an error, or else that all have been killed. It is recorded that sky larks have been seen in the Bermudas and in Greenland.

I should be very glad to ascertain any further or more definite facts from your readers with reference to this matter, (particularly as to dates, and the probability of any sky larks now being in existence in this vicinity) either through your columns or by addressing me personally.

ERNEST INGERSOLL.

BASKING AND BONE SHARKS.

NEW BEDFORD, Mass., Feb. 21st, 1877.

EDITOR FOREST AND STREAM:—

In your last number, a writer in some remarks on the "Basking" and "Great Bone Sharks," seems to confound two or three distinct species and even genera. The "Basking" Shark of the New England coast, and Bone Shark of the Pacific, are of entirely distinct species. Some very good notes and also references to scientific authorities may be found in the number for January 25th, 1877, of *Nature*.

CONCHA.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS, MAR. 3D.—One red-shouldered hawk (*Buteo lineatus*), presented by Sergt. James Spear of the Park Guard; one Virginia deer (*Cervus virginianus*), presented by F. G. Thorn, Phila.; one great horned owl (*Bubo virginianus*), one red-shouldered hawk (*Buteo lineatus*) and one red-tailed hawk (*B. borealis*), presented by Emanuel Spitz, Philadelphia; one *Pseudemys concinna*, presented by Theo. L. Harrison, Phila.; three opossums (*Didelphys virginiana*), one presented by J. W. Sharp, Jr., Keeseville, Pa., one by E. S. Power, Phila., and one by Jesse L. Johnson, Eddington, Pa.; two white rats (*Mus rattus*), presented by Miss Jones Phila.; one golden eagle (*Aquila chrysætus*), presented by Andrew Bateman, Dover, Del.; four English rabbits (*Lepus cuniculus*), two presented by Edward K. McKwan, Phila., and two by Mast Ed. Hacker, Germantown; one ring dove (*Turtur risorius*), presented by Miss Tryon, Phila.; one red fox (*Vulpes fulvous*), presented by George Green, Phila.; one quail (*Ortyx virginianus*), presented by Edward S. Miles, Phila.; one pair white rats and young (*Mus rattus*), presented by James B. Thomas, Phila.; one sparrow hawk (*Falco sparrerius*), presented by Master Henry Sargent, Phila.; two white rats (*Mus rattus*), presented; three Canadian lynxes (*Lynx canadensis*), three *Menobranchus maculatus*, and one turkey buzzard (*Cathartes aura*), purchased.

ARTHUR E. BROWN, Gen. Supt.

Woodland, Farm and Garden.

O Proserpina!
For the flowers now, that frightened thou let'st fall,
From Dis's wagon! daffodils,
That come before the swallow dares, and take
The winds of March with beauty; Violets dim,
But sweeter than the lids of Juno's eyes.
Or Cythera's breath; pale primroses,
That die unmarried, ere they can behold
Bright Phœbus in his strength, a malady
Most incident to maids; bold oxlips, and
The crown imperial; lilies of all kinds
The flower de luce being one! O, these I lack,
To make you garlands of; and my sweet friend,
To strew him o'er and o'er
Flo. What! like a corse?
Per. No, like a bank, for love to lie and play on;
Not like a corse; or if—not to be buried
But quick, and in mine arms. Come, take your flowers;
Methinks I play as I have seen them do
In Whitsun's pastorals; sure, this robe of mine
Does change my disposition,
Flo. What you do
Still betters what is done. When you speak, sweet,
I'd have you do it ever; when you sing
I'd have you buy and sell so, so give alms,
Pray so, and for the ordering your affairs,
To sing them too. When you do dance I wish you
A wave o'er the sea, that you might ever do
Nothing but that; More still, still so, and own
No other function. Each your doing
So singular in each particular,
Crowns what you are doing in the present deeds,
That all you ur acts are queens.—*Cymbeline*, Iv. 3.

THE FUCHSIA.—When we consider the facility with which Fuchsias can be grown, and also the extreme beauty and profusion of their flowers, the wonder need not be so much why they are so common, as that more attention is not bestowed upon growing them into fine and attractive specimens. It is true plants are to be met with now and then which are all that could be desired in this respect, but taken in the aggregate, whether as seen in the establishments of florists, or in the conservatories of the wealthy, they are all too often the most abject and neglected things imaginable upon which time and money have been bestowed. This should not be; neither is it creditable to the enterprise and intelligence of the age, seeing that it is one of advancement in all matters appertaining to horticultural pursuits, as well as other branches of human knowledge and skill. The time cannot come too soon, therefore, when those whose business it is to cultivate plants, either for profit or for pleasure, shall of necessity reach a higher standard of excellence in specimen growing than that

which now so generally prevails. This applies more especially to gardeners, and the highest reach of perfection ought always to be the objective point of their ambition. To reach this point two or three facts must be well understood, founded as they are upon the nature and requirements of the plant, and by acting upon these success will follow as a natural and necessary consequence. These are a suitable compost in which to grow the plants; a temperature regulated so as to be in accordance with their natural requirements, and the condition of the soil and atmosphere in reference to moisture.

Experience teaches that this plant delights in a fresh loam, thoroughly enriched with well-rotted manure and a little charcoal, broken from about the size of beans to fine dust. Even the fine siftings of coal ashes can be used to advantage; more especially if the compost is very rich, as it restrains any tendency the plants might have to make long-pointed shoots, and encourages instead a rigid symmetrical growth, which is most to be depended upon for an abundant bloom.

Charcoal and coal ashes increase the porosity of the soil, and thereby enlarge its capacity for the absorption of those gases which go to build up the vegetable structure. But we dare not affirm that such substances in the soil can be taken up by the roots of plants and assimilated without chemical or other change; and yet, the curious discovery announced by Prof. P. B. Wilson, of Baltimore, seems to favor such an assumption. "The experiment consisted in fertilizing a field of wheat with the infusorial earth found near Richmond, Virginia. This earth, it is well known, consists of microscopic marine insects (plants?) known as diatoms, which under strong magnifying power reveal many beautiful forms that have been resolved, classified and named. After the wheat was grown, Prof. W. treated the straw with nitric acid, subjected the remains to microscopic test, and found them the same kinds of shells or diatoms that were present in the Richmond earth, except that the large-sized shells were absent, showing that only silica particles below a certain degree of fineness can ascend the sap pores of plants."

In nature, plants of whatever description attain their greatest perfection in a climate the warmth of which is most agreeable to their individual temperaments; and this fact, simple as it is, should never be lost sight of by those who have to deal with exotics, as it will enable them so to shape their conduct as to meet the drawbacks of climate, and other adverse circumstances in such a way as to overcome them.

Fuchsias can be grown in a moderately warm house, provided fresh air can be freely admitted, but they do better through the winter months in a temperature not exceeding fifty degrees, and when much higher than this they are apt to grow weak and spindling. They are not well adapted for out-door culture in this climate, as it is so warm and dry as to expose them to all the ills living plants are subject to. At the same time, when planted on the north side of houses, fences, or in other shaded places, they grow to a measurable degree of perfection.

But to insure absolute and unvarying success, strict attention to watering is indispensable, whether in the house or out of doors, in pots, or planted out. And it will be observed, the compost herein recommended for pot culture is of such a character mechanically as to insure the most ready exit of all superfluous water—a point of the utmost importance in pot culture. The rule is to water with caution through the dull days of winter, increasing the supply as the season advances, and at no time to allow the plants to show signs of wilting. Sprinkling overhead, too, has its advantages, especially in clear weather, and should be the oftener done as the plants reach their maximum of growth, and continued throughout the season unless in dull, wet weather. If considered desirable at any time to encourage a still more vigorous growth, it can readily be done by watering with liquid manure, such as can be got from a barrel containing barn-yard manure and water; or, instead of manure, as much guano as will slightly color the water Much time can be saved in watering by painting the outside of the glass with a paint made of white lead and turpentine, in the proportion of about one pound of lead to one quart of turpentine; and this also will protect the foliage from being hurt by the direct rays of the sun, an event not unlikely to happen any time after the middle or end of March.

In following these directions the plants will not be subject to the attacks of other enemies than green fly, and to keep clear of these fill the house about once in ten days with tobacco smoke and the work is done.

Subjoined is a list of several varieties worthy of a place in every collection: Double dark corolla, *Prince Leopold*, *Elm City*, *Regalia* and *Faust*. Double white corolla Montrose, *Symbol*, *Empress* and *Enchantress*. Single dark corolla, *D. T. Fish*, *Monarch*, *Inimitable*, *Beauty's Boom* and *Prince Imperial*. Single white corolla, *Mrs. Marshall*, *Rose of Denmark*, *Puritane*, *Schiller*, *Mrs. Bennett*, *Lustre* and *Speciosa*.

New Haven, Conn. A. VEITCH.

CHLOROGALUM POMEVIDICANUM KUNTH.—This is an interesting plant of the easist management. It forms large tunecated bulbs, invested with a mass of black, hair-like fibres, which are said to be used for stuffing mattresses, and the bulbs themselves are so alkaline and mucilaginous, that the plant is popularly known as the Soap Plant, and is not unfrequently used for detergent purposes. The leaves are broadly linelar, with wavy margins; amid them rises a slender scape, two to three feet high, with several spreading branches bearing numerous white flowers. Seeds vegetate very readily, and the bulbs grow freely when sufficient space is afforded them, but several years usually elapse before they attain a flowering size. It is a native of California.

S. B.—*London, England.*—Can you tell me the name of the enclosed plant? I understand that it is very common in Canada and the northern United States, and that it has the flowers which open in the autumn.

ANS. *Gentiana Saponari, L.*—This Gentian is rather common in moist woods in New Jersey and Pennsylvania, flowering late in the fall, and resembling in general appearance the *G. Pneumonanthe*, of Europe. The most beautiful of the genus in this country is the fringed Gentian (*G. crinita Froel*), growing in low grounds and common, we believe as far west as Wisconsin. The lovely alpine Gentian (*G. verna*), so commonly cultivated in England, and so scare here, is another beautiful example of the genus.—ED.

ORIGIN OF REMARKABLE BELGIAN PEARS.—The Abbe Hardenpont of Mons, was the first of the race of Belgian fruit growers. In the last quarter of the last century, he obtained from seed the Beurre de Hardenpont, the Passe-Colmar, the Beurre Rance, and the Delices d'Hardenpont, some of which still hold places of the first rank in advanced Pomology. M. Van Mons, of Louvain, quickly followed, having between 1787 and 1854, raised five hundred kinds of new Pears, several of which are of the highest class. M. Beront, between 1845 and 1854, produced within that decade no less than sixty new kinds; in 1828, he produced le Delice d'Flays, which is even finer than les Delice d'Hardenpont. The Society Van Mons, only produced eleven new Pears during the sixteen years of its existence, showing that individual perseverance is very generally more successful than combined efforts. M. Gathoge, of Liege, produced in 1852, Beurre Edouard Morren. In 1828, M. Magner; obtained from seed the Poire Renoz, a good and fertile summer kind; and M. Henrard, as early as 1840, introduced his Bon Chretien and Vernois, said to have been received from France. M. Legepont, of the Commune of Charneux, produced in 1800, the celebrated Fondante d'Charneux. The Bon Chretien Lamarche, was found in a convent garden of the province of Leige, where its origin was unknown.—*From "Les Fruits Belges," by M. Gilbert.*

THE VIOLET AND THE NAPOLEONS.—The 15th November is the Empress Eugénie's fête day, and Violets become perceptibly dearer in Paris on that day during the Second Empire, when there was a perfect Violet ovation; bunches of Violets, not in hundreds, nor in thousands, but in tens of thousands, being thrown through the iron railings of the court-yard of the Tuileries. The palace servants piled them up into enormous pyramids, which reached as high as the first floor windows; the various doors were decked with them, and the great central balcony.

MOSSES AND LICHENS.—Weak creatures! the first mercy of the earth, veiling with hushed softness its dintless rocks! creatures full of pity, covering with strange and tender honor the scarred disgrace of ruin—laying quiet finger on the trembling stones, to teach them rest! No words that I know of will say what these mosses are; none are delicate enough; none perfect enough; none rich enough! How is one to tell of the rounded bosses of furred and beaming green—the starred divisions of rubied bloom, fine-filmed, as if the rock-spirits could spin porphyry as we do glass—the traceries of intricate silver, and fringes of amber, lustrous, arborscent, burnished through every fibre into fitful brightness and glossy traverses of silken changes; yet all subdued and pensive, and framed for simplest, sweetest offices of grace! They will not be gathered like flowers, for chaplet or love-token; but of these the wild bird will make its nest, and the wearied child his pillow.

And, as the earth's first mercy, so they are its last gift to us. When all other service is vain, from plant and tree, the soft mosses and gray lichen take up their watch by the headstone. The woods, the blossoms, the gift-bearing grasses, have done all their parts for a time, but these do service for ever. Trees for the builder's yard, flowers for the bride's chamber, corn for the granary—moss, for the grave!

Yet, as in one sense, the humblest, in another they are most honored of earth-children. Unfading as motionless, the worm frets them not, and the autumn wastes not. Strong in lovliness, they neither blanch in heat nor pine in frost. To them slow-fingered, constant-hearted, is entrusted the weaving the dark, eternal tapestries of the hills; to them, slow-penciled, iris-dressed, the tender framing of their endless imagery. Sharing the stillness of the unimpassioned rock, they share also its endurance; and while the winds of departing spring scatter the white hawthorn blossom; like drifted snow, and summer dims on the parched meadow the drooping of its cowslip-gold—far above, among the mountains, the silver lichen spots, rest, star-like, on the storm, and the gathering orange-stain upon the edge of yonder western peak reflects the sunsets of a thousand years.—*Ruskin.*

THE LONDON "WORLD" ON SALADS.—Of the infinite variety of salads which can be made from wild plants—the Salad Burnet, the Ladies' Smock, the Stonecrop, the Sea Bindweed, the Sweet Cicely, the Buckshorn Plantain, and the Ox-eye Daisy—our people know next to nothing, and allow quantities of excellent food to be wasted on cattle. The Dandelion, which is a favorite salad in France, and a herb renowned for its virtue, we should be half ashamed to see on our tables. Nothing will do for us but the most highly cultivated kinds. First of all there is the Lettuce, which is of two sorts—the Cabbage Lettuce, known in France as the Laitue pommée, and the Cos Lettuce, which the French term the Laitue romaine. Of course—and there are endless varieties of either—we seem in England to prefer the latter with its long leaves, because it can be eaten by itself, while the French probably care more for the former. Then comes the Endive, in three classes—first, the broad-leaved or Batavia Endive, which the French call Scariole—a prime favorite; next the Curly-leaved Endive, which the French call sometimes Chicorée and sometimes Laitue frisee; lastly, the wild Endive or Succory (Succory being but the old English word for Chicory), which is called by the French Barbe de Capucin. Perhaps next in order of rank deserves to be mentioned the Celery—but we only use the bare stalk, whereas the French put the whole plant into the salad bowl, from the root at one end to the leafage at the other. Even better is the Celeriac—that is a Celery with Turnip-like root. The Celeri-rave of the French and the Knott-sellerie of the Germans. The latter are especially fond of it, and go into ecstasies when they talk of it. In England although it may be cultivated with greater ease and at less expense than the common Celery, it is slighted, though, served up with a dish of Red Cabbage, it is particularly alluring. Then there is the Tomato salad; but for that matter Tomatoes are pleasiful enough, and ought to be in everybody's reach. The wonder is how anyone who knows what a superb thing is a salad of raw Tomatoes can care to desecrate this glorious Apple by cooking it. But I should weary the reader if I went on to sound the praises of the Corn salad, the Beet-root salad, the Potato salad, the Salade de legumes; and of the minute accessories—the Tarragon, the Chervil, the spring Onions—which when cunningly applied give a gaiety and sparkle to the composition. It is necessary to conclude, and I conclude with the remark that there are salads in abundance, and with a little trouble we can have them in perfection.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

WATER VELOCIPEDES.—M. Jobert exhibited a new river velocipede at the Maritime Exposition held last year in the Palais de l' Industrie, Paris. It was composed of two cigar-shaped floats made of tinned plate, united by a platform of very light wood, which carried the seat of the operator. To the platform the mechanism was also attached; and it consisted of a paddle-wheel, with two cranks on the axle, with straps for the feet. The action is exactly that of a terrestrial velocipede, and therefore requires no further explanation.

To steer the velocipede, a light rudder is placed in the rear of the apparatus, and it is handled by cords passing round a pulley turned by the handle in the hand of the operator. M. Jobert claims that a very high speed can be obtained.

THE NEW ROWING GEAR.—Mr. Lyman having procured new tools and machinery is now making his Bow Facing Rowing Gear in a most perfect manner and warrants it to out last any other description of oar. See the advertisement.

EMPIRE YACHT CLUB.—At an election of officers of the Empire Yacht Club, held at their club house, foot of 104th street, East River, on the evening of the 1st inst., the following were chosen for the ensuing year:—Commodore, Wm. O. Davis; Vice Commodore, Daniel O'Brien; Rear Commodore, Thomas S. Morrell; President, Nathaniel Lockwood; Treasurer, Jas. Gorten; Secretary, Jas. McClymont; Measurer, Andrew J. Brush; Board of Trustees, Daniel Quinn, Alonzo Gibson, George Farrington; John Farrell, Peter Esterbrook; Regatta Committee, Edward S. Zoble, Theodore W. Reeves, Simeon Gorton, Edward McDonald, Charles E. Mielke. There are twenty-seven yachts enrolled in the squadron—1 steam, 7 cabin and 19 open boats.

—John R. Stewart, Robert T. Holly, Fayette C. Walker, Arthur L. Jackson, John F. Outwater, Robert H. Hopkins, Howard Ackerman and James H. Champlin, have filed a certificate of incorporation in the County Clerks Office of the Varuna Boat Club, of Brooklyn, for "boating, athletic and social sport."

NEW ENGLAND YACHTING NOTES—THE OUTLOOK FOR 1877.

FROM OUR EASTERN CORRESPONDENT.

BOSTON, March 1st, 1877.

EDITOR FOREST AND STREAM:—

Although the weather the past two or three days has been anything but favorable for the pleasant pastime of which I am about to treat (it takes more than slush and rain to deter a yachtsman from his travels), the builders generally are busy, and new interest is being gradually awakened.

The most noted of our builders that are busy, are Messrs. Hutchins & Pryor, R. Bibber, Pierce Brothers, and George Lawley & Son.

One very noted feature of interest is the hollowing of spars. From hollow masts we go to hollow bowsprits, booms, gaffs, top-masts, top-sail poles and clubs, Messrs. Lawley being particularly busy in this line. The sloops Kelpie and Rebie are being entirely refitted. Messrs. Lawley have also several orders to build center-board sloops about twenty-six feet long.

Messrs. Hutchins & Pryor are finishing an extra nice Newport-rigged boat, twenty-two feet long, for Albert Stone, Esq. Critics pronounce her the finest piece of work on the point

Messrs. Pierce Bros. have just finished a $1,000 Newport-rig, twenty-four feet long boat, for C. A. Spring, Esq. She goes to Annesquam, Cape Ann. They have also commenced a second order—about nineteen feet. From the excellent reputation of the builders, we predict speed and comfort.

Mr. Bibber is building tenders, and is finishing very nicely; the sloop Wayward, of New York notoriety, receives two of them.

Mr. Woods, of East Boston, is building a forty five feet schooner yacht for a Mr. Tudor. Mr. J. Pierce, of same place, has just got out an idea in the shape of a square-ended boat, twenty-six feet long, drawing six inches of water; she has a center-board almost the whole length of her.

Our yachts this side of Cape Cod are generally small, but we take just as much (and I don't know but more) pleasure as in the larger ones. Some of them are very fast, and we are conceited enough to want to try with some of your New York flyers. We are not much given to wander from home, and we wish you could persuade some of your folks to come this way; they would meet with a warm welcome, and would find the nicest *yachtman's home* in the *shape* of a *Club house* in the country. Come and see us. Yours, KEDGE.

BUNKER HILL YACHT CLUB.—The regular monthly meeting of the Bunker Hill Yacht Club took place at Charlestown, Mass., Wednesday evening of last week. After the regular business was attended to, the members, with invited guests, consisting of Commodore Palmer and members of the East Boston Yacht Club, sat down to an excellent chowder prepared by Caterer James O. Neal, and to which every one done justice. After the wants of the inner man were supplied, Commodore Brown, of the B. H. Y. C., was called upon for a speech, and responded in a very able manner. He then introduced to the members Commodore Palmer, of the East Boston Yacht Club, who pleasantly referred to the prosperous condition of the several yacht clubs of Eastern Massachusetts, and of the friendly feeling existing among them.

BOSTON YACHT CLUB.—An adjourned meeting of this club was held on Wednesday, 28th ult., at 8 o'clock, p. m., at the office of the Treasurer, Augustus Russ, Esq., 15 Pemberton Square, Boston, Commodore Authur Cheney in the chair. Mr. Benjamin Dean reported on behalf of the Trustees that they had audited the accounts of the Treasurer, and found them correct. The permanent fund now amounts to $10,495 46. The expenses of the past year were $1,661, and the regular receipts $2,300. They recommend the passage of a resolve that hereafter only one quarter, instead of one-half of the receipts should be added to the permanent fund. The resolve was adopted. The Trustees were also authorized to use the permanent fund to liquidate the mortgage on the Club House. Commodore Dean stated that the total amount of club property now was $14,042. Messrs. John Bryant and Daniel Sargent were elected members of the Club.

GREENWOOD LAKE.—In accordance with an invitation extended by the Greenwood Lake Sportsman's Club, a number of representatives of the Rowing Association of American Colleges visited the lake on Saturday last. The party comprised Jasper T. Goodwin, Captain of the Columbia College Boat Club, accompanied by Messrs. Boyd, President of the Club, and Sage, Colgate and Pryor; Mr. Clarke, Captain of the Princeton College Boat Club; Mr. Thompson, of Cornell College, with Albert H. Vernam, of the Greenwood Lake Sportsmen's Club, Lindsay Watson, of the Nassaus, and a few other gentlemen. But few of the College oarsmen had ever visited the lake, and were thus able to convince themselves of its adaptability. They were most favorably impressed, and although nothing was decided on the spot, there is every reason to believe that the inter-collegiate races will be rowed there.

Since last summer about seven feet of water have been drawn off the lakes for the purpose of removing a large number of old stumps of cedar trees which appeared above water. All these are now cleared away, so that the oarsmen in future regattas may have their choice of two courses. The lake is still covered with ice sufficiently strong to admit of travel on it. The collegians availed themselves of this means of getting to the point where the grand stand was erected last year for the amateur regatta.

There are strong probabilities too that Rutgers College and the University of Pennsylvania will be represented in the next inter-collegiate regatta, and it is not unlikely that one or two of the southern colleges will also put in crews. The advantage of reducing the crews from six to four men affords an opportunity to the smaller colleges to enter the list.

THE BEAVERWYCKS.—It having been rumored that this boating Club was about to "Peter out," the Albany *Times* is authorized to say that this impression is wrong; that no one has any intention of retiring from the Club, but that it is about decided to wind up the organization the coming spring. There is no internal dissention in the Club.

—The Columbia Boat Club of Brooklyn held their annual meeting on Friday, March 2d, 1877. The report of the several officers were in every way satisfactory to the members. The Treasurer reported *cash assets* of $413.30; liabilities *nil*. Besides this the Club own their boat-house, situated on Gowanus Bay, and have the following Club property: One eight-oared barge, one four oared barge, one six oared gig, two four-oared gigs, one pair oar shell, our double scull shell, one single scull shell, one single scull wherry.

The Coxswain's report showed the total number of miles rowed during the season of '76 to be 5,857, the first ten on the roll being C. W. Lippett, 653 miles; S. B. Hazard, 953 miles; H. H. Leland, 375 miles; P. E. Robinson, 336 miles; E. Oakey, 315 miles; George Barnes, 293 miles; J. S. Stokes, 270 miles; J. F. Boyd, 258 miles; H. T. Dunham, 241 miles; William Chapman, 239 miles. The Club numbers thirty-three active and nine honorary members; of these thirty-five rowed more or less during the year.

The following named gentlemen were elected officers for the current year: James Foster, Jr., President; William J. Bruff, Vice President; Austin Ludlum, Secretary; P. E. Robinson, Treasurer; H. H. Leland, Captain; George Barnes, Lieutenant; H. A. Harrison, Coxswain Mess; Charles L. Sanderson, William G. Clapp, W. S. Ballow, Charles S. Butler and J. F. Nichols, Trustees.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

PAT, New Albany, Miss.—Who owns Pride of the Border and Fairy? Ans. Chas H. Raymond, Esq., Morris Plains, N. J.

JUSTIN, Poughkeepsie.—You can obtain an excellent map of the Eastern Shore of Maryland and the Peninsula by addressing Bowman & Thomas, Wilmington, Del.

A. L., Newton, Mass.—Do you know of a breeder and breaker of dogs by the name of C. W. Coots formerly of Havana, N. Y.? If so, what is his reputation as a breaker, and what is his present address? Ans. We do not know him.

H. E. S., Manchester, N. H.—Where can I purchase some wild rice and what will it cost per bushel? Ans. You can buy it from Richard Valentine, Janesville, Wis. We do not know the price.

W. R., Derham, Mich.—Can you inform me where I can procure gun caps like one enclosed, and the cost? Ans. The cap is unknown to any of our dealers, and must be of foreign make.

S M., Titusville, Fla.—Can you tell me where I can get the army pattern sewed brogans? Ans. From Pitkin, Waterbury & Co., No. 110 Chambers street, this city.

J. A. B, Boston.—Do you know when Mr. Gildersleeve's Old Tip flourished, and is her pedigree known? Ans. Old Tip was whelped in the spring of 1843. On page 244 of our volume Five you will find a full history of the breed, and on page 325, Volume Three, there is a list of his descendants.

L. H. Jr., Philadelphia.—Can you inform me where I can go to find first-class snipe shooting (English) this and next month, and near Philadelphia? Ans. Go to Epping's, six miles from Egg Harbor; good place but rough living and shooting.

H. H.—Please give your opinion of the Eagle Claw for catching fish and mink. Ans. Our principal objection to it would be on the ground of its liability to mutilate the skins of animals caught with it, but it is certainly a simple and effective trap.

L. B., Hibernia, Fla.—Can you give me the address of some responsible party who will dress and prepare in any desired way, any skins which may be sent to him, and who will do the same for a reasonable price? Ans. Address Mr. Favor, 10th avenue, between 67th and 68th streets.

SUBSCRIBER, Auburn, N. Y.—1. What is the proper load for a 12 gauge, 9 pound breech loader, for duck shooting? Please mention also size of shot and brand of powder. 2. Do E. & G. Hackett, of London, make a good gun? Ans. 4 drs. powder and 1⅛ oz. No. 4 shot, the former of a size corresponding with Hazard's Ducking No. 4. 2. Yes.

F. W. M., Summit, N. Y.—Will you be kind enough to send me, if you have it on hand, pamphlet issued by the Grand Rapids and Indiana Railroad? What is your opinion of the Eagle Claw for trapping, etc.? Ans. Pamphlet sent. The Eagle Claw is a sure trap, but we apprehend would mutilate the skin somewhat.

C. H. M., Atwoodville, Conn.—1. What is the cheapest food for a number of dogs during the summer? 2. About what would it cost per month to feed a common sized setter dog on Spratt's patent dog cakes? Ans. 1. Cornmeal mush boiled with meat scraps. 2. Allowing him 1½ pounds per day it would cost about $4.50

D. B. M., Corry, Pa.—Is there such a thing as Damascus barrels, where the figure stands out on the barrels so as to make them rough? Should they not be smooth like twist or other barrels? Ans. We have seen fine Damascus barrels on which the pattern could easily be felt with the hand. These barrels were on a very fine gun.

R. E. P., Ferrisburgh, Vt.—A friend has very kindly helped us to answer your query of Jan. 18th as to who "Nesmue" was, and under his tutelage are able to say that "Nesmue" once wrote for Porter's *Spirit of the Times*. His name is George W. Seare—lives at Wellsboro, Tioga Co., Pa.—a shoemaker by trade, and a thorough-bred sportsman; has written for Porter's *Spirit*, *Adams*, Putnam's, &c., &c.

H. W. P., Philadelphia.—What can I do for my cat. He has lost all the hair from around the neck over the head, and it has been replaced by a short crop of grey hair; his other was black, and he has a dry scab that comes on the ears and around the eyes; his appetite is very good, but he does nothing but sleep? Ans. Presuming that the general health of the cat is good we should give him a little sulphur in his milk and anoint the spots where the hair is off with carbolic salve.

J. T. W., Albany.—I notice in your issue of last week, in the notice of Colburn's Dash, that you name Putnam's Nell as the mother of Putnam's Dan, and as in the pedigree of my Dash, Palmer's Belle, imp., is given as his mother, I call your attention to the matter so that if my pedigree is wrong I may correct, or if your's is in fault you may do the same. Ans. Putnam's Nell was the mother of Dan, and we have corrected your pedigree to correspond.

H. J. L., Meadville.—Is there a paper published in this State that devotes itself to shooting? Ans. The *Germantown Telegraph* has a sportsman's department. There is no paper exclusively devoted to sport.

G. C. P., Harrison, N. Y.—Where can I obtain a camping tent, large enough for four or five persons, and about what would be the cost of the same? Ans. You can obtain such a tent as you want from J. W. Frazier, No. 23 and 25 Dey street, this city. The cost will be $22.50.

F. B. R., Orange Co., Fla.—Can you tell us of any sure method of ridding ourselves of the gopher tribe? Owing to their habits they are extremely difficult to study. Ans. Traps buried at the entrance of their burrows and the use of poison are the means adopted in gopher countries for destroying some of these animals, but it would require the combined efforts of a large community of trappers to effectually exterminate a small community of well established gophers, which "means business."

J. M. H., Philadelphia.—Can you inform me what fish I should be likely to find in Lake Champlain? also where I could procure a map of the lake? Ans. Pike-perch, pickerel and black bass are the most common fish. In some parts of the lake the black bass fishing is most excellent. Fish Commissioners have put some salmon trout into the lake from time to time during the past few years. Cotton & Camp, publishers, 172 William street, New York, will sell you a map of Vermont or New York, including Lake Champlain.

D. V. S., Warren, Pa.—There is a party of gentlemen here that have some five dozen quail that we intend putting out in the spring, but they are some of them lousy, and are dying off. They have plenty of feed, dirt, ashes, and are in a good, comfortable place that is dry and warm. If you can suggest something that will stop this difficulty you will greatly oblige us. Ans. Dust the birds thoroughly with sulphur through the feathers; or with Persian insect powder, and keep everything clean.

W. M., Baltimore.—1. Is the route to the Indian river the same in summer as in winter? I have some doubt about it on account of the low state of the rivers. 2. Would it be unhealthy there about June? I have to go there on business. Ans. There is outside communication between Jacksonville, St. Augustine and New Smyrna, on Indian river at all times. When the river is low the transmit via the St. John and Salt Lake is impracticable. It is as healthy there as at any place on the coast.

T. T. M., New York.—1. What kind of ducks will I find in Shinnecock if I should go during the right time? 2. Could I shoot ducks and geese at same time? 3. Will a 7 pound gun be heavy enough, or would you advise me to procure another one? 4. Where can I hire a gun and at what cost for two days? Ans. 1. Widgeons, spoonbills, black duck, red heads, etc. 2. There might be a flight of geese at the same time, but you would want to be properly rigged for them. 3. A 7-pound gun would be too light for anything but an occasional single duck. 4. We do not know.

FAVORITA.—How can I rid my canary of lice? Ans. The cage must be thoroughly cleaned and scoured, the bird must then be taken and his feathers filled with a German insect powder, that comes for the purpose, and every day afterwards, at evening, a white cloth should be put on the cage, taken off and shaken out the window or over the fire before you go to bed, replaced, removed, and shaken again before dayling in the morning. This is to be followed up closely until not a louse is left. If your bird has not moulted well, is dumpish and does not sing, he is without doubt lousy.

J. J., Milwaukee.—Please inform me what rifles were used by the Jamaica Rod and Rifle Association in their match on Washington's birthday, published in your paper of March 1st, also the pull of trigger? The score is so large that several riflemen here think there must have been some unusually favorable conditions? Ans. A part of the contestants used Sharps and the rest Maynards, all 40 cal.; the former used 50 grains powder, and the latter 46; trigger pull, three pounds; Creedmoor targets. This will answer a number of correspondents.

O. J. S., Richmond, Va.—I am digging a small pond in front of my house, 6 feet deep and 22 feet across. I shall put in a small fountain to supply (and a little more) the evaporation; I will pump it full of well water once a week, letting the old water first run off. It will be bricked and cemented. I wish to know what kind or kinds of fish will thrive in it (not goldfish), how many, and how to be fed? Ans. If you can get some European carp they would thrive, but, with the exception of gold fish, (of the same family) we could scarcely mention a fish that would succeed as well. The common pond fish, such as sunfish, perch, etc., would live, but the drawing off of the water would interfere with their propagation.

I. SCOTT, New Haven, Conn.—A subscriber would feel oblige for information as to the best place within 500 miles of New York for snipe and duck shooting during March and April? Ans. It is not easy to find both kinds of shooting in conjunction at this season, and we can do no better than to recommend you to try some of the points on the Jersey coast, Beach Haven for instance, or Barnegat.

AGILE, Philadelphia.—1. What kind of guns do our first class shots use, breech-loaders or muzzle-loaders? 2. Did Capt. Bogardus use any other than a breech-loader at the Penn. Shooting Tournament on the 22d? 3. How many drachms of Dupont's No 3 Ducking can be shot with safety from a No. 10 Remington? 4. Which is the strongest and best powder to use? Ans. 1 Breech-loaders. 2. Capt. Bogarnus uses a Scott breech-loader, No. 10 gauge. 3. Four drachms. 4. We cannot discriminate between brands of powder.

J. J., Lockport, N. Y.—1. Please tell me in what part of Michigan I would find good mink and muskrat trapping and some duck shooting? 2. Also a proper charge for a double barrelled gun, weight eight pounds, 12 gauge, 31-inch barrels? I shot at a paper 4 by 6 inches, distance, five rods, charge two drachms powder, 1¼ ounces shot; struck it 26 times. Is that good shooting? Ans. In the neighborhood of the more northern stations on the Grand Rapids and Indiana Railroad. 2. 2¾ drachms powder and 1⅛ oz. shot. Your pattern is an excellent one for the distance, but to get penetration at longer ranges you would want more powder.

J. F. L., Pittsburgh.—My pointer pointer pup, 2½ months old, accidenally got at some refuse from sweet breads and ate a quantity. He was fat and lively on Thursday; on Friday was sick and drooping. Threw up all the stuff he had eaten and to-day, Saturday, is dreadfully emaciated and weak. Eats nothing of the milk and bread I give him. Has no symptoms of distemper, and what little comes from his bowels is a good color? Ans. Give your dog ten grains of calomel in dry powder on the back of his tongue, and if the evacuations are too frequent afterwards control them by enemas, of starch water two ounces, tincture of opium fifteen drops, after each passage. Give one grain sulphate quinine three times a day and strong beef tea diet.

F. D. W., Williamstown—1 What is a good recipe for waterproofing a braided fish line? 2. Do the Irish rifle team use the Minnie bullet? 3. Does H. C. Squires, in choking a breech-loader, make it use a larger shell, or does the shell chamber remain the same? 4. Is E. C. Green, of Cheltenham, England, considered a first class maker? What place in N. Y. city can one of his guns be purchased? 5. Would you advise one going to Northern Michigan or Maine to take a Nichols & Lefever breech-loading rifle and shot gun combined? Ans. 1. Boiled linseed oil is good. 2. No. 3. No, the chamber is not touched; the choking is done at the muzzle. 4. Yes, but we know of no one in New York having his guns. Hayden, of Springfield, Ill., is, we believe, his agent in this country. 5. Yes.

A. N. C., Glen's Falls.—Do you consider the Newport model of sail-boat the best, all things considered; if not, which in your opinion is the best for speed and staunchness combined? Please give the name of the best builder of the model you prefer, if it is other than Newport. Also give the address of Mr. Chas. A. Meigs, whose catamaran was described in the *Spirit* of the 17 h inst. Ans. The boat with which we have had the most experience, and the one which we believe to combine to the greatest extent the quality of perfect seaworthiness with speed, is the cat rigged boat used in the Great South Bay for oystering during the season, and for carrying pleasure parties in the summer. By addressing Alonzo Smith, Islip, Suffolk county, N. Y, you could perhaps get a model. We do not know Mr. Meigs' address.

ARTIDAMO, Peekskill, N. Y.—1. What is the difference between a Gildersleeve and Gordon setter? 2. What would be the duty on a canoe costing $35 brought from Canada to the United States? 3. Will you examine the pedigree of my dog, and tell me if you think it true? 4. What light would you advise me to use for floating for deer? Ans. 1. The Gordon is a black and tan, or black, white and tan dog originating in Great Britain; the Gildersleeve is a native strain. 2. Freight and duty about $18. 3. The pedigree is right, we believe, and a very good one. 4. The White Manufacturing Company of Bridgeport, Ct., make the best jack lamp we know of, but we would about as soon use the old-fashioned fire pan for this especial purpose.

G. S., Boston.—I have a setter bitch 18 months old. The mother of her was a Gordon, and the sire was an English setter. Now she is exactly the shape and color of her sire (English setter) and I am desirous of raising some pups from her. Now what breed of setter, the English or Irish (blue blood), would you put to her to raise some first-class pups? Ans. We should prefer to breed her to a Gordon to either, but if the choice was limited to English and Irish, should take the former. We have a prejudice in favor of breeding to color, and by breeding to an orange and white or red dog, your litter would come of all colors. To be sure there are some fine English setters that are black and white, but we cannot recall one of note at present unless it is Mr. Nelson's Quail, by Colburn's Dash.

M. J. R., Rockville, Ont.—To settle a dispute between a friend and myself, would you kindly give a short description of the Spitz dog, size, color, etc., and from whence he derives his name? Ans. The head of a Spitz dog should be fox-like with pointed ears, and going off sharp to the muzzle; eyes bright, flashy and restless; coat thick and long, but the muzzle, eyes and tail carried high and curled over to the hip; The general color is white, although they are sometimes tawny and even black. Their habitat was originally within the Arctic circle, but they have spread all over Europe. The dog found on the eastern coast of Asia, from Siberia to Cochin China, is identical with the Spitz. The name by which he is at present known was given him in England, and probably was applied to dogs first brought from Spitzbergen.

S. W. M., Roslindale, Mass.—1. What is good feed for quail? How is grass seed? Do they need gravel when the ground is covered? Flocks containing over twenty before cast storms when seen a few days since containing over twenty before cast storms when seen a few days since only had seven. Would flock likely to become separated at this season? 2. I have a pointer who was allowed last fall to put up rail, and acquired a habit of trailing nose to ground. Is there any way to break him of it? 3. Do Gordon setters have any peculiar natural qualifications from other breeds of pointers and setters? Are there any bird dogs that are naturally close rangers? Ans. 1. Almost any seed will answer, but they seem to prefer buckwheat. Gravel is not a necessity. Bevies would not be likely to separate at that season, and the chances are that the birds perished. 2. You will have to use the puzzle peg. 3. No. 4. No; it is a matter of education.

D. P. S., Glen's Falls, N. Y.—I have a setter fourteen months old, and his eyes are red at times, besides one of them is so weak he keeps it closed nearly all the time when there is any daylight, and it runs badly at different times. Have been watching to see in your paper some remedy, but have not as yet. To day he will not eat anything, and has vomited a frothy phlegm. Ans. We are inclined to think that the condition of your dog's eye is owing to cold, and considering the other symptoms we should give him a Dovers powder twice a day for two days. Should the eye not improve, and should no further symptoms of distemper be develop d, use the following lotion, applying it with a piece of soft lint laid on the eye: Tinct. arnica, 3 drops; tinct. opium, 6 drops; mist. camphor, 1 oz. You do not mention the condition of the bowels. The book you refer to is "Dinks, Mayhew and Hutchinson," and it is much better than the other you mention. We can send it; price $3.

—B. T. Babbitt's Toilet Soap has a pleasant sound to the ears of mothers, for it indicates something splendidly adapted for children. But it is just as suitable for others as it is unexceptionable in material — this consisting of the purest vegetable oil—and is very delicate in its reaction on the skin.—*Adv.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 8, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

SLAVES IN FLORIDA.—Many of the leading newspapers, including several in this city, are very much interested in a recently published statement that negro slavery still exists in Florida, the original informant and imparter of this startling news being "a gentleman who met a gentleman, fresh from Florida, who informs him that the Seminole Indians, who live in the swamps, are large slave owners."

Now, if those who are interested in this newly discovered fact, will refer to the files of FOREST AND STREAM for 1873 (nearly four years ago), they will find in the issues of November 6th, 13th and 20th, several columns describing in minutest detail the domestic life and status of the Seminole Indians and their dependents, the same being embodied in Chapters XX and XXI of "Hallock's Camp Life in Florida."

FLORIDA TOURISTS.—There is great competition now between the St. John river boats, and the fares from Jacksonville for the round trip is reduced to the very low price of $16, which includes meals and staterooms. Board at the Grand National and other hotels is $3 per day, and there is a general reduction at the boarding houses. The season is early this year; the sun has lately been too hot for a promenade without umbrellas, and travel is falling off somewhat.

BY-LAWS FOR GAME CLUBS.—As we have to distribute a large number of copies of Constitutions and By-Laws to aid the formation of new Game Protective Clubs, all over the country, we shall feel thankful to the Secretaries of Clubs already in existence if they will send us a few copies. Our supply is running short. We beg to acknowledge previous favors of the kind now solicited.

—The regular monthly meeting of the New York Association for the Protection of Game will be held on Friday evening at the Hotel Brunswick. The Senate and Assembly committees on Amendments to the Game Laws are expected to be present.

PUCK.—This German humorous and satirical illustrated journal, will appears on the 14th, printed in the English language.

—Alligators in South Carolina have been out of the mud for some two weeks, and are quoted as lively. They are seldom seen so early.

PROTECTION OF SMALL BIRDS IN EUROPE.

THE good example set some years ago by Prussia, Switzerland, and some of the minor German States, in making stringent laws for the protection more especially of those birds indispensable to agriculture, has gradually been followed by other States of the Continent. In many countries, indeed, there are laws already in existence protecting the species of birds well known and recognized as useful, though, as a rule, they have fallen into disuse. This was the case in regard to Germany a few years ago, but Prussia took the lead in passing stringent laws in favor of the small birds. The killing or exposing, and selling of them upon the weekly markets; the capturing of these birds by means of net, line, snare, etc., was forbidden. Special permission was to be given for the capture of any of the species enumerated in those districts where bird-catching formed a principal means of the subsistence for the populations, as, for instance, some villages in the Harz Mountains, in the Thuringian Forest and elsewhere. In these districts, however, the capture of birds has greatly decreased within the past few years. Prussia did not take the step without first having the opinion of her most celebrated ornithologists and agriculturists; and it was an exceedingly valuable preliminary report, prepared for the Prussian Ministry of Agriculture by Dr. Stadelmann, of Halle, the general Secretary of the Agricultural Society of Saxony.

Though Prussia's laws have been adopted in most parts of Germany, and the movement set on foot has extended to German Austria, it has been found necessary to agitate for an International Convention for the protection of the singing and useful birds, for, while Germany was doing her best to protect, not only her native birds, but also the migratory ones, the peoples of southern Europe took every measure to destroy as many as possible. This charge has been made more especially against Italy, where the slaughter of birds, which has been carried on for decades, was sanctioned by the Italian Parliament in the hunting laws of a few years ago. Year after year the Germans have had to complain of the loss of millions of thalers through the ravages of insects upon whole districts. In 1866 cockchafers inflicted a loss of $1,200,000 upon the fields and forests of four communal districts, in the Harz Mountains. In 1855, nearly five million cords of wood was killed in the East Prussia, Lithuanian and Polish forests, by the ravages of a species of caterpillar. In 1864 and 1865, the Canton of Berne paid out $51,800 for 36,000 imperial bushels of cockchafers and 30,000 bushels of canker-worms. The number of both together was estimated at 2,156,175,000, which, had they lived till the spring of 1867, would have increased thirty-fold—to 64,500,000,000! They would have destroyed the entire harvest in 1867 had not the Canton taken such energetic measures. Similar instances could be recorded by the column. What was the cause of the unusual appearance of these insects? The canker-worm is developed into the cockchafer in the spring, the very time when the migratory birds are accustomed to make their appearance. But birds did not make their appearance in anything like the numbers designed by nature; they had first to pass over the Italian plains and mountains, and millions never got beyond the kitchens of Milan, Florence or Rome. The Italian peasant is the declared enemy of all that flies; everything with wings is palatable to him, and he is remorseless.

German naturalists, like Brehm and Tschudi, have long ago called attention to the fact that, with bird-slaughter in Italy, no protection of birds in the North could fill up the gap in the household of Nature. Brehm says in his *Leben der Vogel:*—

"When the migratory bird first appears in Italy, the roccolo stands upon every hill-top, and his net is in every bush. It is all the same to him if the wanderers be large or small, useful or injurious; he kills them all, from the thrush to the golden-crested wren. And this slaughter is carried on all through the year. The Italian even casts his net o'er the nest of the songster, and sacrifices brood and parent birds to his appetite." And Tschudi complains in his *Thierleben der Alpenwelt* that, not only are the snipe, quail, thrush, pigeon and other game birds captured, but even the swallow, the beautiful garden warbler, nightingales, the little singers of all species, are uninterruptedly hunted in the death bringing "land of the citrons and oranges," without respect of old and young, by merchants, mechanics, priests and nobles, with traps, nets, flint guns, sparrow-hawks, screech owls; and even the hook and line is used during the period of the annual migration. Even Italian naturalists and scientific men have not been silent on this bird-slaughtering business of their countrymen. The Italian Alpine Club has long directed its efforts towards terminating the slaughter. Its organ has published many excellent articles against it.

The old adage that every sin brings its own punishment, is never more strikingly illustrated than in regard to those errors which man commits against nature. The old story of the destroyed forests is ever new. France, Spain, Prussia, Switzerland, Italy, have all experienced the ill-effects of deforestation, in reduced agricultural fruitfulness, in innundations, and sudden changes of temperature. Frederick the Great was a great monarch, but a poor naturalist. One day he found that the sparrows were eating up his beautiful grapes in the Terrace at Sans Souci, and at once ordered them all to be killed. Next year no birds came; but the caterpillars did not leave Frederick a whole cluster of his favorite grapes. The cruel order was then rescinded. The anecdote applies very well to the Italians. Their charges against the birds are that they came just when their luscious fruits are ripe, and do great damage to the grapes; they do not think that if the birds did not come, the caterpillars, etc., would hardly allow a bunch of grapes to ripen. But the bird-slaughter is carried on indiscriminately, no matter whether it destroys insects or grapes, for all make a palatable dish for the Italian gourmand. This fact is admitted by Gastaldi, who wrote on the new game laws of 1869: "Looked at from the scientific standpoint, this law is an insult to the Italian, nay, to European civilization. Its defenders say in substance: The hunting of birds with nets must be permitted in the southern provinces, even during the season where it is prohibited in other places, since the hunting of birds is there an industry, by which the people earn their bread. It must be permitted in Sardinia because it is there a remunerative employment. Lombardy would sooner commence a revolution than give up the hunting of birds with nets, traps, and other means of capturing in use since time immemorial. Unfortunately (says Gastaldi) it is so. In the whole of Italy the unchecked capturing of birds is an employment for the vagabond, by which he makes money; but when people call it under this pretext an "industry," why do we not say the same of begging and other occupations which are stringently punished by moral nations?"

Experience is here the best teacher, and both Italy and her northern neighbor, Austria, have at last felt the necessity of coming to an understanding on the subject of the protection of birds. The southwestern Austrian provinces have of late years suffered severely from the ravages of insects upon the fields, forests and gardens, and naturally the Austrian government lays the charge to the Italian bird-killers, though she too is not guilty of paying too much attention to the protection of the useful birds. The two governments determined to take measures for a correction of the evil, and some years ago a commission of eminent scientists met at Florence and held a conference upon the subject. This was the basis for the legislation which resulted in the present protection laws in Italy and Austria.

STUFFED WHITEFISH ON ICE.—Last week we received from the packing establishment of E. P. Paxton, Esq., at Detroit, a box of fine large whitefish in as good order and as sweet as when taken from the water last fall. There was positively no difference discernible in quality and flavor. We have in previous numbers of FOREST AND STREAM described the extensive fisheries of this establishment, which are located on and among the several islands that beautify the Detroit river, and mark the boundary between Canada and the United States. Mr. Paxton, we believe, furnishes ten tons of these delicious whitefish to a single consignee in this city. He is also extensively engaged in the manufacture of Caviare, which we have also repeatedly written of. Caviare is a preparation of fish spawn, salted and dried.

By the way, this same gentleman sent us a couple of stuffed specimens of white fish, large and fine, a year ago, for our cabinet. So well prepared were they, and so perfectly did they retain their original shape and complexion that it was difficult to distinguish them at a glance from the edible fresh fish which arrived in the box the other day. They have been much admired by those who are fond of ichthyology, and a sight of them has certainly made many mouths water. Now, the editor of this paper intends that it shall be said that "there is nothing mean about him." Generously he apportioned the box of fish among his coadjutators and friends, reserving but one for himself; and messengers were at once dispatched to the domiciles of the several Benedicts, to present the fish to the cook. One recipient (not connected with the office), who resided in New Jersey, preferred to take his own fish home, and meanwhile ordered it to be taken to French's hotel and put upon ice. A faithful observance of his injunctions was promised, and just here, good reader, begin to laugh! No sooner had he gone forth to his avocations, than the fresh fish was dispatched to his home, and the *stuffed fish* sent to the ice. In the evening the gentleman called in due time and took his prize home to his cook and family, and—well, we can only imagine the sensation and bewilderment that followed; we prefer to ring the curtain down.

BIRD SKINS AND EGGS.—Collectors in search of bird skins and eggs will possibly be able to find what they want by examining the very large stock of both at the old curiosity shop of Uncle John Krider, corner of Walnut and 2d streets, Philadelphia. We stepped into his place the other day, and were astonished to find that his modesty had prevented him from vaunting his valuable wares, some of which are very rare.

Uncle John has occupied this same corner for fifty-one years, and though the building is antiquated, one should not judge of its contents from the exterior. The structure itself is very curious, being built of black and red bricks; and this generally received impression is that the black ones are "iron bricks," but Uncle John is reticent on this point. Any person having any curiosity in the matter will do well to ask him.

NORTH CAROLINA.—The Raleigh N. C. *News* thinks the Legislature should pass a law to protect the partridges (quail), and states that up to the 15th of January 50,000 had been shipped, chiefly from High Point, Greensboro, and Company Shops, and the birds still continue to be sent to our markets in large numbers.

GAME PROTECTION.

MASSACHUSETTS.—At the suggestion of the Massachusetts Anglers' Association, two meetings were held in Boston on the 19th and 26th ulto. respectively, with a view to the consolidation of that organization with the various sportsman's clubs throughout the State. At the first meeting a committee of one from each club and association represented was appointed to consider the expediency of a union of all the different associations in the State and report a plan of organization. The committee was also authorized to invite all interested in game and its protection to send delegates to co-operate. At the subsequent meeting Dr. John P. Ordway, President of the Anglers' Association, presented the following resolutions, which were prepared by the committee appointed at the last meeting:—

Resolved, That the Anglers' and the Massachusetts State Sportsman's Associations be consolidated, and hereafter be known as the Massachusetts Anglers and Game Association; its object to be the protection of fish and game.

Resolved, That the several Sportsman's Clubs of the State shall be eligible to membership by the club paying an initiation fee of —— dollars and a yearly assessment of —— dollars. Each Sportsman's Club joining the Association shall have five delegates upon the payment of $10 each annually, who shall be entitled to vote and speak upon any subject which may be brought before the Association at any meeting. Individual membership shall be permitted under the same rules and entitled to the same privileges as now govern membership of the Anglers' Association.

It was subsequently proposed to change the word "game" for "sportsman's" in the title of the Association, and the officers were instructed to obtain such changes in the charter as may be required under the consolidation.

It is undoubtedly a wise move to unite the fish and game interests of the State, as in union there is strength, and the amount of good that can be effected by one powerful Association with ramifications extending in every direction, will undoubtedly be far greater than could be accomplished by many smaller bodies with different interests.

—A Massachusetts correspondent hopes for more spring shooting in that State if the newly drafted laws pass the Legislature.

LAKEVILLE, Conn., Feb. 26th.

EDITOR FOREST AND STREAM:—

In your issue of Feb 22d "Legitimate Grumbler" rather lets the cat out of the bag. He complains that long before the law was off persons calling themselves sportsmen came into his neighborhood and began war on the quail, following them into door yards and gardens, and when remonstrated with they answered with all the slang of a street *gamin's* vocabulary, and "no justice would issue a warrant for their arrest." Now, Mr. Editor, what is the use of any law that is not enforced. If any man who chooses may violate the laws with impunity and insult those who remonstrate with him, of what use is the law. If any so-called sportsman should try that little experiment in our town they would certainly be treated to an interview with a constable before they had fairly warmed to their work; and before they left they would find it necessary to leave a little memento in the shape of a few greenbacks.

Your correspondent says truly that "such things have been a curse to all true sportsmen;" and the best remedy I know of is for the true sportsmen to organize a game club, and prepare themselves for the visits of just such chaps as he describes, and know who to apply to for the necessary papers. Our little club has two lawyers retained as counsel all the time, and we can as easily get a writ for a poacher as for a thief.

Hoping that the public sentiment of Fairfield county will improve in this respect, and that "Grumbler" will soon have no cause to lament such outrages, I am truly yours for Protection, W. H. W.

Our correspondent is right. Sportsmen have the remedy in their own hands, and by forming themselves into clubs, with lawyers retained, can always meet such cases as those alluded to. A club escapes the local odium, and perhaps annoyance, that might be visited upon an individual.—ED.

MICHIGAN.—The committee on game laws of the Michigan State Sportsman's Association met recently at Lansing, and were joined in their discussions by many gentlemen interested in the protection of game. Two committees of five members each were appointed, to draft bills on the game laws and fish laws respectively, and the result of their labors will, it is thought, fully meet the needs of the case and be acceptable to the citizens of the State. The committee have addressed a circular, accompanying the proposed bills, to the Legislature in which they set forth the following facts:—

1. That the deer are rapidly decreasing.
2. That the decrease is not to be attributed to the home consumption, or the killing of deer by sportsmen or farmers for local markets or family use, as it can be shown that the natural increase of the deer will supply this demand.
3. That the decrease is to be attributed solely to the practice of killing deer for export markets. A large majority of the export market hunters are non-residents of this State; consequently any money they receive for their venison they carry with them out of the State at the end of the season, and the land-holders have to stand by and see the game, that by all proper right belongs to them, slaughtered in the snow and shipped away by tons, with a certain prospect of extermination in a short time. * * * * * * To effectually remedy and stop this ruinous drain upon our game supply, we propose to utterly prohibit its shipment from the State for the purposes of sale or profit. * * * * * * Especial attention is called to the following facts relative to the destruction of pigeons in this State, presented a few months since at a meeting of the Kent County Sportsman's Club. This statement refers to the operations of the netters during the spring months of 1876.

"Mr. Hanton of Grand Rapids, in an able paper on the subject of wild pigeons, presented some startling facts with regard to the slaughter by trappers and netters of these once ubiquitous birds. For instance, from the neighborhood of Shelby, Oceana county, on one railroad alone there are daily shipped, at a low estimate, 100 barrels of dead pigeons, consigned to eastern markets. Each barrel contains 30 dozen, which makes a total of 36,000 pigeons every day. Some days the shipments will go over 200 barrels. Calling the shipments from Shelby over other roads at only 14,000 daily, which is below the mark, and we have a total daily shipment of 50,000 birds, or in 50 days—not two months—a shipment of 2,500,000. Is it any wonder that under such a drain as this for the last two years, the pigeons of the United States, which were once plentiful in every piece of woods in the country, are now dwindled down to the comparative handful now nesting in Michigan, and perhaps one or two small nestings in York State.

In the bill proposed, the netting of pigeons is prohibited during the months of March, April, May, and June, which covers the entire nesting period. The killing of pigeons by any means whatever is also prohibited, at or within five miles of the place or places where they are gathered in bodies for the purpose of breeding their young.

VIRGINIA.—A bill is before the Virginia Legislature making a close season for trout from September 15th to April 1st, and for black bass and southern chub from May 15th to July 1st.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

THE INTER-OCEANIC SHIP CANAL—ANIMAL LIFE ON THE ISTHMUS OF DARIEN—BEASTS, BIRDS, REPTILES AND INSECTS.

WASHINGTON, D. C., February 24th, 1877.

MUCH has been written within the past few years in regard to the Inter-oceanic ship canal across the Isthmus of Darien, and circumstances are all favorable to the early inauguration of that great enterprise. It will no doubt be constructed by way of Lake Nicaragua, commonly known as the Nicaraguan route, and the completion of the work will bring about a great change in the present condition of affairs on the isthmus, and vastly increase the population of that locality. As public interest will be directed towards its progress during the next ten years, I hope that the 100,000 readers of FOREST AND STREAM will, to some extent, be entertained by a brief description of the animals, birds, reptiles, and insects of that tropical climate; but first I must mention the fact that the able officer of the American Navy, to whom the country is greatly indebted for the successful surveys which have been made of the isthmus, is himself a true sportsman, as well as an eminent officer. I refer to Commodore Daniel Ammen, Chief of the Bureau of Navigation at the Navy Department, who has made the subject of an Inter-oceanic ship canal the study of his life, and his practical ideas on the subject have proved to be of great value. Commodore Ammen at present resides upon his well stocked farm about twelve miles from Washington, and his beautiful fields often afford fine shooting for his friends, who are always welcome at his hospitable mansion.

The surveys of various routes for the ship canal across the isthmus, which have been in charge of Captain Thos. O. Selfridge, Commodore R. W. Shufeldt, and Capt. E. P. Lull, have developed many interesting facts in regard to that country, and from the reports of Passed Assistant Surgeon John F. Bransford, U. S. N., Dr. G. A. Maack, of Cambridge, Mass., and Surgeon John C. Spear, U. S. N., who accompanied the expedition as naturalists, I have gathered much information in regard to animal life on the isthmus. The country along the Nicaragua route consists of undulating land, gently rising for about fifty miles to a mountainous region; for the next fifty miles up the river San Juan it is hilly, until near Lake Nicaragua, where the land is flat and marshy. West of the lake is a lovely rolling country to within a few miles of the Pacific, where another ridge is encountered—a spur from the Costa Rica Mountains having the general direction of the Pacific coast. Owing to the formation of the country, which is comparatively low and narrow, the trade wind blows entirely across Nicaragua, mitigating the climate and ventilating the country in a most fortunate manner. The seasons, divided into dry and wet, are of nearly equal duration, the wet season beginning about the 1st of June and ending about the 1st of December, though it is interspersed with many clear days, while in the dry season there are occasional rains.

The largest and most formidable animal on the isthmus is the jaguar or American tiger, which often attacks cattle roaming among the mountains, and frequently kills cows that happen to be caught alone, though it is said the cattle make common cause against the tiger, and frequently come off victorious. The animal is inferior in size and ferocity to its cousin of Bengal, but it is of great strength, and sufficiently formidable to make its proximity anything but comfortable. It has been known to drag the body of a grown cow for some distance through the thick undergrowth of the Nicaraguan woods, and it is very dangerous when wounded or hungry. It is rarely met with, however, out of the forests, as it seems to prefer the most concealed life in the middle thereof. In general the animal life is more developed on the Atlantic side than on the Pacific, though as might be expected, a multitude of these denizens of the forest which swarm in tropical woodlands are to be found. The forests on the Atlantic side are full of different species of monkeys, and the loud cry of the roaming monkey, monocolorado of the natives, is heard everywhere. Another species of the same animal is seen sometimes quite tame about the houses, and yet another species, belonging to the genus *Cebus*, is an entertaining monkey, and is common in the houses of the natives. Its cry is like that of a weeping child, and for this reason it has the English name "Weeper." The puma, or Mexican lion, is considerably smaller than the tiger, but old hunters represent it to be quite as savage. There are several varieties of wildcats found upon different parts of the isthmus. The peccary, or Mexican hog, is found at all parts of the isthmus. They are seen more than any other animals, and usually in large numbers. Its meat forms a common dish for the natives. Hogs are reared throughout the country without trouble, the wasteful abundance of fruits and vegetables rendering them extremely inexpensive.

There are several species of deer, besides tapirs, goats, and other smaller animals.

The birds of the isthmus are rich in their plumage, and most frequently seen either in the neighborhood of some huts, or at the less dense parts of the forest. Without going into details, it may be said that the low, swampy grounds of the Atlantic coast are enlivened especially by different herons, jassarras, snipe, sandpipers, kingfishes, cormorants, and other varieties. Pelicans are seen here and there sitting quietly upon an old tree, but they exist on the Atlantic coast in numbers far less than on the Pacific near Panama, where they have their real home. A great many species of humming birds are met with on both sides. As we approach nearer the denser forests the bird life seems almost to end, and one may walk for days in these forests without seeing many specimens of the feathered tribe. Toucans, trogons, parrots, woodpeckers, and goat-milkers are found in great numbers. Among the game birds may be mentioned the pavon, a variety of curassow, about as large as our wild turkey. A male specimen killed on the San Juan river weighed 12 pounds, and measured 38 inches from the beak to the tip of the tail, 19½ inches from tip to tip of the wings. Its flesh is very much like that of our wild turkey, and is much esteemed. Mountain hens and partridges are numerous, and there are countless pigeons of different varieties; rabbits and squirrels are plentiful.

In some parts of the isthmus vampire bats, of which there are several varieties, are found in considerable numbers, and they frequently attack animals at night. The natives close their houses as well as they can to keep them out, and they also find it necessary to put their pigs, mules, and other domestic animals into houses to protect them. One species of this bat is as large as a half-grown chicken, and its wings, when extended, measure across from two to three feet, while another sort is not larger than a meadow lark. They were found very troublesome in the Chimalapa region, where they attacked the animals belonging to the Shufeldt expedition nearly every night, inflicting oftentimes two or even three bites on the same horse. The opening they make in the skin is round, with clean cut edges, and about a quarter of an inch in diameter, but does not penetrate much below the true skin. It is not uncommon to find blood oozing from the opening several hours after the bat has left. The neck of the horse or mule is the part most generally attacked. Two servants attached to the party were bitten one night. They said they did not feel the bat until it flew away, which waked them; they also said the wound was slightly painful, but they did not complain of feeling weak from the loss of blood. In one of them, to arrest the hemorrhage, it was necessary to apply a small compress to the opening. An old Indian was authority for the statement that two bites of a vampire the same night generally proved fatal to an infant. The vampires dislike light, however, and it is stated that they will not attack any one in a room if the candle be lighted.

The rivers of the isthmus abound in fish of nearly every size and variety from the *Zavalo real* to the sunfish. The former is very large. One that jumped into a boat at Castello weighed 62 pounds. The flesh is coarse, but it is eaten by the natives. Another species of the same fish is much smaller, weighing from three to six pounds. This fish is an industrious scavenger, still it is enjoyed by the natives, and is said to be good when caught in an unfrequented part of the river and well cooked. The *Juapote* is a game fish for sport. It is eight or ten inches long, a little broader than a chub, and makes a delightful fry, besides these there are many varieties of perch and sunfish. The manatee is found in the rivers and lagoons, and its flesh is prized as an article of food. The family *Siluridæ* is well represented in all the rivers of both sides. Two species of these fish are found. They are often spoken of by the natives, and many curious tales are told about their habits, how they can live on land as well as in water, etc. The fish life of the isthmus is also well developed near the shore of both oceans, as well as in the different rivers. Although the fish fauna of these rivers cannot be compared in its richness with that of the South American rivers, it possesses, nevertheless, in comparison to the short run of most of the streams, a great variety in its forms. Several of these fishes give an important food for the natives, who dry them in smoke. The Bay of Panama especially is filled with many varieties of fish, and they are much more plentiful there than in the Gulf of Darien on this side. Alligators abound in the rivers, and sharks are found in the San Juan river and Lake Nicaragua. They also abound along the coast on both sides of the isthmus, but do not seem to be very voracious, for the Huane Indians are frequently observed standing waist deep in the water a considerable distance from the shore at the mouth of the Tehuantepec river, with hundreds of large sharks swimming leisurely along quite near them. The natives say that the alligators destroy a considerable number of young cattle. Shooting these ugly reptiles affords tolerable sport, and so numerous are they that one person might easily dispatch a dozen or more in a few hours. Upon one occasion a party attached to Commodore Shufeldt's expedition came upon a huge alligator some distance from the water in an open space, and in chasing him, in order to get near enough for a good shot, it was discovered, much to their surprise, that he ran as fast as the party, and for a part of the way his course was up a hill.

The reptilian life is everywhere on the isthmus well developed. Snakes, lizards, frogs, scorpions, tarantulas, and numerous other reptiles abound, together with myriads of insects of every variety. Snakes are very numerous and of countless varieties. One of the most conspicuous is the coral, a beautiful snake about three feet long with black and crimson bands. This snake is much dreaded by the natives, who represent its bite as deadly. An officer with Capt. Lull's expedition speaks of having killed several. At first they attempted to escape, but when baffled in that design they became very savage, one of them striking fiercely, and then burying its fangs in its

own body when pinned down. The toboba is a much larger snake marked something like the moccasin of the United States. The hunter entertains the most inveterate animosity towards this snake, and will spend time and labor to kill one. It has an odor something like that of an alligator. There are several snakes of the boa family, and numerous very small serpents of extremely venomous character. There are many very poisonous snakes, the bite of which can kill a man in a very short time, but these snakes hunt their food mostly at night, and it is quite rare to meet them in daylight when they prefer to rest. The zoological names of these poisonous snakes are *Bothrops lanceolatus, Teleurapis schlegelii, Lachesis rhombeata, Elaps semipunctatus,* and *Elaps fulvius.* Another kind of poisonous snake lives only in the sea along the Panama coast, and is seen very frequently. The zoological name for it is *Pelarnys bicolor.* This snake abounds also on the shores of Celeber, Bengal, Malabar, Sumatra, Java and China. Snake bites among the people in the woods and mountains are of frequent occurrence and the surveyors of our expeditions always had a party of natives ahead cutting the trail, and these old hands killed a great many snakes, besides the men wore thick canvass leggings, and were always on the lookout for them. Parasite vines of all sizes and colors, and festooned in every imaginable form are so common that a snake hanging from the limb of a tree would often be unnoticed by the officers and sailors, though never by the machetéros, who seemed to be on the constant lookout for them. Occasionally one of the former would suddenly feel himself seized and jerked back, and would find that the keen eye and the strong arm of one of the natives had rescued him from an enemy that he himself had not seen, though perhaps looking directly towards it, and not a yard from it. The annual fires that sweep over the whole of the uplands destroy a great many serpents with their young and their eggs, and the yearly overflow of the lowlands has a similar effect. The vultures and the pecaries also kill a great many of them. Tarantulas are very numerous, especially on the table lands, and they are generally very large. As they never bite except when pressed upon, they are not troublesome. It was a common thing for those attached to our surveying parties on the isthmus to find a large tarantula in their tent, or even between their blankets in the morning. Horses not unfrequently step on them in the field, and if it is not crushed bites the frog of the foot; as a consequence the animal is often lame for several months, and oftentimes the hoof falls off. Scorpions are met with quite frequently, but they are generally small and not very poisonous. Several of Commodore Shufeldt's party were stung, but the pain in every case was very slight, and there was no swelling. There are, however, several poisonous specimens of this reptile on the isthmus. A dear-bought experience on the part of one or two officers and men taught all to examine very carefully their clothing, and especially their boots and shoes, before putting them on in the morning. The scorpions, with snakes, tarantulas, myriads of insects of various sorts, and innumerable lizards of all sizes and colors, are things to keep a nervous person in a constant state of agitation. The lizards, to be sure, are perfectly harmless, but it takes some little time to get so used to them as not to mind their extreme familiarity. Iguanas, a species of lizard, are exceedingly numerous, and are highly esteemed for food by the Indians, being preferred to beef or chicken. The larger and more esteemed sorts are found along the banks of the unfrequented rivers, high up in the mountains. The Indians catch the reptile in a trap, and also chase it into its hole in the earth, and then dig it out. The iguanas are kept alive and sold in Jalipan and Acayucam for about fifty cents each.

Of the many hardships the members of our surveying parties encountered in exploring the isthmus, none were so trying as the bites of the numerous insects which infest that region. Both the covered and uncovered parts of the body were attacked, and each by a different class of insects, nor did the day time or night time afford any certain relief. There is no doubt that the loss of sleep which these troublesome insects cause, and the irritation of the system induced by their bites, which sometimes become large sores, are often strong, predisposing causes of the malarial fevers of the isthmus. The mosquitoes are for the most part confined to the Atlantic plains, but in the rainy season they are met with on the Pacific side, and even on the high table lands. Near the Atlantic rivers there is no season of the year when one can sleep at night unless protected by a mosquito net. Our first exploring party was supplied with the ordinary netting used in this country, which a little experience proved to be entirely worthless, for the mosquitoes penetrated it with the greatest ease. The party had to resort to the netting used by the natives, which consists of ordinary thin muslin. This, although it affords protection against the mosquitoes, cannot be commended for the ventilation it allows the sleeper. The natives, however poor, invariably have their rude beds protected by a mosquito net.

When the United States steamers Kansas and Mayflower arrived at Minatitlan, in 1870, the officers and men attached to these vessels were unprovided with mosquito nets, and for several days, until a supply could be obtained, not a person on board closed his eyes at night. The officers, driven from their cabins, betook themselves to the deck, where they walked and smoked the whole night long. The sailors wandered about the ship like madmen, now climbing up the rigging and resting for awhile in the top, and then descending again to the decks; but no relief was to be found anywhere. The nigua is a small black insect, which resembles a flea. It burrows slowly under the skin, without producing any pain, and deposits there several hundred minute white eggs, about which a sack forms. In the course of a week the sack, with its contents, has attained the size of a pea, and can be seen slightly protruding from beneath the skin, and at this stage is generally attended with a slight itching. By inserting the blade of a knife between the sack and the surrounding flesh the former can be easily enucleated entire, after which the cavity heals rapidly. If, however, the sack is broken, and some of the minute eggs escape into the surrounding tissue, they may continue to multiply, producing oftentimes ulcers which are troublesome to heal. The nigua, like the tick, is troublesome only in the dry season, and is more abundant on the Pacific coast. The Indian boys are very expert both in finding and extracting them, and therefore it is a good plan to have one's feet (for this is the part where they are generally found) examined once a week or oftener. Fleas are plentiful in all parts of the isthmus, but they are most abundant on the Pacific side. Fortunately they are limited to the towns and Indian huts, and one is not much troubled by them when living in the woods or in camp.

The Moyaquil is a worm which grows in the flesh, and the Indians say it originates from an egg deposited under the skin by a certain fly. The presence of the worm is not noticed until it has attained a considerable size—an inch or more in length—when suddenly the attention is called to it by the flesh near it becoming swollen and inflamed, and exceedingly painful. The Indians are very expert in extracting it, which they do by applying to the head of the worm (which is visible just under the skin) some resin found in the forest. This is allowed to remain two or three hours, when it is removed, and the worm is found to be dead, and is easily extracted by manipulating and squeezing the flesh. The moyaquil, however, is not very common, and is confined to the Atlantic slope. The Garrapatas, or ordinary ticks, do not differ from the same insect found in our own country, except that on the isthmus they are much more abundant. They annoy animals much more than man, and it is no uncommon thing to see horses and mules that have their ears eaten off by the ticks. It is the common practice among the residents, after a ride on the plains or a walk in the woods, in order to free themselves of Pinolillos, which are the very smallest ticks, to bathe the whole person in aguardiente—the native rum—which has the effect of detaching the insects entire. If it is attempted to pick them off, the head is often left buried in the flesh, and causes a great deal of irritation. The myriads of ants that infest the country are very annoying. They sting painfully. A person thoughtlessly picking up a piece of bark or old wood will find his hands to feel suddenly as if they were on fire, and a glance shows the savage little fellows very effectually bringing themselves into notice.

The animal life of the invertebrata is richly developed in the isthmus. Beetles, locusts, crickets, termites, bees, wasps, are all represented in many species. Centipedes, millipedes, spiders and bugs of every description exist in the greatest abundance. The enormous amount of vegetable matter, the decomposition of which is favored by the heat and moisture, produces a malarial poison, and as a consequence malarial fevers are the prevailing diseases among strangers. Foreigners in the hill country generally enjoy good health in proportion as they obey the sanitary requirements of the climate. Essential points are the use of vegetable diet, fresh animal food, and temperate and cooling drinks, avoiding the fats and oils and intoxicating liquors, frequent bathing, and general cleanliness, and avoidance of the mid-day sun.

Rifle.

SPORTING RIFLES FOR THE PLAINS.

In that portion of Col. Dodge's excellent book entitled the "Plains of the Great West," which is devoted to Game and Sporting, the author is particular in designating the proper equipment for all kinds of service. With regard to the selection of a rifle, he says:—

"For all large animal game he must have a good breech-loading rifle, of calibre not less than forty-five, and plenty of the best ammunition. The arrangement of sights and triggers is a matter of taste and habit, but it is of the gravest importance that the sight, however arranged, should be exquisitely fine. Personally, I most decidedly object to elevating sights for the rifle. Out of ten deer or other animals, at least nine are overshot. Either from excitement, or because the game appears dwarfed in the wide expanse of the prairie, even the most experienced sportsmen habitually overestimate distance, and the tendency to put up the elevating sights is so irresistable that nearly every successful sportsman of my acquaintance has discarded this sight entirely. Besides this the use of the elevating sight does not in the least solve the problem. It does very well for shooting at a target where the distance is accurately measured; and if the sportsmen could only induce the deer to stand still at five hundred, six hundred, or eight hundred yards, he might estimate the distance and hit it. But the deer fails to be so accommodating, and will insist on stopping at six hundred and fifty and seven hundred and thirty-seven yards, or some irregular distance of which the sight takes no account. Moreover, as the trajectory of these high ranges must be necessarily greatly curved, the chances are infinitely against the sportsmen. He must first guess at the distance, then put up the elevating sight nearest that distance; then guess again as to whether a fine or coarse sight ought to be taken through the sight as now arranged."

This is valuable information for our Creedmoor and other long range shooters, and to the students of Rifle Practice generally, in determining the utility of target practice in general field service, either on game or in battle. We have always urged the necessity for a regular judging distance area. The author continues:—

"The very best sight, and the one almost universally in use by sportsmen and professional hunters on the plains, is the plain "buck-horn," a description of which is unnecessary, as every gunsmith knows it. The very large mass of game "bagged" is killed inside of two hundred yards. A good gun will carry a ball to that distance with almost a flat trajectory.

Of the best gun I ever owned, the line of fire never cut the line of sight at all, but was tangent to, or coincident with it; in other words, the gun did not shoot too high at any distance, and I took precisely the same sight at an object at ten feet as at one hundred or two hundred yards off. This is very unusual, but a gun is good as it approximates to this extreme accuracy. After two hundred yards, however, the curve of the trajectory of even the best gun increases with great rapidity, and it is only by constant practice that the sportsman can keep himself to the mark at long ranges. Sportsmen who use the "buck-horn" must learn to sight "on the barrel." With practice there is no reason why this should not become second nature; and a sportsman soon learns to take his sight at a distant object, and elevates his gun to the proper angle just as the trombone player learns by practice to stop his hand at the exact spot to give the correct tone."

The Colonel recommends shooting with both eyes open—"the right eye to keep the line of sight and estimate the distance "on the barrel," and the left to obtain "a clear view of the game and its surroundings." He recommends a hair trigger, and prefers the old-fashioned Kentucky double set trigger. He does not like the single-set or the French double-set trigger. He thinks our soldiers would be well armed provided the very excellent Government rifle had proper sights and triggers. As these now are, the men make bad work indeed at shooting. As between rifle and shot gun, if the choice of the hunter is limited to one arm, he should take the rifle, if he knows how to use it.

One word of encouragement the Colonel gives to our Rifle Associations. He says:—

"The rifle shooting now becoming so fashionable, is destined to work great improvement in the use of arms. It is, however, only a step in the right direction. The trials, as at present conducted, are rather tests of the rifles than of the men. When these trials have progressed until men begin to compete at distances unknown to and estimated by themselves, without elevating sights, off hand and necessarily with light triggers, then the maximum of efficiency and skill is not far off. Then must the soldier put in practice such shooting as he must necessarily use against an enemy."

The following simple rules of practice are indicated for sportsmen to observe- Always shoot against or across wind. Look sharp. Reconnoitre your ground before you approach. Go slow. Keep out of sight. Never fire when you are panting with exertion. Get a vent for your rifle when you can. Don't shoot too high. Never approach game that is down until you have reloaded. When game is alarmed and runs off don't attempt to follow. Seek elsewhere.

THE WHITNEY ARMS COMPANY.—We are informed that Judge Shipman, acting as U. S. Circuit Judge, on Monday, the 22d of January, at Hartford, Conn., decided the case of the U. S. Rifle and Cartridge Co., and E. Remington & Sons, vs. The Whitney Arms Co., in favor of the defendants, dismissing the bill. The suit is based on what was known as the Cochran Patent. The Judge finds Cochran's invention to have been abandoned to the public. This is the principal suit against the Whitney Arms Co., upon which infringement could be claimed by E. Remington & Sons. The Whitney Arms Co. will protect any party buying or selling the Whitney gun, in case of any suits from any party, for alleged or pretended infringement.

SUB-CALIBRE RIFLES.—I have often wondered why some of the large companies like the Remington, Sharp, Winchester, &c., have not turned their attention to making sub calibre rifle barrels to fit in barrels of ten and twelve bore shot guns. Many owners of breech-loaders would be glad to purchase such barrels, if sold at a reasonable figure. One firm in this State makes them, but the price—$35—appears to me to be too large. With the extensive facilities at the command of any of the above mentioned companies, they ought to be able to make and sell such barrels for $10. Other useful appendages to a breech-loader would be a pair of steel shells enabling it to be used as a muzzle-loader, should circumstances render such change desirable or necessary. B. L.

[We approve of our correspondents suggestion and hope to see it adopted. We once had in this office a breech-loading gun made by a celebrated French manufacturer that was fitted, in the way he suggests, to be used as a muzzle-loader. A pair of conical base brass shells fitted in the barrels and the strikers being unscrewed a pair of long nipples took their places. The ramrod was very small, of steel, and answered as a cleaning rod as well.—ED.]

—The Amateur Rifle Club has referred the invitation from the Irish Rifle Association to send a team to Ireland this summer to its Executive Committee, with instructions to communicate with all rifle clubs in the country with regard to joining in the competitions for places.

GOOD SHOOTERS.—We have received a common yellow envelope in which are six bullet holes made by Mr. G. F. Willis, of Putnam, Conn., with a Remington rifle at 100 yards distance, off-hand. As these shots would all be within the carton of Creedmoor target, and considering that Mr. Willis is 56 years old and had never seen the rifle before the day he shot it, the shooting is wonderfully good.

RIFLE NOTES.

L. Weber, American team, has gone to California for his health.

C. E. Overbaugh, who did so well at Creedmoor last week, has been trying his hand at billiards this winter. He don't move the ivory balls quite as well as he does the leaden ones.

The fate of an International rifle match this year is now in the hands of the rifle clubs throughout the country.

Yale wants to back his "lemon and white setter" against Judge Gildersleeve's dog. There is no chance for the "setter;" his pedigree cannot be traced.

L. M. Ballard has invented a "locking cork," so that no one can steal a drink from a bottle locked with one of his corks. How about stealing the bottle?

E. H. Madison, who won the bronze medal presented to the Amateur Rifle Club by the N. R. A. last November, had the honor of carrying off the first prize in the pigeon match at Jamaica, a short time ago.

Judge Smith made some splendid "word" shooting at Conlin's Gallery last week.

Lying-down shooting is a specialty at Hellwig's Gallery.

A match in the lying-down position is the next thing on the programme at Miley's Brooklyn Gallery.

Bogardus is in the city. He is making arrangements for a large match to shoot at glass-balls thrown from a trap. He thinks shooting at them is almost as good practice as shooting at pigeons.

The riflemen of Spy-Pond Range, Boston, are talking of challenging any team from New York or vicinity to shoot an off-hand match. The Jamaica Rifle Club are doubtless ready, judging from their splendid scores.

L. C. Bruce, American team, cannot shoot at Creedmoor to any extent this year through press of business.

An Inter-State match, allowing four different teams to enter from each State is suggested.

Thirteen thousand dollars were expended in rifle competition last year by the Dominion Rifle Association of Ottawa, Canada. How much does it cost the N. R. A. for prizes?

Fulton is interested in the Maynard rifle now. He will shoot that rifle this year in the long-range matches.

A match between the riflemen of Brooklyn and New York, at long-range, will probably take place at Creedmoor this season.

After the meeting of the Amateur Rifle Club, which was held at the Seventh Regiment Armory last week, C. F. Robbins invited the members to see the rifle range situated in the basement of the building. Two teams were formed, and quite a rifle match took place.

NEW YORK.—The 22d of February was observed by the Saratoga Rifle Club in the following manner: Messrs. Howard and Ainsworth were appointed captains, to choose sides of all the riflemen who would participate in a match for an oyster supper, conditions, etc., N. R. A. rules, except that any gun and trigger was allowed. The following were the teams and scores; distance, 200 yards.

HOWARD TEAM.		AINSWORTH TEAM.	
Name.	Score.	Name.	Score.
H. W. Hayes	41	Odell Gates	41
Irving Davis	41	W. H. Benson	40
John Webb	40	J. Armstrong	39
O. H. Crowell	40	J. W. Shutter	39
O. J. Wing	40	W. Odell	39
J. M. Andrews, Jr.	39	J. Piney	39
A. G. Warriner	38	W. J. Leggett	38
John Meody	38	G. W. Ainsworth	38
J. H. Farrington	38	B. W. Amsden	37
J. N. Ramsdell	37	J. Hays	34
W. F. Howard	37	G. T. Walker	34
Daniel Eldy	36	J. W. Fonda	30
Total	173	Total	146

The Howard team won by 26 points. After the match the vanquished side escorted their victors to an up-town hotel, where all partook of an elegant supper.

CONLIN'S GALLERY.—The Amateur Prize shooting match ended Feb. 28th. It commenced January 10th, and was liberally patronized by most all of the amateur indoor riflemen of this city. The well known names of the crack shots of the gallery do not appear in the list of winners, as they were all "barred out," and termed experts. The conditions of the contest were ten shots; rifle, 22 cal., off-hand; 110 feet, at ready measurement targets, by which a string of shots can be measured from center of shot to the center of bullseye to the fractional part of an inch. The total number of competitors was about 100. The following gentlemen are winners of prizes; their scores are the measurement of the ten shots:—

Names.	Inches	Names.	Inches
Frederick Kessler	7/8	W. H. Smith	10 1/2
J. D. Greever	8 3-16	W. Klein	10 15-16
M. B. Engel	8 1/4	W. R. Brown	11 1-16
Walter Campbell	8 1/2	L. G. Bruce	11 2-8
Thomas Wilds	8 6-8	Winners of Minor Prizes.	
L. Bird	8 15-16	Names.	Inches.
B. S. Brown	9	N. B. Thurston	11 3/8
C. E. D. Forest	9 1-16	G. A. Baker	11 7-16
T. C. Soone	9 5-16	E. Backofen	11 1/2
B. Zeltler	9 9-16	D. A. Carr	11 9-16
G. R. Grohman	9 7-16	Homer Lee	11 3/4
M. L. Rugg	9 15-16	M. P. Lennon	11 6-8
D. D. Miller	10 1/4	D. D. McQuilan	12 1-16
Frank Murch	10 5-16	G. J. Work	12 1/2
P. Fenning	10 7-16	L. Harris	12 15-16
A. G. Hellwig	10 13-16	A. Keltz	13 3-16

The first competition for the Amateur's Badge took place at Conlin's Gallery last Monday evening, March 5th. The badge is a gold one, beautifully designed and made by Wm. Hayes, of Newark, N. J. It is to be won three time, not necessarily consecutively. All those who have made better scores than 46 out of a possible 50, or winners of gold badges or first prizes, are "barred" from entering the competitions. The conditions are as follows; 10 shots; rifle, .22-cal.; off-hand range, 110 feet; 200 yards Wimbledon target reduced for the distance; Creedmoor rules to govern the match; entrance fee, fifty cents. The following are the best scores: L. C. Bruce winning the badge.

Name.	Total.	Name.	Total.
L. C. Bruce	43	W. R. Hewitt	36
M. L. Rigg	41	Homer Lee	35
P. Fenning	40	Thos. Fenton	34
Thos. Wildes	40	McDowler	34
F. Murch	38	T. C. Soone	34
A. E. Long	39	W. B. Brown	33
M. B. Eagle	38	L. Bird	33
B. S. Brown	38	G. Williams	32

DOMINION RIFLE ASSOCIATION.—At the Dominion Rifle Association annual meeting held at Ottawa, Ontario, March 1st, the report read shows that $13,000 were expended in rifle competition during the year. Twenty-seven associations affiliated during the year. The President read a letter from Lord Warncliffe accepting the Dominion Challenge Trophy, presented by the Association to the National Rifle Association. The Dominion Government will give gold medals to the members of the Kolapore team of 1877. The election of officers was held and the meeting adjourned for a week to allow the Committee time to revise the rules.

Game Bag and Gun.

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, &c.

DUCKS ON LONG ISLAND.—The ducks came into Shinnecock Bay last Friday, and brother Lane telegraphed the news to the city, whereupon the gunners who had slept on their arms for some days past set out instanter, and we understand had excellent success.

—Since the ice disappeared the tributaries of the Chesapeake Bay (Md.) have been full of wild ducks.

—A well-known physician of this city, now in his sixtieth year, has been having some fine shooting lately in Georgia, where forty-nine quail and one hare dropped to his gun on one day.

MASSACHUSETTS—*Chassett, March 1st*, 1877.—Our season for spring shooting just commencing. First ducks shot this week—shelldrake and dippers. A large eagle was shot here lately, measuring over seven feet, an off-hand shot at 225 yards, with a Frank Wesson 32, by a young man only seventeen. S. K., Jr.

MINNESOTA—*Nob'es County, Feb. 28th.*—Captain Ducaigne, a bibliopole from Porkopolis, desiring better air than that in a sooty town, went to the northwest and finally selected a homestead and shooting box in Nobles county, Minnesota, to which he makes semi occasional pilgrimages. This county, containing many lakes, 178 miles southward from St. Paul, has within its borders the highest land in the State. Sometimes this region can supply a few "grasshoppers," while of other sorts of game common to a prairie State it furnishes an unstinted variety. D. says in a recent note, that "a large, grey prairie wolf, was caught two weeks since, near Worthington, by Mr. Brant. He heard of the lupine gentleman, and succeeded in nabbing him with a ten pound trap. There is a bounty of $3 on each wolf, which, with the skin, will make the animal net Mr. B. about $5. So far this winter the same man has caught nine foxes. In this part of Minnesota appearances indicate an early spring. The eagles at Graham Lakes have already commenced to build their nests."

DEER HUNTING IN WEST VIRGINIA.

MOOREFIELD, Hardy Co., W. Va., March 1st.

EDITOR FOREST AND STREAM:—

I wish that space in your valuable columns would permit me to set forth some of the attractions which the Moorefield Valley, W. Va., offers to those seeking sport at deer hunting. Perhaps some of your readers are familiar with Porte Crayon's descriptions of it. It is the "garden spot of the old Dominion's virgin daughter.

In December last I was the favored guest of Hampton Hider, Esq., of this valley, and to his hospitality, his hounds and horses, I am indebted for a month's pleasure and sport. At the northern end of the valley the south branch of the Potomac finds an exit between two lofty mountains, forming a miniature cañon for a distance of five miles. In this "Trough," as it is called, are situated the deer stands. The most famous is the "Sycamore," which takes its name from an old sycamore stump, now used as a seat for the watcher. I feel confident in saying that there is no other spot in America upon which as many deer have died. The river here is about eighty yards wide; above the stump there is a a beautiful cascade, and below a riffle; back of it there is a gap in the mountain down which the deer come to reach the river, the mountain being too steep at most other points. The hounds are started across the mountain, several miles distant, and rarely fail to bring their game to water. I have known as many as eleven deer to be killed at the Sycamore in one hunt, and it is nothing uncommon to kill from three to five. I had the good luck to knock over a buck and doe in one morning, not twenty yards apart. The Sycamore is used by the bears as a crossing point in winter. Nine crossed in two days during our Christmas snow storm. Unluckily no one was there, and so they only left their tracks with us. The hounds of this region are descended from stock imported when the people were in better circumstances, and are fine specimens of the hound species. Mr. Hider's gyp Bashful, is known throughout the whole valley, and well she deserves her reputation, for a fleeter or more sagacious deer dog never put foot to ground. No spot the hunter ever dreamed of could afford him a prettier shot than the Sycamore. He may see the noble buck as he comes bounding down the gap and hear the deep-mouthed dogs. What a sight! What music! for the hunter! The deer generally stop at the river's edge, but, if let alone, they plunge into the river and swim down or across, so the hunter may choose his shot, running, standing, or swimming, as he fancies.

When the deer are not in season the lover of hounds may still find good sport in fox-hunting. Yes, as good as old England affords, except that the country isn't open enough for fast riding. Small game abounds in great quantities. SYCAMORE.

SINGULAR CAPTURE OF DEER.—A California correspondent, T. H. E., of Nicasio, sends us the following: "On Saturday last, as the passenger train was passing near Olema, it came suddenly upon three deer, a buck and two does. The latter made their escape, but the buck jumped up a bank where he became bewildered, and sprang against the express car with force enough to break the door and his own back."

ENGLISH AND AMERICAN GUNS.

NEW YORK, Feb. 28th, 1877.

EDITOR FOREST AND STREAM:—

Your correspondent, "Forty Five," in the issue of Feb. 22d, is, I think, rather disposed to be harsh, at the same time not being able to say anything against American guns. He did say a great deal in praise of English guns in his Centennial article, but had not a word to say about home manufacturers. When this omission was made apparent to him, he for the first time avows his intention of saying something about "our guns," and begins an effort to run down the Remington gun, but the gentleman is so frank, that he can say nothing worse than that Messrs. Remington make a good gun for $45, which he seems to think is criminal and unfair to English makers. For the fact that they do make a good gun for $45, I can vouch, having shot one for several years, and so far as shooting is concerned, it can not be beaten. The locks are equal to any I ever saw, and the barrels (cylinder) are as good as any in the market. These are the only re l essentials in a gun, everything else can be obtained by those who want "a beauty," and are willing to pay for it. Remington's make a pretty gun for $75, but I do not believe it shoots any better than the $45.

As for the Parker and other home made guns, I believe them to be good and equal to imported guns costing twice as much. Some prefer one action, and some another, but this is a mere matter of taste, they all do their duty, and the matter is boiled down to the chief requirements of a good gun, the inside finish of the barrels, and good locks; qualities claimed and justly so too, by the Remington's.

Mr. Hepburn is an entire stranger to me, but I must fully indorse all that he said about "Forty Five's" ignoring American guns in his Centennial article. I, with my $45 Remington, killed a quail nearly 80 yards distant, and have made many other good shots.

The gentleman can have my address by calling at the office of FOREST AND STREAM. A. B. B.

[We fear that our correspondent in his zeal is rather over doing the thing. He surely would not have our readers believe that the decarbonized steel barrels on a $45 gun are as good as laminated or Damascus, and yet he says plainly that they are as good as any in the market.—ED.]

CURIOUS GUNNING ACCIDENT.—A correspondent sends us the following particulars of a very remarkable accident which occurred to a friend of his while shooting in Maine:—

"Mr. S. P. had a Steven's breech-loader, with which he was trying to shoot some birds. His shell was one of Union Metalic Cartridge Co.'s make. The cap, or primer, was a common G. D. cap. The shell had been loaded about four weeks and exposed to wet. It is not certain what make of powder was being used, but my friend thinks it was made in Maine. He struck the cap with the hammer three times and as it did not explode, he opened the breech of the gun, took out the shell, turned it up to look at the cap, when it 'went off,' the charge going into the ground. The shell broke his cheek bone and tore the flesh up to the corner of his eye, and has not been seen since. The question is was this an improper use of ammunition, or was there a defect in the material? Or on account of wet did the thing 'hang fire?' Will some one rise and explain? If the FOREST AND STREAM cannot answer, it must be a case among the lost arts."

It would be desirable to know whether the injured party heard anything like a snap from the cap. We are inclined to think that the powder nearest the cap had become damp and burned for an instant slowly until the fire reached the dry powder, when the explosion occurred.

PIGEON MATCHES.

PHILADELPHIA, March 1st, 1877.

EDITOR FOREST AND STREAM:—

Having witnessed the pigeon match at the New Hunting Park, I fully indorse your report respecting the arrangements under which it was conducted, and I was surprised that Mr. Bogardus participated in it, after being subjected, as the shooters were, to the continuous annoyances and difficulties by the promiscuous crowd. There was another feature about the match, which, to my mind, rendered it anything else than a fair test of skill. I allude to the latitude allowed in the use of *guns* and of *powder*.

Without in any way retracting from the reputation of Mr. Bogardus, I am constrained to state that the best score made was by Richard Wood of Lazaretto. He used a No. 10 Scott gun, and but *four drachms of powder*, and *killed all of his birds outright*, while a large majority of the birds shot by the rest, who used from *one-half to three-fourths more powder than he did*, were crippled (large numbers of them only wings broken), and were gathered with difficulty in many cases. This, to my mind, proves that Mr. Wood covered his birds *fully*, while a great many of the others secured theirs by mere chance, and I think he is entitled to the credit of having done the best shooting. This is the opinion of a great many gentleman, who have no more personal interest in the matter than I have.

I should like to have your opinion on the merits of this question, for it seems to me there can be no *real* and *fair* test except *under uniform conditions*. A great many of the birds, especially the second day, could not have been killed outright with four drachms of powder *unless fully covered*. Will you please give your readers the benefits and judgment as to what constitutes a fair match?

Yours, respectfully, M.

[A fair match is one in which the prescribed conditions are fully complied with, and whatever might be the relative merits of the shooters or their guns, when birds were fairly gathered within the boundaries, they were as rightly credited as though they had been killed within ten feet of the trap. We observed, on the first day, a large number of wing-broken birds, and have no hesitation in stating our conviction that the shooting of tame pigeons from ground traps entails a needless amount of cruelty and suffering, and should either be done away with entirely or the use of the second barrel permitted, that the bird might be put out of his misery. With plunge traps and wild

birds it is quite different, and the number of wing broken birds is comparatively small. With regard to Capt. Bogardus in the late match, we fancy that the dimensions of his gun (his Scott 10-bore) were very similar to those of Mr. Wood's, and it was remarked by us and a number of others that from the report, he appeared to be shooting but very little powder. Mr. Wood certainly killed his birds in as clever and neat a style as we ever saw in a match. As regards the "cannons" and canister loads of powder used by some of the contestants, we consider it a practice as obsolete and old-fashioned as the system of depletion is in the medical practice; and it is our belief that if some of the old time shooters would try modern guns, they would find that a pigeon can be killed as easily with four drachms of powder as he can with eight. Indeed, in England and on the Continent, where there are as fine shots as in this country, seven pounds, or seven and a half, is the average weight of the gun used in shooting pigeon matches, and three and a half drachms of powder the charge.—ED.]

CAPT. BOGARDUS' NEW TRAP.—Capt. Bogardus has invented a trap for throwing glass balls which affords excellent practice and promises to become the most popular substitute for pigeon shooting. Its best quality is its cheapness, the great difficulty with most other traps and gyros being their cost, which places them beyond the reach of most individual sportsmen. Capt. Bogardus gives an exhibition shoot at the Hippodrome this week, when he will break a thousand glass balls in two hours and forty minutes. The traps are advertised in another column.

The Kennel.

For Forest and Stream.

DOGS—NO. 4

It must be at least forty-five years ago, that an emigrant vessel, bound to Quebec, was wrecked on the coast of Newfoundland; I think in the vicinity of Carbonear. It was late in the fall, and after a stormy night a fisherman rose early to ascertain what waifs the Storm King might have brought him. In the course of his search along the beach, accompanied by his faithful dog, he discovered a mass of human beings huddled together on a ledge of rocks, some distance from the land, deep water intervening, with a heavy sea in which no boat could live. He lost no time in alarming his neighbors, who soon mustered in force, and held a *council of war* as to the means to be adopted to save the unfortunates from certain death, as unless speedily rescued they must perish from cold and starvation. The dog was fortunately thought of; hawsers and cod lines were speedily procured—the latter to fasten around the dog's neck. The sagacious animal fully understood his master's wishes, and, after great difficulty, he reached the rocks, and was soon relieved of the cod-line, which being fastened to a small rope, and that again to a stout hawser, which the shipwrecked men hauled across the channel, a safe means of communication was speedily established, and seventy-five men, women and children, rescued from certain death. The vessel had struck, towards morning, on the outside of the ledge, when the tide was falling, hence the safety of those who escaped; but had they not been rescued in time, the greater part would probably have been washed off as the tide rose. A great number of persons perished, but I cannot, after the lapse of so many years, remember all the particulars.

A son of one of the partners in the great Newfoundland house of Brooking & Co., related what I have stated above, he having, with much difficulty, become the owner of the dog Hero; that I think was the name. He offered five pounds at first; and finally fifteen bright sovereigns, equal to seventy-five dollars, tempted the fisherman to part with his dog, a splendid animal, and a great favorite with his new master, who would not have parted with him for ten times the amount he paid.

I once knew a farmer, who being a great sportsman, succeeded in training a Newfoundland dog to hunt as well as his spaniel, which was an excellent sporting dog. I also remember a friend of mine in Southampton, England, having one who was trained to go to the baker's every morning for hot rolls for breakfast. They were a numerous family, and often had friends staying there, consequently the number required varied occasionally. The servant would count the pence before the dog, place them in the basket with the napkins, and give it to Hector, who proceeded to the baker's, and watched the number of rolls given as carefully as the servant would have done. The baker often put one less to test the dog's sagacity, but in vain; he would growl and refuse to take the basket until he had the right number. This he did for many years.

In the summer of 1840, I went from London to Perry Grove, in the Forest of Dean, to see Carlo's mistress, who was seriously ill. I traveled by the then favorite and fast coach Quicksilver, occupying, as I always did, the much coveted box-seat, which was by the side of the coachman, who always liked that seat to be occupied by one who had some knowledge of driving. On nearing the village of Maidenhead, my friend *coachy* requested me to hold the ribbons—reins—while he got a private letter bag ready for delivery. And now, sir, said the Knight of the Whip, "just notice to whom I deliver this bag." A short distance further I saw a large Newfoundland dog quietly awaiting our arrival. Without stopping, or even checking our speed, the bag was thrown to the dog, who seized it at once, and darted off along a cross country road. Our driver then informed me that the owner of the dog was a large landed proprietor, whose estate was situated about three miles off the high road, and that the animal was trained when young to meet the coach, which he had never failed to do for several years, thus saving the time of a servant. The bag contained the London morning papers, etc., which, if sent by mail, would only be received the following day.

The driver of the Quicksilver, whose name I have forgotten, had been a guard in his younger days on the Portsmouth road, and related numerous anecdotes of men-of-wars-men traveling to London from and to the great naval depot, the following among the number.

On one occasion, after the close of the French war, Admiral Digby was the only inside passenger for London, but the coach had its full compliment outside—a Warrant Officer among the number, who had just returned from a foreign station—a very respectable and well behaved man. He was very sleepy, and the guard feared he would fall off, or, as Jack expresses it, overboard. He, therefore, told him that the landlord of the next inn at which they stopped was one of the proprietors of the coach, and a very kind, good-hearted man. He would, therefore, advise him to ask the landlord to join in a glass of brandy and water, and then request that he would tell the coach man to put him inside. The plan succeeded, and the Warrant Officer, taking his seat opposite the Admiral, soon fell into a sound sleep, and snored most lustily to the great annoyance of his superior officer, who finally put his head out of the window, calling on *coachy* to stop. He then remonstrated with both guard and driver, stating that a man who did not pay inside fare had no business there. The coachman told the Admiral he had followed orders, the man not having been placed there on his own responsibility. But in vain the Admiral insisted on his returning to his outside seat, and no wonder, as his nasal powers were, to use our informants own words, "more like a fog horn than anything he had ever heard in the snoring line!" The Warrant Officer returned to the outside, but had his revenge. The Admiral had stated that he could not sleep on account of his fellow travelers snoring, and the latter hit upon a plan quite as effective to keep him awake. Instead of resuming his seat he got on the roof of the coach, and seating himself on the luggage he began to hum a tune, and beat time on the roof with his walking cane. This soon awoke the Admiral, who again popped his head out to call on him to desist. "Keep inside, sir! You have not paid for an outside berth," with a gentle pat on the head with his cane, was the ready rejoinder, and in this way he tormented his superior officer during the rest of the night, no remonstrance on the part of the guard and coachman having the slightest effect. "If I must keep watch on deck, he shall keep watch in the cabin!" was his reply. Being a dark night, Admiral Digby had no opportunity of ascertaining who his persecutor was, as the Warrant Officer left the coach in the outskirts of London. Arrived at the Spread Eagle, Grace Church street, the Admiral proceeded to the coach office to complain to Mr. Edwards, the landlord, who was also one of the coach proprietors. Both guard and coachman were summoned, and severely admonished—even threatened with dismissal—their previous good character alone saving them.

I was personally acquainted with the Admiral as well as Mr. Edwards, and had therefore an opportunity of ascertaining that the facts, as related to me, were correct. I may, at some future period, relate another anecdote, which I had from the lips of the former. PHILIP VIBERT.

Perce, December 10th, 1876.

[To be continued.]

THE KENNEL REGISTER.—We mentioned in our "Answers to Correspondents" recently that pedigrees for the first volume of the Kennel Stud Book would only be received for a fortnight longer. That announcement was rather premature as we find that while preparing those now in hand others can be received and classified up to a short time before the book goes to press. Owners of stud dogs of acknowledged merit can have the portraits of their dogs inserted in the book to face the bracketed pedigree at no expense beyond the cost of the cut.

FOREST CITY KENNEL.—We had the pleasure last week of a visit from Mr. W. J. Farrar, of Cleveland, proprietor of the above kennel, who informs us that the well known dogs purchased by him from Dr. Goldsmith, of Vermont, are all in excellent health and condition. Carrie visited Plunket on the 30th of January. Nell was served by him on February 13th. Mr. W. H. Wedsdale's (of Birmingham, O.,) bitch has also been served by Plunket.

DOG POISONING.—The dog poisoners are around again. Many valuable animals have recently been destroyed in the vicinity of Ridgewood, Bloomfield, and Montclair, in New Jersey. The mischief is not perpetrated on any one class of dogs, and is attributed to "pure cussedness" on the part of some one.

—Mr. C. S. Keller, of Washington, D. C,, writes us that his setter bitch Mollie, whelped on Sunday, the 25th ulto., seven puppies to Gen. Beale's imported red Irish setter Rock, four dogs and three bitches, and he claims the following names for four of them, viz Ponce Maria, Huron, Hector, Danny Man, all fawn and white.

DISTEMPER IN MARYLAND.—Mr. Chas. E. Coffin, in a letter from Muirkirk, Prince Georges county, dated March 4th, says:—

"Distemper seems to be very fatal all over the county. My white and orange setter pup Snow, bred by Mr. W. Jones, Wilmington, Del., died of it about ten days ago. Mr. Odiorne's pointer bithes Snap and Ginger each lost a litter of pups from it, or the extreme cold, in January, and last week his black pointer bitch Snap died from the effects of distemper. She was bred by me, being out of my black bitch Meg, and was a fine dog in the field. So far the litter of orange and white pups are coming on nicely, and we hope that they will escape the disease."

—Mr. H. B. Northcott's black and tan bitch Wrag, has visited Rapp at the Forest City Kennel, Cleveland, O.

BEGORRAH.

Mr. Dieffenderffer's lless. | Plunket.

Dr. Strachan's Belle, Imported from the Duke of Devonshire's kennel. | Saltus' Dash. | Macdona's Grouse. | Hon. D. Plunket's Beauty.

Saltus' Duck. | Hinckle's Dog. | Saltus' Frisk. | Palmer's Belle. | Robinson's Jack. | Putnam's Dan. | Lucy. | Birtwhistle's Tim. | Hutchinson's Bob. | Quail. | Hebe. | Dash. | Birtwhistle's Tim. | Nora. | Hon. D. Plunket's Rover.

Begorrah is a red and white Irish setter dog, born May, 1876. Bred by Mr. Nicholas Saltus, Brooklyn. Owned by Mr. P. Noel, New York. He is a deep red and white on breast and foot; his head is narrow, winden ing in the forehead; his ears a good length, well set on back of the head; eyes, black; nose, black; chest very deep; strong loins, well bent; stern carried slightly up; coat rather harsh and thick.

COUNTESS.—Mr. Dilley writes us from Lake City, Min., on Feb. 26th, 1877, as follows:—

"Mr. R. H. Gillespie having shown prior claim to the name of Countess, I cheerfully surrender my right to it, and my apology to him for making the claim is that my bitch was whelped and named in February, 1876; that I had not noticed his claim in the Chicago *Field* of the date November 4th, 1876. Although I did not make claim until December 30th, I now claim instead for her, the name of "Minnesota." Please make the necessary alteration in your Kennel Register, 'Saum cuique.'" S. B. Dilley.

—Mr. Chas. Riley, of Albany, N. Y., claims the name of Rip for his red Irish setter whelped in July, 1876, and got by Tuckerman's Don out of Gibson's Pearl.

—Our cut this week is an excellent portrait of Mr. Noel's fine red dog Begorrah by Plunket.

—A fine Newfoundland dog is advertised for sale in another column.

—Mr. C. L. Austin's (of Boston) black pointer bitch Belle recently whelped *fourteen* puppies by the Westminster Kennel Club's dog Sensation. Unfortunately the bitch whelped a few days before her time and the puppies not having their natural nourishment all died. In color they were lemon and white, black, and liver and white. This raises the question whether a cross between a lemon and white dog and a black bitch will produce puppies of *natural* (*i. e.* not transmitted) liver color.

—A harrier bitch is advertised for sale in another column. For the edification of the uninitiated we would say that the harrier is a species of hound, in point of size between the fox-hound and the beagle.

Sea and River Fishing.

FISH IN SEASON IN MARCH.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family *Sciænidæ*. Trout (black bass) *Centropristis atrarius*.
Kingfish, *Menticirrus nebulosus*. Striped bass or Rockfish, *Roccus lineatus*.
Sea Bass, *Scienops ocellatus*.
Sheepshead, *Archosargus probatocephalus*. Tautorfish, *Pomatomus saltatrix*.
Black Bass, *Micropterus salmoides*; *M. nigricans*.
Snapper, *Lutjanus caxys*.

FISH IN MARKET.—Our fish market continues to be abundantly supplied, and good church people who adhere tenaciously to the customs of Lent can find no fault either with variety or prices. We quote:—Striped bass 18 to 25 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen), 30 cents; shad (southern), 50 cents each; mackerel, 30 cents; white perch, 15 cents; Spanish mackerel 55 cents; green turtle, 20 cents; terrapin, $15 per dozen; frostfish, 7 cents per pound; halibut, 15 cents; haddock, 7 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 18 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 15 cents; turbott, 18 cents; scollops, $1.50 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; sunfish, 10 cents; yellow perch, 6 cents; salmon trout, 15 cents; hard shell crabs, $4.00 per 100.

—The moderate weather has set to work the Chesapeake fishermen in preparing their seines and repairing their boats, in anticipation of an early run of herring up the Susquehanna, which sometimes begins in March.

—Now is the time to impale the toothsome (?) sucker as he *buds* upon the willows and alders which skirt the river's bank.

ARTIFICIAL FLIES.—We beg to refer any of our readers who wish to learn the art of dressing artificial flies, to a very competent instructor, Mr. John Haily, 320 Henry street, this city, (see advertisement elsewhere). Mr. Haily has often been summoned to places far distant by person who had heard of his skill, and wished to avail themselves thereof.

VERMONT—*Ferrisburgh*.—March has come in like a lamb, and is inaugurated by a perfect spring day. Our four feet of snow are dwindling perceptibly, and the sleighing is almost gone. We are anxiously waiting for spring fishing. R. R. M.

NEW YORK—*Lake George, Warren Co.*—The fishing at this season of the year is good. The kinds taken now, are confined by law, (which law is often trespassed upon) to perch, pickerel, and a few other kinds that now and then take the bait used. On the 1st of March this law will permit the taking of all kinds. There will be hundreds of pounds taken daily while the ice lasts. I have taken, by being out before sun rise in the morning, and just at sun set, since the 31st day of January, 64 dozen of perch. These fish are the finest flavored fish that swims. On pleasant days the grounds frequented by these fish are dotted with people sitting over the holes cut in the ice.

E. S. H.

MOVEMENTS OF THE FISHING FLEET.—The Georges fleet are a week or ten days later in returning from their first trips than last year, and although they have had excellent weather for fishing, bring in small fares. Forty four arrivals have been reported the past week, landing about 1,000,000 pounds codfish and 130,000 pounds halibut. The old stock of Georges fish are nearly closed out, and the prospect is that there will be a good call for new as soon as in marketable condition, though buyers anticipate a slight decline in price. The Grand Bank arrivals for the week number three, bringing 190,000 pounds halibut, and five herring cargoes have been received from Newfoundland and four from Grand Menan. Total number of fishing arrivals for the week fifty-six. The shore fishermen have met with moderate success, and fair prices have been realized for their catch.—*Cape Ann Advertiser, March 2d.*

CHUB FISHING IN VIRGINIA

EDITOR FOREST AND STREAM:—

I have a controversy with a very dear friend, involving a question of sportmanship. I think I am right, and he is wrong; but he heeds not my logic, and, therefore, I appeal the case to the Supreme Tribunal of FOREST AND STREAM.

Here is my brief:

May it please Your Honors, the delinquent in this case is instinct in every fibre of his body and every emotion of his soul with the true spirit of a genuine sportsman. More the pity and the greater the penalty; but the object of this complaint is not punishment, but reformation.

In tide-water Virginia, there are a great many millponds, in many cases covering hundreds of acres of land, fed by small streams, which flow through level and sandy districts, therefore rarely riled, and consequently are favorite and favorable habitats for the finney tribe. The southern chub (*Grysles Nigricans*) of the Smithsonian Institution and Oswego bass of Seth Green, is the predominant fish of these waters, where it is very numerous, and frequently attains the weight of ten to twelve pounds This fish is esteemed by the natives as among the best they have for the table. This fact, no doubt, the delinquent will urge in extenuation of his fault. He asserts, that the streak of fat and streak of lean, which pervade the body of this fish, constitute it a morsel more delicious than any ever tasted by the Olympian Deities—especially when condimented and roasted by his artistic hand.

It is the habit of the native anglers to cut large trees into the ponds—around and in which the chub are wont to congregate—in part from the habit they have in common with hogs, of rubbing against logs, and in part for protection—a colgn of vantage—to which they retreat in case of danger, for they are foul fighters, and as soon as they feel the steel will strike below the belt, or resort to any ungamely device for deliverance and safety. Consequently, only very strong tackle is adequate to their capture. This usually consists of a rod, stiff as a fence-rail, and as tough as a white-oak withe, a line as strong as a plough-line, and a hook made of the link of a log-chain. With this outfit, the natives—and in this category none is a grosser offender than the delinquent at the bar—takes a small boat, creeps cautiously along to the felled trees, and with a large float and heavy sinkers, strives to insinuate his hook with a live five-inch dace on it, between the limbs and brush of the fallen tree. If the minnow goes down and is not speedily struck by a fish, it quickly raps itself and the line around a limb, and then there is the deil to pay with a hung hook. If the chub strikes the bait there comes a pure contest of physical force between the beast in the water and the man in the boat as to which shall dislodge the other. And this, we are told, is sport.

But if the question of sport be thrown aside altogether, and *pot* only considered, there might be some possible excuse for this barbarous procedure, for I have snuffed the savors of that famous dish *a la mode King William*, and can bear cheerful testimony to its appetizing properties. But the *pot* has its limits, which are easily defined and understood.

And then, too, there might be some palliation, if this region afforded no other sport for the rod. But just here, we meet the intensest aggravation of the enormity of this offender. His own residence is midway the narrowest point of a narrow peninsula, between two fine streams for rock or striped bass, and from the top of his house Seth Green could cast a fly into either river. And what is more, his own land runs down to and into one of them, embracing a magnificent sweep of that majestic water, and including a sand-bar, where, this delinquent himself confesses, the rock delight to school, till murdered by nets or trot-lines. And yet this professed sportsman never yet experienced the rapture of a rod and reel, with a twenty pound bass at the end of his line! Oh! judge, be merciful in your judgment!

But even this is not all, bad as it is. If there were no rock or bass in the waters at his door, you have only to take the map of Virginia and see what streams are within his reach. From the Potomac to the James—a distance of not more than forty miles as the crow flies—there is a succession of narrow peninsulas, hugged by lovely tidal streams, resplendent with striped bass. First, the "northern neck" between the Potomac and Rappahannock. Next, the still narrower peninsula between the Rappahannock and the Piarkitank; then the tributaries of Mob Jack Bay and the rivers of Glocester—all mere arms of the Chesapeake—abounding in fish, and especially the rock bass, as game as the Salmo-Salar itself. Next comes the historical peninsula of the York and the James—two oceanic streams—and all within half a day's ride of this terrible delinquent, who fancies he can pass with the world as an artistic angler by never tackling a rock, but prowling around mill ponds, and from the midst of logs and brush dragging out the lubberly chub by main force. Dispense justice with mercy, O judge! PISCATOR.

[JUDGMENT OF THE COURT.]

The Court confesses its astonishment at hearing that any person, calling himself a sportsman, and being within reach of striped bass or rock, never knew the exquisite delight of capturing one of those gamest of fish with rod and reel. There must be some mistake in this allegation, and in the full confidence of a satisfactory eclaircissement, the Court will await the response of the defendant.

As to the alleged mode of capturing chub, that of course cannot be reconciled to any of the laws and usages known to artistic anglers. It can be only considered in reference to "pot:" and how far its merits in that respect may excuse a departure from the strict letter of the law, is a matter worthy of calm inquiry and grave consideration. The Court does not hesitate to own to a weakness for "pot." The Court therefore contents itself for the present with an

INTERLOCUTORY DECREE.

In the words and figures following, to wit:

Ordered and decreed that the defendant, in this case, shall on the 1st day of April next, meet the Court and the complainant at Sweet Hall Station, York River Railroad, King William county, Virginia; thence repair to Lee's mill pond, and then and there in the view of the Court capture at least three chub, weighing seven pounds each, and forthwith proceed to condiment and cook said fish *a la mode King William*, in order that all the senses of the Court may be fully and duly illuminated as to the vaunted virtues of this much mooted dish.—*Ilicet!*]

New Publications.

LAWS AND PRACTICE OF EUCHRE.

We have received from the publishers, Messrs. T. B. Peterson & Co., Philadelphia, a neat little volume with the above title, and which contains in addition "The Laws and Rules for Playing Draw Poker." It is comprehensive and compact, and will prove a handy book of reference in cases of disputed points.

THE TEXT-BOOK OF MINERALOGY. By Professor E. S. Dana, of New Haven.

ROTHERHAM'S CRITICALLY EMPHASIZED NEW TESTAMENT. A new and revised edition, prepared by Bagster & Sons.

GRAPHICAL STATICS. By Professor A. Jay Du Bois, of Lehigh University.

THEORY OF TRANSVERSE STRAINS AND THEIR APPLICATION TO ROOFS AND TRUSSES. By R. G. Hatfield, author of "American House Carpenter." New York. John Wiley & Sons.

The above works are all now in press and will appear in the course of the present month. Professor Dana's Text-book will, it is thought, completely cover the field of investigation in mineralogy, without going into minute details. The author takes a very extended view of his subject, and enters into the latest discoveries, comprising Determinative Mineralogy and Crystallography. The latter is treated more in detail than any of the others. The author's design is to lay before students the guiding principles of the science and the most recent additions to it, and thus to furnish a guide to thorough and independent research. The work will be an octavo of almost five hundred pages, and will contain eight hundred wood cuts and a colored plate. It will be published at $5.

Bagster's Rotherham is designed to clear up obscure passages, and will be of great value to theologians and students.

The first edition of Professor Du Bois' "Graphical Statics" having been adopted by most of the leading scientific schools, the new edition will probably be in more greater demand. The same author has now in preparation a translation from the second volume of Weisbath's Engineering of the Theory of Hydraulics, Hydraulic Motors, and the steam engine, intended as a text book and companion to Mr. Coxe's able translation from the first volume.

Mr. Hatfield's work will contain new tables of strains and resistance of material, and is designed to assist the non-professional architect and student. The author thinks that in these days of accident and disaster, a thorough understanding of the subject of which he treats cannot be too strongly insisted on.

The Messrs. Wiley's also publish the works of John Ruskin, which may be had either in sets or separately. They are in three styles, in cloth in cloths with plates, and half calf with plates. We have before us his "Mornings in Florence," a book which fairly illustrates the trenchant style and deep insight of the great English critic and lecturer. It is said by the author to contain "simple studies of christain art for English travelers," but will be read with profit by the travelers of all lands, for the sake of the lessons it teaches in regard to the value of traveling with one's eyes open.

FRIEND FRITZ. A tale of the banks of the Lanter. Translated from the French of Erckmann-Chatrian. New York. Scribner, Armstrong & Co:

"Friend Fritz" is a very pleasing addition to the many interesting volumes which American readers owe to the joint authorship of Messrs. Erckmann & Chatrian. The plot is not strikingly novel, and is very simple, but the tale is told with all the vivacity and gracefulness which have characterized the author's previous works. An apparently incorrigible bachelor of thirty-six is no uncommon phenemenon in the world, and such an one was Fritz Kobus, the hero of the story. The authors have devoted themselves to unfolding the manner and circumstances of his conversion through the instrumentality of a certain charming little Suzel. The character of Fritz is strongly drawn. He is represented as a rich, sunny-natured bachelor, fond of comfort and warm hearted, and delighting in his freedom. Being a good match" he moved warily where the fair sex was concerned, but the astute detector of the schemes of the artful, at last fell into the snares of artlessness. The minor characters are equally well drawn and skilfully managed. The humor of the story is abundant and racy. Some of the scenes are depicted with exceptional vividness and evident fidelity. We may refer particularly to the *fete* at Bischeno, and the inn in Wildland. "The College Life of Maitre Fablot" is continued in the same volume.

MAGAZINES.

The *American Agriculturist* for March covers a great variety of interesting topics. This publication is undoubtedly the best of its kind in the country, and there is none that we read with more interest and congeniality of feeling. Were we not publishers of FOREST AND STREAM we should be proud to be publishers of the *Agriculturist*. [No disparagement meant.]

In looking over a periodical which contains so much that is interesting as does the *Popular Science Monthly* for March, it is a task somewhat embarrassing to select the articles to be particularly referred to. Had we space in these columns we should like to reproduce for the benefit of such readers of FOREST AND STREAM as do not see the *Monthly*, Dr. Bain's interesting paper on Education as a Science; the story of How the Earth was regarded in Old Times, and the abstract of Judge Daley's address to the Geographical Society. We should be glad too to give an analysis of Prof. Grote's valuable lecture on The Early Man of North America, and to relate the struggles and hardships of that true laborer in the field of science, Thomas Edward, the Scotchman. But for all these choice things our readers must go to the magazine.

Perhaps the article of the most practical importance in this number of the *Monthly* is Prof. Huxley's lecture, entitled "The Study of Biology." No one is better fitted to speak on this subject than this great teacher, and his advice will be heard and accepted wherever this study is valued at its true worth.

The correspondence in the present number is unusually extended, and the Miscellany varied and attractive. In the Editors Table, Prof. Youman's answers quite fully and forcibly Dr. Deems, who propounds a number of conundrums bearing on the evolution question.

—The Hon. Smith Wright, of Williston, Vt., is fattening for market 8,000 head of poultry, to which he is feeding seventy-five bushels of grain. Of the above number 3,800 are geese, 2,800 are turkeys, and 1,400 are ducks.

WHAT THE WIFE OF AN EDITOR NAMED HER LAST TWINS:—Adaline and Addenda.

—The livid, dark crimson spots, sometimes called "port-wine marks," with which some persons' faces are naturally disfigured, have generally been regarded as indelible. The surgeon of the London hospital has performed several successful operations, however, and he describes them for the benefit of his profession. He makes clean-cut, parallel incisions over the affected surface, about a sixteenth of an inch apart, after making the flesh insensible with ether spray. Upon healing, the blemish is gone, and no scars are left if the operation has been carefully done.—*Ex.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Rational Pastimes.

BASE BALL.

Philadelphia's representative Club has been reorganized as a stock company, under the title of the Athletic Association, and officered as follows: President, Charles H. Downing; Vice-Presidents, S. M. Flanagan and William Warnock; Treasurer, George W. Thompson; Secretary, Charles I. Cragin; Directors, Frank Mills and Charles I. Cragin; Scorer, Alfred H. Wright, and Manager, E. Hicks Hayhurst. They will play as an independent organization with the following team: McBride and Weaver as the pitcher; Bennett and Coons as the catcher and change-catcher; Fisher, Reach and Meyerle as the three base men; Fulmer short-stop, and Sensenderfer, center-field. Ryan, of the Louisvilles, in case he can get a honorable release from said organization, will be the left-fielder, and the right-fielder will be either the change-pitcher or change-catcher, as circumstances may deem best. They will play all reputable Clubs, using the old ground at Twenty-fifth and Jefferson streets, Philadelphia, and charging twenty-five cents admission. The players above named, with one exception, are Philadelphians, six being of the Old Champion Nine, and being above suspicion, they are thoroughly worthy of the cordial and hearty support of the lovers of the national game in Philadelphia.

—Play was opened for 1877 at Prospect Park, on March 1st, the weather being fair, but the ground was slippery. There was a large number of professionals present, and a good game was played. Matthews and Hallinan, of the Cincinnatis; Bond, of the Bostons, and Cassidy and Larkin, of the Hartfords, were the only League men who took part in the game, all the others being either international or League Alliance players. Knodell, of the Tecumsehs, of Canada, caught for Larkin, and did the business in fine style, having but two errors charged against him during the game. With such men as Matthews, Hallinan, Bowie, of the Eries; Quinn, of the Tilons; McCabe and Hourigan, of the Chelseas, and Bunce, of the Nassaus, to support him, it is not surprising that Larkin's pitching was so effective. On the other side, Callahan and Barrie, of the Buckeyes, pitched and caught, and as they were used to each other's style of playing, they fitted together like clockwork. The side supporting Callahan's pitching was won by 3 to 2 in nine innings.

—The Bostons had a good game on Washington's birthday.

—The Indianapolis Club started on a tour south on March 3d.

—The International Base Ball Association sprang into existence on the night of February 20th, at a Convention of professional club delegates held at Pittsburgh at that date. Professional organizations from New York, New Jersey, Massachusetts, Pennsylvania, Ohio, Illinois, Missouri, California and Canada, were represented, and an organization was effected well calculated to reduce the list of cracked players and revolvers which have infected the professional class of late years. The new Association modeled their constitution upon that of the League, and adopted the playing code of rules of the League, which makes one code applicable to every club in the country as far as the mere rules of play are concerned. The Convention adopted a dead ball, and fixed the price of admission to their matches at twenty-five cents. The officers selected were: W. A. Cummings, Lynn, Massachusetts, of last year's Hartfords, President; H. Gorman, London, Canada, Vice-President; J. A. Williams, Columbus, Ohio, Treasurer and Secretary. The Judiciary Committee is composed as follows: H. D. McKnight, of Pittsburg; L. C. Waite, St. Louis; N. P. Pond, Rochester, New York; A. B. Rankin, Brooklyn; and George Sleeman, of Guelph, Ontario.

The Convention, after disposing of all its business, adjourned to meet at the Palmer House, Chicago, February 3d, 1878.

—The ball players of California now have a professional organization to represent them in the championship arena, in the new San Francisco Base Ball Association, the officers of which are as follows: President, L. N. David; Vice-President, John Williams; Corresponding Secretary, C. J. Keating; Recording Secretary, L. E. Delevan; Treasurer, W. H. Williams; Board of Directors, E. Taylor, W. H. Williams and J. Williams; Delegates to the International Convention, L. N. David, E. Taylor and C. J. Keating.

—The Amateur National Association held their annual meeting in this city on March 14th. As only legitimate amateur clubs will be recognized, the attendance of delegates bid fair to be limited.

—The Athletic nine for 1877 bids fair to be a strong team. It is to include Bennett, c, McBride, p, Fisler, 1 b, Williamson, 2 b, Meyerle, 3 b, Fulmer, s s, Coons, l f, Reach, c f, Weaver, r f.

The Kennel.

FOREST CITY KENNEL

Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own.

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
C.W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP. DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT:

BREAST MEASURE.
WAIST MEASURE.
INSIDE SEAM COAT SLEEVE.
INSIDE SEAM PANTALOONS.

A VICTORIOUS INVENTION.

The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation.

It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape.

It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

PRICE LIST:

No. 1—For fishing and all kinds of small game and animals sent by mail..... 35 cents
No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, &c..... 50 cents
No 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, &c. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight 10 to 15 lbs. $10

All goods sent charges paid to any address on receipt of price. Adress

LYMAN'S PATENT
BOW-FACING ROWING GEAR

A Revolution in Boating.

With this rowing gear the oarsman faces forward instead of backward, pulling in the same manner as with ordinary oars. The stroke is longer and much easier than with any other oar. The boatman makes no more effort in steering than in directing his course while walking. The oars can be shipped instantly by closing them upon the gunwale of boat or entirely detaching them. This oar is especially adapted to all kinds of pleasure boating, and is indispensible in duck shooting.

ADIRONDACK GUIDE.

BY E. R. WALLACE.

Gives all possible information relative to Routes, Hotels, Resorts, Outfits, Guides, Distances, &c., with amended railway schedules, &c.

The Only Complete Guide to the North Woods.

The instructions embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—*Hon. J. T. Headley.*

I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.—*Benson J. Lossing.*

It is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for.—*Alfred B. Street,* Author of "Woods and Waters."

Paints,

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)

MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PUROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition

therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. SCALED OR WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE On

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

COGINCHAUG*.

SPARKLING, rippling, glancing along,
Hiding thy face the sweet grasses among,
Foaming o'er pebbles halting thy sweep
In darkling pellucidness softly to sleep,
Parling through meadows, 'mid alder and bog—
What are thy treasures? O fair Coginchaug!
Dost bid me reveal them? Alack thou'rt unkind,
Thou ever wer't fickle and mem'ry dost mind
That tho' thou hast jewels resplendent and rare,
Thou giv'st them not forth to all who would dare.
Yet fain would I test thee thou miserly elf,
And pluck from thy bosom such portion of pelf
As well would bedeck me, yet leave in thy store
Enough—and enough is plenty, no more.
So will I try thee, and thou, placid pool,
Yield me first answer in depths clear and cool.
Dost trifle? Pray where from thy matchless parure
Such a bubble did'st pluck; a rare Kohinoor
Thou'st sent to my cast in you sad-eyed lout,
Bespeckled? I grant thee; belegged all about,
With a house on his back and a sneer on his face,
Bewrinkled and sallow, bereft of all grace,
A beggar in armor—but ne'er with the myrtle
Dost thou crown as King the vagabond turtle!
Tauntingly ripples thy current along,
Telling the birches in thy song,
Whisp'ring low to chestnut and pine,
Bathing the fallen oak tree's chine;
O mocking river well dost thou prove
Faithful to treasures thou truly dost love.
Yet will I try thee with more patient skill
Nor minnow nor red-fin can conquer the will
Thou testest so sorely; each obstacle bends
But more strongly intent thou makest amends.
I know that the years since thou last met my eyes
Have robbed thee of many a coveted prize;
Have taken perchance all thy gold, and in place
Left nothing but farthing like turtles and dace;
Bethink me, you low-bending willow, whose crest
Dost dip thee a curt'sy more deep than the rest,
Whose roots and whose brow thou dost softly embrace,
Whose leaflets thou waltzed away in a race
As merry as shallops a-sailing the sea,
But grim, grizzled warder of thine may'st be!
Curve thee thy supple arms closer to hide
Th' embubbled depths thou hast made thy bride;
Bravely O willow! thou seek'st to ensnare
My bonny brown hackle so dainty and rare;
Gently it floats on thy bosom, O stream!
Softly—a rush, and a dart, and a gleam,
One moment of spectrum-like hues all attain,
A tug which electrifies sinew and brain;
A whirr from the drowsing reel awakened from sleep,
Ha, ha! I have hooked thee from out the dim keep
Where thou hid'st thy royalty sternly apart;
Sob on thou stream! for thy very heart
Doth seem to be pulsing along the staunch line,
The supple rod answering each throb of thine.
Quivering and beautiful, crimson and gold,
Like molten silver thou yieldest thy hold
From the cool sparkling waters, and gently dost lie
Exhausted at last 'mid the daisies, to die.
Moaning, weeping, sighing along,
Hiding thy face the sweet grasses among,
Fragrant spring violets drinking thy tears,
Clover and maiden-hair soothing thy fears,
Wearied thou sinkest to sleep 'neath yon log,
And I have thy treasured, O fair Coginchaug!

New York, Feb. 15th, 1877. WEDWORTH WADSWORTH.

*Coginchaug, the Indian name of a famous trout stream in Middlesex Co., Connecticut.

Bird Shooting in Mississippi.

For Forest and Stream.

WE commenced the new year on a clean page. The snow lay white and untrodden as far as the eye could reach—a shroud for the old year, a robe for the new. In fact, there were four snows on the ground at once, the accumulated depth being full fourteen inches. This is the deepest snow-fall, in this region, within the memory of the oldest inhabitant—or any other man. As we can't find the way to the north pole, it is working its way towards us. Sleighs were improvised, and for the first time the merry bells were heard in Corinthian streets. While it brought gladness to the hearts of the girls and boys, it saddened the sportsman's heart to see the destruction wrought on all kinds of game. Quails were trapped by the hundred, and were tracked up in the snow, and shot huddled together in fence corners and by the sides of logs, by the merciless pot-hunters. Their accustomed food was buried so deeply that they could not reach it, and many perished from starvation. How any survived, through three weeks of cold and hunger, only He knows who cares for the young raven.

We had the prospect for the best year for quail shooting since 1870; but about the middle of December the weather suddenly grew extremely cold, and at Christmas the snow commenced falling, and has just now disappeared; the birds are so poor that they can scarcely fly, and it would be murder in the first degree to shoot them. But we have had some glorious days in the field, for which we thank the good Saint Hubert. Of one of these days I shall tell you. My friend W. and I started early with Don, Kate and Lou, old Nora having maternal duties to attend to could not go.

It was just such a day as you would choose to go to a field. A light rain had fallen the evening before, followed by a clear night and a glorious sunrise. It was not so cold as to keep the birds from stirring early; the air was damp enough to hold the scent, and there was a ghost of a breeze, just sufficient to carry it to the dogs noses. How gayly they romped and gamboled until we got to the first field, and they settled down to work. W. took one side with Lou; I the other with the pointers. "Hie away good dogs," and over the fence they go, while I ride along outside. The field was full of peas, and two full coveys raised in it. As Kate was going at full speed across the rows she got the wind from a covey turned at a right angle from her course, galloped slowly a few yards, came down to a crouching trot, and I then stopped rigid and motionless. Don saw and backed her. Dismounting, I approached them from the side next the wood, in order to make the birds fly in the opposite direction; but they were too sharp for that. When I got to within twenty yards they rose in a bunch, and came square at me. I fired "into the brown of 'em" as they came on, and never touched a bird; one rose high on the right. I tried to follow and cover him, but he swerved swiftly to the right, and I missed him full two feet. They went down in the woods among the black jack saplings, where only Jeem's, the pious, could have made any headway shooting them. After shooting off brush enough to make a small fire without killing a bird, I blew my whistle and retired in disgust. Meanwhile W. had struck a covey at the other side of the field, and was skirmishing away quite lively, and when we met he had bagged six birds. "How many have you got?" he asked. "Narry quail." "What the deuce were you shooting at then?" "My dear boy, I have got so rattled that I could not hit an elephant with a *mitrailevse*." "You had better go home then." "You be hanged, if I don't beat you to-day I'll pay for the champagne." The next field, we went in a-foot, and passed through without finding a bird. Just outside the dogs all came to a stand. We went up, and the birds rose; four or five crowded together in flying through a hole in the hedge. I cut away at the bunch, and I dropped two; turned and winged another with the other barrel. Part of the covey rising high, flew back over W.; he put in both barrels without getting a bird.

W. went back into the field after part of the covey, and I followed those that went down in the wood; they lay well in the leaves, and I got two more. A man in a field beyond, called to me, that he had flushed a large covey that went into a swale near by; there in the thick grass they lay like stones, and seven more were added to my bag. I made three consecutive double shots, bagging both birds each time. One that was winged got away, and one I missed—a plain shot—by being to confident, and consequently careless. W. bagged three from the part of the covey he followed. The dogs worked well together on coveys—but did not do so well on single birds—so we shot apart as much as possible. At the next field the setter ran two close on a covey and flushed. W., wishing to mark them down, ran at top speed to see them over a hill; while going at a two-twenty gait his foot was caught in a forked limb, and he got the highest, longest, and hardest fall on record. His gun went boomeranging ahead of him, and a hat full of shells were dumped from his rear pocket.

Now, W., is a sort of pious man, and reads the Bible before Balzac and Boccaccio, but when he rose up and saw me leaning against a tree to keep from falling, and ready to burst with suppressed laughter, he indulged in some remarks that may have been what some fellows calls "Nervous Saxon," but it sounded to me powerfully "cussin'." This covey took refuge in a four-acre briar patch, and we did not score a bird.

The next field was a famous place for quail, and we had gone but a short distance into it, the dogs all going close together at top speed. All at once they were struck stiff by

"A potent gale, delicious as the breath
Of maid, to the love-sick shepperdess
On violets diffused, while soft she hears
Her panting shepherd stealing to her arms."

They move grouped in a manner that seems splendid, and would have made a picture worthy the canvas of any painter. We admired the graceful attitudes of the dogs a few moments, and then walked up the birds. They were "huddled," and whir-r-r-r, they flew, in every direction, like fragments of a bursting shell. One old cock—after trying to fly into my gun muzzles—rocketed square up about twenty feet, and then went off behind me, down wind, as if he had been shot from a cannon by the time I followed him up, and over and down, and straight away he was nearly out of gun shot, but I cut away at him, and the force of the shot, together with the impetus of his flight, dashed him against a tree as if he had been thrown at it. By the time I recovered and began to look around for another bird, they were all clean gone. W. got in two barrels and scored one bird. The others must have flown clear out of the township, as we saw them "never more."

It being now noon, we sat down by a brook to rest and refresh ourselves. After slaking our thirst with a drink from the brook, we took a small pull at our flask of "Melwood," and spread our lunch—some bread and pickles, hard boiled eggs, cold fowl, and a couple of cylinders of deviled ham—none of the minced abominations from a tin can with a red "Bad Man" on it, with a harpoon tail—but the genuine home-made. After satisfying our appetites, we threw the remains of the lunch to the dogs, lit our pipes, and proceeded to spread ourselves in the thick sedge-grass. As we lay there, in all the jolly *insonciance* of the true sportsman, with the bright sunlight streaming over us—our dogs at our feet—and the prospect of a glorious afternoon sport in store for us. What cared we for high taxes, or short crops, or low prices, or bankrupt notices, or returning boards or bulldozers?

But our pipes are out, and mounting we ride for the fields at Farmington. Quail love those field, full of corn and peas, and sorghum, with splendid cover all around, and soon we had three coveys scattered, and marked down in the swale, below the old grave yard—but the briars and grass are very high and dense, and the dogs are not much service except to retrieve the dead and wounded—and we have to put into service Guido's favorite single-bird dog. A number nine boot, albeit ours is not quite up to his standard in point of size. However, we made it hot for Robert for a while, and secured a fair average of shots. We had about exhausted the birds, and I was standing waist deep in the grass, looking at the tall oaks above the old grave yards, thinking of the time when I had heard the shot and shell hissing over them when Blue and Gray met here in fratricidal conflict. My musings were cut short by "Mark Crane," from W. Now I will not say that he don't know a "Heron from a Hernshaw," but I will say that he did not know a heron from a crane—for it was a heron—and he came slowly flying on high in air, his broad wings lazily flapping, and his long bill standing out in front like the bowsprit of a schooner. He was coming directly over me, and I concluded to try and rattle a few shot against his wings. Drawing ahead of him I fired; he veered off slightly, and went on without altering his motions in the least. He flew on a hundred yards, wavered, beat the air rapidly, then bending down his wings, holding them perfectly rigid, he sailed slowly on lower and lower, and came to the ground three hundred yards away. It was a remarkably long shot, one leg broken, and several shots in the body.

What a bright, eagle-like eye they have; what beautifully mottled wings; what a preposterously long neck and short tail, and how admirably is that long bill suited to the purpose for which it was made. This was the first dead heron I ever saw, though I have seen their breeding places—rookeries—on White river, where thousands of young were reared.

It would consume too much space to tell you of all the rest of the afternoon's sport; of how Don and Kate, coming together through an opening in the old earth works, ran up so close on a covey that the hot scent curled Kate up like a capital C, and knocked Don square on to his haunches; of how many coveys we scattered in the sedge-grass, where not a bush obstructed the hissing shot.

Just before sunset the dogs found the last covey, but it was in a rough place. The last shot I fired, an old cock got up between me and the sun. I tried to hold on him, but he looked as big as a turkey gobbler. I shot any way, and the last I saw of him he was steering like the Indian

in Hiawatha, square into the setting sun. Had I bagged him I would have tied W.

As we rode home we came to a fellow who had been into town, and had taken on a "leetle too much tangle foot;" in fact, he was so drunk that he had to hold on to the grass to keep from rolling off; his comrade appealed to us to help him get him up on his horse. At this moment Kate came up, and the more sober of the two, looking at her, said, "Well, I swear that is the pootiest hound *I* ever saw." "Hound! said the slewed fellow, "Hound!" Why, you derned mutton head, that's no hound, it's one of these *pinting setters.*" GUYON.

January, 1877.

CHRISTMAS WITH A LIFE-BOAT CREW.

L——, the sailing master of the yacht W——, having obtained the captaincy of the Life-boat station near Fire Island Light, wrote me saying they were having fine sport now on the bay, and that if I desired to join them for the holidays, he could accommodate me very comfortably.

Being fond of shooting, it may readily be imagined I was not long making up my mind to accept this tempting invitation. Accordingly, just so soon as our college duties were over, I packed up my traps, and squared away for Bay Shore, L. I., where I found L—— waiting for me at the depot as had been previously arranged.

The bay was almost entirely frozen over; but the ice, however, was barely thick enough to support the weight of a man. L—— had brought with him one of his crew, and we three were to make the passage of seven miles to the boat-house, on this unpleasantly delicate foundation. We had for our journey, one of those boats made famous by the voyage of Mr. Bishop down the Mississippi, and known to the frequenters of the bays along our coast, as the "Barnegat sneak boat." Into this little craft, I immediately deposited my gun and bundles. L—— being the lightest of the party, fastened the end of the long "painter" around his shoulders, and armed with an ice spear, took the lead, the man and myself following, holding on to the rope and dragging the boat, each carrying at the same time, an oar in case he should break through the ice. We must have looked very much like a young Arctic expedition striking out for the Pole.

After traveling for about five miles in this way, the ice began to grow so thin it would no longer bear us, and our boat breaking through, was the signal for all hands to jump in, L—— placing himself in the bow to break the passage; we were then, however, but a short distance to clear water. Finally, we reached the shore.

After entering the boat-house L—— gave me a general introduction to the crew. And here let me say, a fine set of fellows they seemed to be, looking equal to any emergency. L—— then led me to the dormitory, where he showed me my berth, neatly made up with nice white linen. As I presume all my readers have seen the model "Life-boat House" at the Centennial, I shall not attempt a description; suffice it to say, Station No. 23 is quite equal to that in its equipments, and the neat manner in which it is kept.

Late in the afternoon the light-house-keeper dropped in, and signified his intention of going to the point to shoot, and asked, if the "Captain" would join him? I answered that "I would like nothing better." We immediately set off, and had not more than comfortably settled ourselves at our station, when the ducks began to fly. Almost every flock, following the shore, passed near us, so, that for a short time, we had lively work. My Parker gun, which I then used for the first time, I was delighted with. The breech action is perfect and it shoots as strong, and as accurately as any high price English gun I have ever seen.

Having had a hard day's work, I retired early, and had a good night's rest notwithstanding that I was awakened every time the watches were called. The first watch was from 8 to 11:20, the second, from 11:20 to 2:40, then from 2:40 to 6 o'clock. In each watch, a man starts from the station to meet the man from the next station; they interchange names, and the meeting is recorded in the log. At this station, No. 23, there is a large Newfoundland dog named Lion, of whom I must not fail to make honorable mention, as he is quite an important character there. He sleeps a good deal during the day, but at night, he goes out with every watch, making himself useful in the way of carrying the lantern, or basket, or running back miles for any article that may have been dropped.

The following day was Sunday, and I was much pleased to see how well the day was observed by these rough men, not a gun was fired, nor a game of cards or dominos played. In the afternoon, I walked to the Light-house and ascended the tower. As the atmosphere was unusually clear, I had a beautiful view of the bay and coast. While looking toward Long Island, Billie Pearson, an old harpooner, who had put his iron in many a mammoth of the deep, suddenly cried out, "There she blows!" You may be certain, I was not long getting round to his side of the tower, and there, sure enough, full in sight, and not far from shore, was a great "Right Whale," evidently having a good time generally. Every now and then he would send up a column of water that would have done credit to an Iceland Geyser; then, he would dive down, throwing up his huge tail. All this continued until he was out of sight. We estimated that he must have been between sixty and seventy feet in length. A little farther off, we descried another whale, apparently smaller than the first. Both were going westward. Billie was nearly wild with eagerness to be at them, and was heard to say, "If I only had a good harpoon and line, that ar' whale would be in barrel before long, and we, a couple of thousand in pocket!"

We had intended going off to shoot early the next day, Christmas, but the morning proved snowy, and we were compelled to remain in, very much against our inclinations. However, towards noon, the weather cleared off nicely, and L—— proposed a swim in the Boyton suits, in which I readily acquiesced, and with the assistance of the crew, we were soon arrayed in our armor, and a funny spectacle we presented after we were blown up! but nothing daunted, we took up our Esquimaux paddles and stepped off into the surf, which was at that time running very high; we found little difficulty, however, in getting beyond the breakers, the buoyancy of the suit keeping us high above water. It was almost like being on a feather bed. After amusing ourselves in this way for a good half hour, we returned to the house, and on removing our suits, we found our clothes perfectly dry, not a drop of water having entered, and so far from being cold, I found myself all in a glow. I presume we might have remained in the water several hours without the slightest inconvenience. In the evening, we went again to the point, shot quite a number of ducks, mostly pin-tails.

It was long after dark before we left the grounds. The men went round by the boat, but as I preferred walking, I sauntered leisurely to the house, with my gun on my shoulder, though by this time the night was pitchy dark. When within about a hundred yards of our abode I heard a sound in the Southwest, I soon made up my mind something was coming, but what it was, I could not see. Neither barrels of my gun being loaded, I hastened to put in a cartridge, and very soon the something, seemed to be passing over my head, judging from the sounds, I fired, when down dropped a fat brant nearly at my feet.

For two days after that, we had very fair sport, but the weather setting in for a severe storm, which might detain me for a week or more on the island, I concluded to turn my face toward home, rather than run the risk of one of those dreadful little family talks with our estimable Provost.

Early Thursday morning L—— roused me with the pleasing intelligence that it was an excellent day for ducks. I hurried up my toilet as fast as I could by the light of a flickering lamp, and pulling over my clothes a suit of Oil-skins, we started for the ducking ground, and truly a good day for ducks we found it; I never in my life saw so many flocks. In a very little while we had bagged over forty. After which, returning to the Life-Saving Station for breakfast, and bidding adieu to the crew, L—— and I put off for Bay Shore. As the ice in the bay was by this time pretty well broken up, owing to the change in the weather, we were able nearly to reach Long Island shore without much difficulty, and there, after thanking L—— for the pleasant time I had enjoyed, and for his kindness, I took my leave, but long will I remember with delight the Christmas holiday of 1876, with the Life-boat crew near Fire Island. H. L. W.

For Forest and Stream.

THE "SAN GABRIEL NARRERS."

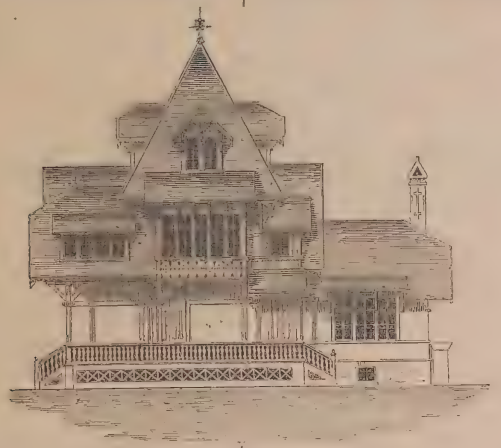
BY EL CAZADOR.

SOME of the boys got to bothering me the other night to tell 'em a grizzly story, and one smallish kind of chap, a pilgrim with gold spectacles, asked me if I hed ever see a "ursus horrybillis (meanin' a bar) in his congeenyol wiles," answering to which I told him the following, and the others listened:—

When me an Tejunga was prospecting the wet far above the San Gabriel narrers, we camped the first nite in the canyon nigh to the Sheep Rocks; where we onpacked our burros thar was a little clear place about thirty yards wide, with green grass in it, an tall bresh an trees all aroun it. The canyon ar not wide to speak ov, an ar deep, with steep, high walls, except one long, low ridge running down from Big Pine Mountain. The nite wur black es a coal mine, an a feller down in that canyon looking up towards the fur off sky mite a thought easy he wur in the bottom ov a well with the histin rope missing. Bar tracks was quite frequent, the leetlest no smaller than a fryin pan, an some of um bigger than a cart wheel. When bar tracks is fresh an gittin fresher as you follers ov um up, its puffeckly astonishing how they duz increase in size. We kinder hated to camp thar they wus so durn fresh an numerous, but traveling arter nite in that canyon ain't to be done. It got cloudy, an a big, thick cloud flopped itself down like a blanket crost the narrer top ov the canyon. Maybe it thought we mite fly out ef it didn't shet us in. We tied two burros up on the side of the cieneja towards the river, hobbled the pochy Jinny (pochy means bob-tailed) an turned hur loose, made a little fire in the open, eat supper ov sap an meat (sap is biled flour with sugar, when you've got it), an turned in to sleep. Boze was terribul oneasy, an kept bristlin and growlin an goin out towards the annemals and smellin round, and finerly kummin back to the blankets would'nt go to sleep, but kept sittin up an watchin an tryin to keep me awake by lickin my face. Arter a while the fire burned down. I remember thinkin mout be sich a little fire felt lonesome in sick a dark nite. Tejunga wus snorein peaceful and reglar. I was sliden into a easy sleep, comfortable as a houn pup arter a good dinner, kud jest about half hear the pochy Jinny croppin the grass, an a muskeeter buzzin a long way off; even the river seemed goin to sleep, and to slide easy and lazy-like over the rocks. So a sudden Boze stuck his cold nose in my face, guv a growl in good earnest, an dashed into the bresh. Then the canyon woke up in a minit; sich a growlin, grunlin an snortin, brakin of bresh and chargin aroun, you'd a thought certain a drove of wild hogs was chargin the camp. It didn't take me an the old man long to make a lite if I know it. At first we thought sure that that bar wur boun to kum into camp anyhow. Him an ole Boze fit roun in the bresh powerful while we made up the fire. Arter we got a tolerable good lite Boze wud cum back every two or three minits to rest, an that thar bar set out thar in the bresh, from whar he kud see us an we kudn't see him, and puffed and pawed roun an bit off bresh amazin. Ole Boze was puffectly happy; he'd run out thar and worry, grab a mouthful ov har, dodge roun in the bresh till he got out ov wind, then run into the fire an wag his tail an brag. The burros was skeered most to death, specially when the bar worried roun to their side ov the cienega. Pretty soon the old man got sleepy agin, an sayin no bar orter spile a man's rest, laid down. I turned in too, an tried to keep the dog quiet, but the bar was too aggravatin by fur, an arter running the pochy Jinny—who'd broke her hobbles—off into the bresh, kum back an kept on raisin cane an foolin round. I spose he'd been used to feed in that cienega, and thought we wus stealin his grass. Finerly he wus so durn mean I got mad, slipped outer the blankets thout wakin Tejunga, put a fresh cap on my gun, pulled my knife an six-shooter roun in front ov my belt whar I kud reach for um handy, an takin the dog by the nek, crawled on my belly out to the edge ov the bresh, an as nigh the bar as I kud git thout brakin sticks an makin noise. He'd always foller the dog to the edge ov the bresh. Well as I kud guess by the soun ov his breathin and gruntin he wur about twenty-five feet off. He smelled powerful bad. I kudn't see my hand thout holdin ov it up towards the sky, the nite wus so dark. Boze wus tremlin all over with fite an anxiety; I feeled kinder nervous myself. I knoed the bar wood foller the dog, the dog wood run back to me, an layin flat as I kud with the gun ready, I kud probly shoot a hole in him somewheres. I sposed he'd run most on top ov me arter the dog, stop, snort, and rar up on end fore he tried to grab me, an thar'd be enuf ov him 'tween the muzzle and sky to shoot at. What wus to foller arter the shot I didn't know, an ef I hed wudn't a took no such chances. I was some younger then than I am now, an terrible brash. Twarn't no time for foolin, you bet, an my eyes stuck out so fur trien to see, that I wus feered ov hittin ov gainst a bush. I turned the dog loose; he didn't heed no sicken. Thar was a crash like a tree fallin as they kum together sum yelpin and gruntin, then the dog run plum over me an put for the blankets. Rite behine him wus somethin like a solid chunk ov nite movin; es it teched the muzzle ov the gun I pulled trigger. The report sounded like a canon. The gun wus jerked violently out'n my hans, trien to roll out'n the way; somethin like a ton ov rock rolled in a buffler robe fell on top ov me. Es I scrambled out from under I went down for my knife, but before I kud use it wus knocked about ten feet, an rolled agin the ole man, who, waked up by the gun, hed run out to help me. I pulled my shooter, but the pile ov blackness representin the "Ursis horrybillis" wur doin its last kickin. We heern a terrible nise of bush brakin and rocks rollin goin up the long ridge, which I've mentioned, an the ole man sed thar must abin two ov um. My sholeder hurt awful bad, but I jest riz up an bag'd one ov um, or two ov um, or a whole corral full ov um. What did I keer? I had killed more bar (in imaganashun) nor Capen Adams, an ef the cap snapped wud a killed that thar ole he jest as easy with my knife. He had tushes an claws a foot long, an weighed a ton. The ole chiefs hart wus too full to speak; he had rased me from a boy, an I knoed he felt proud ov me as I did ov myself. He lit a piece of lite wood, the blaze flickered up kinder lively. We went to whar I'd shot; thar lay my rifle an thar, lyin partly atop ov it, shot throu the bowels an back, powder burnt on the belly, lade the *pochy Jinny!*

TERRAPINS.—Perhaps no luxurious article of food has fallen so little in value as the terrapin. During the rebellion the prevailing price was twenty-six dollars per dozen for full-sized "diamond backs." If the demand for them would have continued undiminished up to the present time, they would now be worth fifty dollars per dozen. For several years past there have been comparatively few sold, and prices have receded to eighteen dollars. When terrapins measure one inch less than the regulated size, eighteen are given for a "dozen. Young "diamond backs," cows and bulls mixed, sell as cheap as a dollar and a-half per dozen. This variety, which is considered the most palatable of the terrapin family, is principally found in the Delaware and Chesapeake bays, where the water is not thoroughly salt. In the bays and inlets along the coast, as far south as North-Carolina, many are annually taken. They usually frequent water not over six or eight feet in depth, and large numbers are captured in heavy drag-nets. Another common way of taking them is with a pair of long tongs, known as "terrapin-clams." A calm morning in the fall, after a hard frost, is usually selected. The water, at this time, is perfectly clear, and while one man stands at the bow with the tongs in his hands, another softly propels the boat. The terrapins are usually seen on the bottom, slightly covered with mud, and the cause of the elevation is soon transferred to the boat. Sometimes they are entirely exposed, lying upon their backs, or only on one side "planted."

A much-prized variety is found in the Juniata river, of this State, and retails at fourteen dollars per dozen. Another species, the common creek and pond terrapin, large numbers of which are taken from the Schuylkill and tributaries, sell at from two to three dollars per dozen. A variety known as the southern terrapin, sent north from Jacksonville, Florida, and other near points, has a remarkably large head, is much inferior in flavor to the "diamond back." It retails at four dollars per dozen.—*Germantown Telegraph.*



Woodland, Farm and Garden.

BEAUTY IN ARCHITECTURE.

COUNTRY AND SUBURBAN RESIDENCES—HOUSE BUILDING AND DECORATING.

THE thoughts which throng upon men and women on the approach of spring are as varied as their tastes, constitutions, habits, and favorite pursuits. "In the spring," sings the laureate, "a young man's fancy lightly turns to thoughts of love." That of others turns to the realization of some architectural dream, and the building of a home wherein to enjoy the beauties of spring and the other delights of country life, as instinct leads the birds to nest building. The fisherman's thoughts are turning to his tackle, and to the time when the hand of the Frost King shall be lifted from his favorite streams. The hunter is anticipating a return to the hunting ground, and is busy adjusting his shot gun and rifle against the opening of another campaign.

Should it be asked, "What has the fisherman or the hunter to do with architecture? Are we to have no more timber huts, no more yarns around the camp fire? Are we to shoot rabbits from our bedroom windows, or stalk the deer upon our lawns?" The answer is simple. The hut and camp will remain, but something requires to be added. Men with the taste and the leisure for out-door sports are most likely to care about the beauty of their country house. Their constant association with the beautiful leads them to desire its reproduction. Then again they occasionally develop a desire to pursue their favorite recreation at leisure, to combine the enjoyment of

playing the kingly salmon with that of contemplation, and not to take all fish and game while they—the sportsmen—are "on the wing." Hence comes the desire to build a house near the most admired section of his terrestrial happy hunting ground. It may be in Florida, or Maine, or on the Pacific slope that he wishes to build a home in or near some vast wilderness or "fish-furrowed stream." There alone can he obtain his heart's desire in the form of a dwelling-place. In the city, even with boundless wealth, he is condemned to live in a parallelopipedon of bricks, with other rectangular boxes on either side. There he lives for convenience; in the country he would enjoy existence in a home constructed upon his own plans, and built to suit his own purposes.

When a few years ago the "Fishing Tourist" gave his book to the world, he suggested an idea which can best be realized in the way here indicated. "Gradually and completely," he says, "can we wean our families from the dissipations, late hours, and unhealthy conventionalisms of fashionable watering-places. By degrees we shall teach our wives and daughters to participate in the favorite pastimes of their husbands and sons; for do they not always take a warm interest in anything that affects us? Do they not sympathize with our views and plans, and mould their tastes to our's?" Of course they do, and in order that the sons may possess the health and strength of Nimrod, and the daughters be something else than fishers of men, take them to a home where they may enjoy what sportsmen enjoy, and acquire their skill.

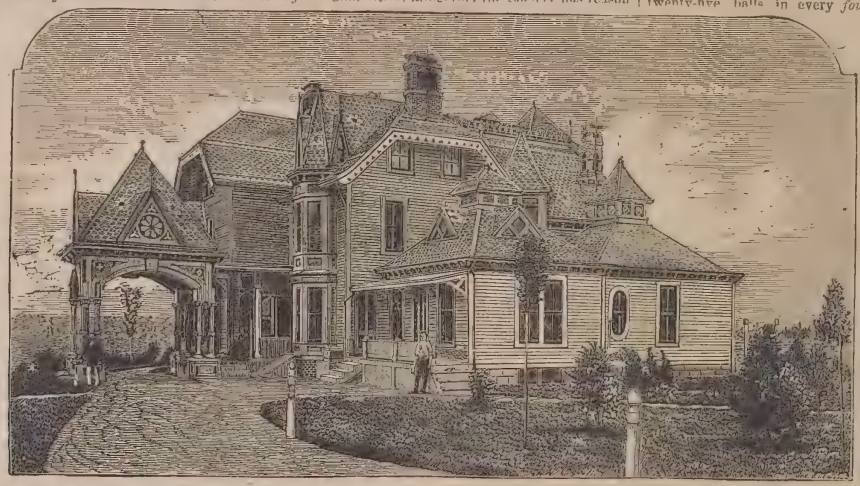
Between the residences above referred to and those known as "suburban," there is a difference, but it is very slight. The same principles of construction apply to both, and they have this quality in common: that they are equally the outcome of a man's individual taste, as distinguished from his city residence, already sufficiently qualified. Away from the city and its interminable rows of monotonous monstrosities, its stores, and its municipal "piles stupendous," one is led into an entirely different train of ideas. We condemn, without qualification, the average New York house. It stands with the wrong side uppermost. The cooking is invariably done in the basement, whence fumes and steam mount through dining-room, drawing-room and bed-rooms, to the great detriment of the occupants, before escaping to the outside world. They are built with regard to supposed convenience and economy of space, and make no approach or pretension to gratify the artistic sense. Not that the latter is impossible. It was suggested some time ago by *Appleton's Journal*, whose editorial utterances are so often directed to the public good, that the housetops might be converted into gardens, but the recommendation, although of a perfectly practical nature, was too much of an innovation to be readily acted upon.

Let us now inquire into the principles, different from any of these, bearing upon the country houses we have in view. After visiting the Duomo at Florence, and the Spanish Chapel in the same city, Mr. Ruskin generalizes in this strain: "The glory of architecture is to be whatever you wish it to be—lovely, or grand, or comfortable—on such terms as it can easily obtain." So far most readers will agree with him. When he goes further and says that "beauty is given by the relation of parts, size by their comparison," our assent is less hearty, by reason of the limitation implied in the terms of the rule. All architectural beauty is relative. On viewing an interior we necessarily have regard to the relation of the parts to each other. The beauty of an exterior is very often relative to its situation and surroundings. A house being a place to live in, and not only to be admired on the inside or from the outside, beauty not related to convenience is a mere mockery. The point is one to be insisted on, as fashion has invaded even the domain of architecture, and men manifest a desire for a fashionable style of house, as they would for a stylish coat—a thing to be discarded when the next whim seizes the inventors of *modes*. The subject must, therefore, be looked at from two points of view—that of internal harmony, and that of external harmony. The former is produced whenever convenience is sufficiently studied. It is the harmony between the thing and its purpose. To follow fashion is to destroy or impair this harmony by insisting upon small windows, the absence of verandahs, thin, spear-like chimneys, or something equally monstrous and destructive of comfort. There are houses—old family mansions—in Europe, to which an occasional wing has been added, as centuries rolled past and developed the necessities of the proprietors. What was their rule? Simply that of convenience, and if there happened to be incongruities of style, the result as a whole is generally found to be charming. This is an extreme case, but it illustrates remarkably well the absurdity of the opposite practice, of sacrificing comfort and personal preference to the conventionalities of style. Above all things, therefore, it is eminently desirable that ventilation and temperature should be kept in mind, and that even at the expense, if necessary, of such decorations as mouldings, carvings and gildings.

The illustrations we give are taken from "Woollett's Villas and Cottages," "Atwood's Modern American Homesteads," and other works, published by A. J. Bicknell & Co., of New York, to whom those intending to build are indebted for many valuable publications. Any of the styles might be modified, if necessary, to suit location. If, for example, a cottage is wanted, say in Florida, for occupation during a few months in each year, the Swiss Gothic cottage, or that shown in the second engraving might be adopted. Such cottages cost from $2,000 to $2,500. The interior of the Swiss cottage is admirably arranged. To the left of the door, entering from the piazza, is a "study" measuring eight feet square, and lighted by two of five windows to the left of the elevation shown in the view. The other three light a parlor twelve feet by thirteen, and connected with it by a folding-door is a dining-room of nearly equal size. The kitchen and pantries occupy the extension to the right. The study is the place for fishing

gear and guns, being easily accessible from the outside, and opening also into the parlor. This arrangement could be carried out without violently wrenching its name, since there excursions would be planned, and there, also, amidst the fumes of the "fragrant weed," would be digested and studied the materials for the owner's communications to FOREST AND STREAM. On the second story are four bed-rooms, and in the attic a large central bed-room of thirteen feet by fourteen for the children. In our second cottage is a chamber eight feet by thirteen for a study, a large parlor or dining-room fourteen feet by seventeen, and a kitchen. The second story has three chambers of the same size and arrangement as those below. In this cottage the study has the advantage of being directly accessible from either front or rear. The other has a corresponding advantage in the greater variety of its rooms. No two are exactly alike, and the second story is entirely different from the first. It is, in fact, a house which it would take a longer time to become thoroughly acquainted with. In either dwelling a sportsman might endure existence without murmuring, always provided sport is good and game plentiful.

The style to be chosen must, however, be determined in all cases by requirement, scenery, and situation. It is always advisable, when possible, to combine beauty and utility. The external harmony to which we referred above is that existing between the house and the ground on which it stands. There are houses which seem to have grown on their sites, so lovingly do they nestle amidst the trees or shrubs, and so perfectly do they harmonize with the tones of nature. There are others which stand out in continual protest against the taste which planted them, where they can never be anything but a discord in the landscape. What produces this harmony? Is it lofty turrets or wide piazzas; or large windows or porched doorways, or what else? We can only answer that it consists in no single one of them. The air pervading the house of human beings with sensibilities and affections, and we might add, with common sense, differs vastly from that surrounding the garish edifice of the lover of mere style. If we come to analyze the difference, we shall, in all probability, find that in the latter everything has been sacrificed to fashion or style, and that in the former everything has been kept secondary to the health, comfort, and freedom of the inmates. If it be once thoroughly understood that the exigencies of situation transcend the rules of the prosaic architect, the solution of the problem is very nearly reached.



Nothing would be more silly than to lose a fine prospect because a window at the point whence it could be obtained would be a breach of the architectural proprieties. Let us suppose again, that the building is to be erected within hearing of the soothing hum of a waterfall. Would it not be an abandonment of one of the advantages of the site, to turn a dead wall to its soft melody, because, accord-

ing to an arbitrary dictum, no bedroom or sitting-room ought to open in that direction? To do so would be to defeat one of the objects of the annual rush from the dingy city to the bright country. Everything ought rather to be done to promote communion between the visitor and the scene visited, and to teach him to perceive and enjoy all its beauties of sight and sound under the best auspices, and rules so framed as to be incompatible with such enjoyment, should be summarily thrown aside. Many other points demand decision by a precisely similar standard. What constitutes harmonious beauty in a house requires intimacy to be appreciated. Whenever strict rule is followed, glance at the house is sufficient to reveal every quality it possesses. That which we prefer must be lived in and studied, and even long occupancy may leave its tenant under the impression that he is only partially acquainted with its merits.

Every house does not instil the feeling experienced in a home. The destruction of timber, not classed by horticulturists as ornamental, is one of the greatest manias of house-builders. In nine cases out of ten it is better to build the house to suit the trees, than to clear a site by their removal. The loss sustained by cutting down some majestic elm or gnarled oak is irreparable, and no man with a soul worth saving could be guilty of such an enormity, unless the operation be a necessity of the most imperative kind. If they obstruct a particular view, it is better to make a window somewhere else, from which the prospect can be enjoyed.

Another very common error is that of ruthlessly cutting up the sward into walks. Grass, as a rule, looks better than gravel, and is less suggestive of the restraint imposed by many upon their friends to "keep off the grass." The green carpet of turf round a house is like the background of a picture. It gives softness and tone, which are effectually destroyed by a broad sweep of hard, pebbly, or shell-covered walk. Keep, therefore, all the turf possible, and the grand myriad-armed trees, that there may be a place to be in shelter and at rest, to listen to the splashing of the fountains erected on the lawn, and to view the most restful scene in the world—the clouds sailing slowly across the sky.

Our third illustration gives a very fine specimen of the substantial country-residence. It is noteworthy to the architect for the following reason, that although enlarged by the addition of a laundry, dining room, pantries, etc., a perfect unity of style has been preserved. Its entire cost was about twenty thousand dollars, not a very extravagant sum for a suburban home, of which any man might be proud. We could suggest improvements on the grounds, but instead of remedying an evil, let us now turn to our last engraving, and admire its unalloyed beauty. It illustrates very closely the best properties to which we have referred. The house rests softly amongst the trees, and the sward running closely up to the walls, and broken only by the main approach, is not forbidden ground to the inmates. They appear to be free and at home, and resting upon the whole place is an air of quietude and enjoyment, very pleasant to contemplate even in a picture.

THE NEW YORK HORTICULTURAL SOCIETY held its regular monthly meeting on Tuesday, the 6th ult., at their rooms, 55 West Thirty-third street. That these meetings have stirred up those who love horticulture, this meeting showed by the large attendance, and the interest exhibited in the plants and flowers before the society, as well as in the extra interest shown by the competitors themselves to have their different exhibits only first-class. A very interesting and instructive address was delivered by Mr. Augustus Boileau, on the best method of the cultivation, pruning and training of fruit trees, which was listened to with marked attention. Addresses on various subjects connected with Horticulture are to form a feature of these monthly reunions, and will doubtless add greatly to their interest and success. Premiums were awarded as per schedule, to William C. Wilson, Astoria, L. I., for the best 24, 12, and 6 *Hyacinths* in pots, to William Bennett, Flatbush, for 6 *Azaleas* in [illegible] plants, but beautiful varieties; to Charles Zeller, Flatbush, for six pots of *Lily of the Valley*, finely grown; to E. Kasold, Brooklyn, N. Y., for twelve cut blooms of *Camellias* to name; to George Luck, South Amboy, N. J., for the best twelve bunches of *Azaleas*, and a fine collection of *Violets* in bunches. Special premiums were awarded to Isaac Buchanan for a very rich collection of rare and beautiful *Orchids* (cut blooms), comprising over twelve varieties; to James Riddle, gardner to Mrs. Brooks, Inwood, N. Y., for a lovely basket each of *Cineraria* bloom, *East Lothian Stocks* and *Violets*; a beautiful *Tree Fern*, and two fine specimen *Azaleas*; to William Bennett, Flatbush, for six good pots of the lovely *Dendrobium nobile, Imantophyllum miniatum, Azaleas*, and fine specimens of cut blooms of *Carnation;* to Thomas Ascott, Flatbush, for a collection of *English Primroses;* to Thomas Tait, Port Richmond, S. I., for a fine collection of *Echeverias;* and to William Ball, Spuyten Duyvil, N. Y., for *Achyranthes, Hay's improved*. Special mention was also made of a lovely plant of *Phalaenopsis Schilleriana*, exhibited by James M. Paterson, Newark, N. J.; the rare *Iris Susiana*, exhibited by L Roches, Jersey City; *Bougainvillea glabra*, and *Oncidium luridum guttatum*, exhibited by S. Henshaw, New Brighton, L. I. A beautiful pot of *Lilium longiflorum*, and a flower spathe of the curious *Amorphophallus Rieveri*, were also deemed worthy of special notice by the Committee, altogether the Society has reason to be proud of its success, as shown in the interest manifested in its monthly meetings.

—The Minnesota Foresty Association has offered to furnish from three to five hundred thousand young forest trees and cuttings to those who have lost their crops and are now in danger of losing their timber claims for lack of money to purchase.

MANDARIN, Fla., Feb. 27th, 1877.

EDITOR FOREST AND STREAM:—

It is the last of February and vegetation is well warmed into existence. The blooms have been on the peach and plum trees for a fortnight or more, and in the woods the yellow jessamine is dropping its flowers, and violets are scattered all over; but a week or more of chilly weather keeps the swollen orange buds closed. We are on the eve of having the air perfumed so that none can escape its fragrance; each sprig of the orange tree is full of white buds, and one or two warm days will open to our eyes the pleasant blossoms, and to our nostrils the grateful perfume. The past season has been an "off" one for oranges; the trees took a rest and did not yield with their greatest abundance; it is not unusual for them to do this occasionally. But look at them this spring. All I have seen are loaded with buds and it looks as though they had got back to business again with redoubled vigor. What a tree it is! Long care and attention it must have when small, or it will not do much and most likely will die, but when grown it repays well the care bestowed, by its long continued and abundant yield. "How long does an orange tree live?" I asked a grower. "As long as a man will, and perhaps longer, for all I know. Look at these trees; fine specimens certainly; not many in the country so large. Here are three which in a good year yield 16,000 oranges, they were full grown trees and frozen down in 1835, but soon picked up again, and have been bearing ever since." I have looked at them for six years and time apparently has no effect on them.

It is such a task to raise an orange grove that you comparatively seldom see a large one of old tree; that is, where there is one large grove there are a host of small ones.

The farmer generally needed his land so much for his crops yielding an immediate return, that he could not afford to give it up for orange trees and wait a half dozen years for a profitable yield. The State needed an immigration of those who could afford thus to wait, and they have come, and are coming daily.

The best land for orange trees is the "hammock," and if low, it must be drained or nothing can be done satisfactorily with it. Give the tree room enough, and sun enough and it will come on finely. It has been said that orange trees will do well if set out in the native forest, but many who have tried this find it necessary, under such dense shade would not seem to be a promising place to cultivate any kind of a tree unless we concluded that the sun's rays are of no benefit to plant life.

In the latter part of January the new growth begins to put out, about the 1st of March there is a shining array of it, which on the bearing trees is beautifully adorned with the blossoms; then the tiny orange is formed, and all summer long the green globe smells, and gets its golden color when November comes. You may eat them after that before breakfast or after tea, and they wont hurt you. Who ever heard of any one getting sick in Florida eating oranges. C. D. D.

Game Bag and Gun.

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, &c.

—The first snipe of the season killed in this vicinity was brought to our office on Monday by our friend Justus Von Lengerke of Hoboken.

CAPT. BOGARDUS' MATCH.—To-morrow night Capt. Bogardus shoots his great match of skill and endurance against time, at Gilmore's Garden, in this city. By the terms of the match the Captain undertakes to break one thousand glass balls, thrown from his new patent trap within the space of two hours and forty minutes. To realize what is required in the way of dexterity and skill to accomplish this feat it must be figured down, and in this way we find that he must *break*, not merely shoot at, twenty-five balls in every *four* minutes. That the Captain will accomplish it we have but little doubt, as there appears to be nothing practicable with a gun that is not within his powers. He will use Ditmar powder, so that there will be but little noise and no smoke, and as only glass balls and not pigeons are to be destroyed, we see no reason why the ladies should not give the entertainment the encouragement of their presence,

NEW JERSEY—*Tenafly, March 10th.*—Woodcock made their first appearance with us on Friday, the 2d inst., and were seen to come in large numbers. Wilson snipe were heard from on the 4th inst., but the main part of the flight has has not arrived. RED WING.

MASSACHUSETTS—*Cohasset March 12th.*—Have seen several flocks of ducks this week, and one goose swimming by himself alone in the pond; also large flocks of blackbirds and robins, and there were some snipe on the meadows the the 10th, but we could not get on to them. A friend of mine has a large white owl, caught this winter in a spring-up rabbit trap. A rabbit having been caught, the owl tried to get it out, and in so doing got his own foot caught. He is now very tame, and will eat and drink from his hand, a very different disposition from the large brown owl, which I found to be impossible to tame so he would not bite. Yours, truly, S. K., Jr.

Salem, March 12th, 1877.—Have been at Ipswich since last Thursday. Some black ducks about; Stone killed ten last Monday, and one Friday night; Russell shot two Saturday, a. m. This is rather poor, but will be better soon. Ducks quite shy. Ice gunning is done for in the "Hundreds," but is yet good in "Fore" river. Gulls numerous and shy. Snow buntings are not to be seen, which, with other signs, indicates an early spring. Blue birds were seen a week ago, and red wings are along. Snipe grounds are promising to be in good condition. Game law questions are not yet on "even keel." Yours, etc., TEAL.

PENNSYLVANIA.—A correspondent writes us from Lancaster, under date of March 9th, that he noticed a solitary jack snipe a few days since, the only one seen in that vicinity so far this spring.

MICHIGAN—*Detroit, March 9th.*—The State medal was shot for yesterday. In accordance with the English rules, adopted at a meeting of the Detroit Gun Club, each sportsman shot at eleven birds at thirty yards rise, and from five ground traps. E. H. Gillman won the medal for the twelfth time. ROVER.

MINNESOTA—*Lake City, March 8th.*—March came in like a lion—moderated last night—now snowing hard. Geese seen as early as the 15th of February; ducks about the 25th. Have just learned that the mallard has remained on some of our large rivers all winter—unusual.

D. C. E.

KANSAS.—A correspondent writes us from Atchison, Kansas, under date of the 8th inst., as follows:—

All kinds of game have passed the winter in good shape, and at the present time chickens and quail are very plenty.

There were but few quail killed the past season, and there is promise of an unusual large supply for this falls shooting. Ducks and geese have been flying very thick for the past week, and afford fine shooting. Yesterday it rained, which froze as fast as it fell, and I witnessed something I never saw before. Geese were flying thick, and as their wings became coated with ice they would drop, and could be picked up by hand, being perfectly helpless. A large number were caught here in town. The old saying of "Not as much courage as a goose," did not work in this case, for they would bite and fight when caught, and exhibited as much courage as a bull dog. We have succeeded in getting some amendments to our game law this winter, which will be vigorously enforced in this section. Very little if any game was trapped in this vicinity this winter, and *none* shipped, as the pot-hunters and trappers were afraid of the law. Yours, truly, H. R. B.

TENNESSEE—*Nashville, March 4th*, 1877.—Samuel D. Edmondson, residing in Lawrence county recently killed seventeen partridges at one shot, and ten at another. (Shame.)

Granville Hensley, living on Shoal Creek, Lawrence, Co., has captured a very large wolf, and keeps it chained in his yard.

The Maury County Sportsmen's Club has been reorganized. Rules and regulations for its government have been adopted. The laws for the protection of game and fish are to be examined, and any change necessary will be reported and steps taken to have the same provided for by the General Assembly.

John Vantreese, whose residence is near Pinson, Madison, Madison county, has a partridge which came to his house over six months ago, and took up with the chickens. It was full grown at the time, and gradually became gentler, until it now eats and roosts with the poultry.

Andrew Meadors, captain of the Hugh McCrea, No. 1, fire engine, in Nashville, is one of the best shots in Tennessee, and a great admirer of the FOREST AND STREAM.

The "Rock City Shooting Club" is not dead, but only sleeping. Several pigeon shooting matches will be given under its auspices ere long.

A deceased member of the Saurian family, thirty-two inches long, was lately found near a spring on his farm in Jackson county, by J. Q. A. McClelland.

The game law of Tennessee went into effect on the 1st instant. FRANK FERN.

—Capt. Ducaigne remarks, in a late letter, that one dealer in the neighborhood of Worthington, Nobles county, Minnesota, has, during a part of this season, purchased 54,000 muskrat skins. The animals were trapped in the immediate vicinity.

—A rich contractor was holding forth upon the instability of the world. "Can you account for it, sir?" he asked, turning to Foote.

"Well, not very clearly," he responded, "unless we suppose it was built by contract."

Fish Culture.

SALMON IN FRESH WATER.

LACROSSE, Wis.

EDITOR FOREST AND STREAM:—

The Superintendent of Fish Farming for Michigan has stocked a large amount of the fresh water streams and lakes of that State with salmon fry, and in his last report indulges in a little speculation as to the success of the enterprise. There has been a great deal written concerning the habits of salmon and yet it remains an open question as to whether they regularly return to the sea after depositing their spawn. It is possible the present attempt to raise them in large numbers in fresh water may tor ever settle the question.

The writer of this article for two or three years observed with very great interests the habits of this noble "stag of the stream," in the waters of Oregon, and was lead to believe that a long residence in fresh water rendered them diseased and worthless. The reasons for this belief are found in the following well authenticated facts: The salmon fresh from the sea run up the Columbia and Willamett rivers to Oregon City, where with wonderful strength and celerity they throw themselves up the sixty feet of almost perpendicular fall and spead onward towards the rocky bedded streams in the mountains. These magnificent specimens are often taken as they dart up the fall by the spearmen, and are of far finer flavor and stronger flesh than any salmon taken on the coast, while those taken fifty or sixty miles further up are almost totally worthless. Some satisfactory reason may be found for this fact in the natural peculiarities of the streams. In the winter during the heavy rains and melting snows these streams become irresistable mountain torrents and plunge madly and wildly over their rocky beds, carving out deep basins and wild caverns, which as summer and low water approach become beautiful pools of pure cold water and deadly aquariums. Above and below these deep holes the stream spreads out and falls placidly over the level rocks, leaving perfect flow for the stream, but an impassable barrier for any luckless fish caught in its toils. In all these pools, without exception, may be found hundreds of salmon in all stages of disease—some dark and almost as active as in perfect health; others spotted with white and others white as lepers, perfectly helpless and almost dead—while masses of putrid carcasses line the banks for many miles. There is abundance of pure water and food, and yet they die and the only apparent reason seemed to be that they were prevented from returning to the sea to regain the health and energy wasted on the fresh water spawning beds of the upper streams.

If the salmon shall become a healthy denizen of Michigan lakes and streams, some other cause must be assigned for the great mortality that prevails along the tributaries of the Columbia river. H. W. T.

Remarks.—It is a very well known fact to Pacific coast ichthyologists, as well as to many in other parts of the world that the salmon enter the streams in fine order, direct from the sea, and grow thinner and more spare as they reach the spawning grounds at headwaters, where, having at last fulfilled their mission and deposited their ova they die and rot. Not one in a hundred ever return to the sea, whether their passage be obstructed or not. Their progeny run down to the sea in due time (two years or more,) and return fine fish.

FISH CULTURE IN CALIFORNIA.

EDITOR FOREST AND STREAM:—

I am happy to state that our Fish Commissioners are moving actively and efficiently in stocking our lakes and rivers with various kinds of fish. They have recently forwarded 130,000 young white fish to the Truckee River breeding grounds, to be put in Lake Tahoe, near Hot Springs. The journey and transportation was attended with much labor and difficulty, the snow being in many places three to six feet deep. The distance was sixteen miles, which consumed more than a day's time with a stout team to pull through the snow and ice. Six men had to attend the operation and take all the necessary care and trouble. A few days before this, 75,000 young white fish were placed in Donner Lake, high up among the snow clad mountains, and 25,000 in Sereno and other lakes, near the Summit Station. Much the same difficulties had to be encountered on the road to Sereno lake, owing to the great depth of snow, it taking more than six hours to get over the short distance of a mile and a quarter. This lake was covered over with thick ice, and holes had to be made to put the young fish in. They had to be conveyed in a handsled drawn by two stout men. The demands from private and other sources for a part of the lot of Eastern trout sent here, and which were in the hands of our State Fish Commissioners, had not only caused the supply of these young fish to become exhausted, but the Commissioners have had to disappoint many others who have made applications for them, as they have been informed by their correspondents in the East that they were unable to forward as many as they had hoped to do, and which we here were rather led to expect. These were for the purpose of stocking free our public waters and streams.

Our energetic and efficient Commissioners have entered into an advantageous agreement with Myron Green at the United States Fishery, at McCloud river, to purchase some California mountain trout eggs, with a view to hatch out and place the same in some of the exhausted streams of the State. Mr. Green has secured some 200,000 trout eggs at McCloud river, which he has to dispose of. These eggs were taken from fish averaging about two pounds weight, and of a different variety from those found in the coast streams which empty directly into the Pacific Ocean.

We have now the satisfaction of knowing that the young shad planted in the Sacramento river about three years since, have borne fruit, many of them having been taken accidentally in some nets used for other purposes. The closed season for these fish will expire in December, 1877. Prof. Baird is about to send 3,000,000 more the coming season, to be placed again into the Sacramento river.

During the past year, the Commissioners have had hatched out and placed in the Upper Sacramento, Pitt and McCloud rivers, and their tributaries, 2,500,000 young salmon. They intend doing this every year, but they need larger appropriations from the Legislature than they now receive for their piscatorial operations, yet these failing they intend doing the best they can, under the circumstances, and they are very active and judicious, and deserve great credit for their exertions, especially too, the most practical and industrious of them. I would not be surprised if, either next season or a year or two hence, young salmon will be so numerous in our bay and rivers that they will be caught in as great numbers as smelts used to be taken on Oakland Long Wharf, and Long Bridge on the San Francisco side of the bay. They will probably by and by go even beyond the needed consumption by our people.

It is reported that the 200,000 young salmon placed in the Truckee and Little Truckee rivers, Donner lake and Prosser creek, are doing well also. Exchange fish from Japan and Hawaii have not yet succeeded well for us, but the salmon we sent them have prospered. We are not discouraged, however, and will still try to obtain some of their ova, (some 15 pounds in weight), mullet and carp.

We have received 300,000 white fish eggs from Michigan. We are now hatching them at Berkeley, near Oakland, where is the State University. We are next year going to attempt success with the famous Dolly Varden trout found in the northern part of this State and in Alaska. They attained a large size. They spawn at a different time from our brook trout. They only thrive well in ice-cold waters. We intend also obtaining the eggs of graylings, the product from which will be planted in some of the highest and coldest streams of the Sierras. I will only add to my, perhaps, too tedious narrative, that the Schuylkill catfish, the Mississippi catfish, and black bass are doing well in our waters. E. J. HOOPER.

PLANTING FRY.

EDITOR FOREST AND STREAM:—

In Mr. Thompson's reply (last week) to Mr. Clapp, referring to the proper time for turning out young salmon, he says: "Any one seeing them eat should not advise their being turned out to die as soon as the sac is absorbed." Having "turned out" a large portion of those hatched by Mr. Thompson, the past season, and also missing many thousand hatched elsewhere and given the subject the most careful attention, I am most decidedly in favor of turning them out as soon as the sac is absorbed, and before they have been fed. Reasons in future if desired.

MILTON P. PEIRCE.

Wenonah, N. J., March 12th, 1877.

Natural History.

For Forest and Stream.

HALF HOURS WITH AN AQUARIUM.

OUR aquarium was not governed by the stringent rules which are in force at the corner of Broadway and Thirty-fifth street, hence I could enjoy my after breakfast pipe and the study of our pets and their habits at one and the same time; and to follow a little further on this lead, hence again it is very possible that our neglect of the stringent but wise rule "no smoking allowed" may have contributed more or less to the briefness of the period during which we were able to cultivate each other's acquaintance.

Fishes are not partial to tobacco, however good, and as a general rule it does not improve their condition to feed them at odd times with whatever may seem a dainty. It is not always the fly that tickles the fancy of a verdant fisherman in a store, that finds the most favor with a trout or bass, and it is quite possible that crumbs of cracker, cheese, ham, eggs, and sundry other articles gleaned from the *debris* of breakfast, did not, in all cases, agree with our prisoners. So their lives in general were short, although science did all it could to prolong them. Our sea water came to us in a constant stream. Like Tennyson's Brook, it went on forever—that is, except in case of calm weather, when, deprived of a motive, the fans of our wind-mill stood idle, and caused us many an anxious foreboding of increased mortality. Each tank received its supply through an ingenious tube which, working on the principle by which I once colored a meerschaum, drew air with the stream that nature would not have added to the natural supply. So far as suiting their appetites for air went, our plan was somewhat of an improvement on nature for the more you opened the valve and let the bubbles accumulate thicker and faster, the more our pets would come to that corner and imbibe.

We did not deal in whales nor sharks, but the small fry furnished us enough to study. I would not disparage the curious and quaint creatures which at the Aquarium delight daily so many; but it is not necessary to accumulate strange or rare fishes to make an aquarium an interesting study. I propose to tell you about several of the most common of common fishes a little that I fancy will be novel to many who from boyhood have captured thousands.

The Flounder is not a very interesting creature, unless you are fishing for flounders; it irritates you to have one take the bait so carefully arranged for his betters; in the market you can hardly find a cheaper or more common fish, yet a little one lying quietly on the bottom, or slowly sliding along by an almost imperceptible motion, has a point of interest—two of them. Apparently an inert mass, two little eyes are in constant motion, noticeably so, for they are not, as with ordinary fish, sunk in their sockets, but placed on the top of little horns, somewhat resembling those of a crab or snail; and with these lifted fully an eighth of an inch above the plane of their sockets and constantly turning watchfully, a complete circle, they can, as they lie, detect the approach of food or danger from the rear as well as front, and from either side. This is not, however, the normal position of the eye; it is only for occasions when he lies low and looks out; stir him up, and as he glides away the eyes retreat to a more natural position, and the peculiarity is no more to be noticed than in case of a larger one on the fish stand.

We had a little Turbot two inches long. I never saw his eyes so elevated, but he strongly resembled the flounder in many respects, differing however, in the situation of his mouth. To this difference we may add an excessive one in his name, for Bean told me that he was a *Lophorctta* —something, and the flounder—wasn't. (I find my memory at fault, and must content myself with negative evidence). Either or both would make a pretty *bas relief* for a paper weight, and I tried to put one in plaster for that purpose. I failed. Palmer said I "had him too wet," but as shortly after he accounted for my failure on a Scup (*Stenotomeas argyrops*) by saying that I "had him too dry," I am not fully convinced that to either one cause or the other can be wholly attributed my failure. I told you about Palmer and his work in my Bluelight letter. He never failed till he got hold of a fish (remora, I believe,) that had on top of his head a sucking apparatus to hold on by; that fellow didn't let go the plaster worth a cent; all the world went to the "Exhibition," and had a chance to see the splendid collection made by Palmer. I did not send mine.

The Tautog has very curious habits when little; when big they simply bite, and you pull them up and throw in again. But a little one long enough in his prison to become accustomed to it is like Artemus Ward's kangaroo—a K. K. Sneaking around among the algæ, pecking through the mimic forest of their stems, with stealthy, cat-like action, he searches for his dinner. Finding a snug, well-concealed cavern, he hides himself as completely as possible. If the side of his retreat is a sloping rock, it is all the same to him, for he will lie over against it for all the world like a pig against a post, and completes the resemblance by an occasional rub to and fro, no doubt enjoying a most satisfying scratch. He looks lazy and harmless, but let an incautious cunner heedlessly approach his lair; in an instant he is right side up, and in another shoots out at the intruder, and but that the latter makes a most inglorious retreat, there would be battle waged. By-the-way, it is a curious thing, but the attacking fish always whips; a little tautog will drive a big one, if he makes the onset. It may be that it requires the preliminary hiding and watchfulness to develop their pugnacity.

Our little Sea Bass (*Centropristus atrarius*) had a curious habit. Drifting slowly along and passing over a stone, they would settle down and perch on it like a bird, the two pectoral fins being extended downward and acting as feet, and I think as legs, for I could almost assert positively that I saw one one day walk along the stone. But the gentleman (in Bermuda) who supplied me with his Latin name is equally sure that I was mistaken; so I'll just say that I thought so.

Our File fishes (*Alentera cuspicanda*), were a never failing source of amusement: odd in shape, odd in action, and at rest, they were constantly doing things differently from other fish.

To properly appreciate a cuspicanda, he must be viewed in profile; a bird's eye view would be very unsatisfying. We

had them from four to eight inches in length, and the biggest was not over a quarter of an inch thick, and this at his best and thickest part; near the eyes, where he was two inches deep, tapering off, both in width and thickness, to a flat, pointed tail, which latter, in its rounded shape, and worn and ragged appearance, reminds one strongly of a well worn corn broom after many days of hard scrubbing. What is the Latin name for a broom of that description? if there is one, he should have it. As far as color goes, he is a pretty fish, with rich brown stripes, mottling on a bright orange ground. From his eyes, his head tapers, more abruptly than his tail, terminating in a snout resembling that of a pig, the lower jaw, however, projecting beyond the upper; this jaw he uses as a shovel or scoop, digging in the sand or gravel, or scraping a rock, for his food. At rest he is curious, for like a bat, he reposes head downward, slowly sinking, till when near the bottom, especially, if his descent has brought him before the door of a tautog's castle, he suddenly shoots tail first to the surface—without a movement of said tail. This latter organ is not with him the propeller, for he has a habit common to but two others, namely, the pipe fish (*Tautoga orilis*), and the sea horse, or hippocamus, of performing his swimming, by means of his greatly developed dorsal fin, which, with a peculiar, not easily described undulation, answers for fin and tail both.

Our Sea robin (*Prianotus evolans*), was perhaps our most gorgeous pet, homely in shape, not unlike a skulpin. Nature has recompensed him with the richest of hues, and with a pair of pectoral fins, so large and beautiful, that they justify his being classed with the birds.

Little blue fish, (snapping mackerel the natives call them) we had in plenty. Whenever I had nothing else to do, than to practice fly fishing, they would take the lure like a trout, and for a few minutes give me lively work, but they soon gave out—and so in our Aquarium—they were a thing of beauty, but not a joy forever; they could not stand confinement, and were short lived pets.

We had one old lady crab, about as large a specimen as is ever seen, and she was burdened with fully a quarter of a pound of eggs, attached to her person, in the usual way adopted by the family—there is a Latin name for the place, but I forget it. Ugly was not a name for her temper. The instant her tank was approached, she was claws up, ready, anxious for a fight. An attempt to stir her up with a stick was safe, but it would have been a mangled hand that tried it. As the stick entered the water, she would spring a foot to grasp it, and left her marks. Worn out with constant teasing, to which Prof. Smith most strenuously objected, she got tired of life and resolved that her offspring should not endure it; grasping as many eggs as her big claws could hold, she tore them from her and threw them to the right and left, unceasingly, till at last, angered, I guess, because there were some she could not reach, she stretched out and shook her claws, and left us to mourn.

Then we had pilot fish, *Pompano*, scup, sand lances, and I don't know how many other varieties. Of the sea anemones and hydroids, the latter were very beautiful, as seen here and there among the rocks and bright green sea lettuce—little clusters of spray-like substance—bright gray with thousands of little stems and white flowers, so fine and delicate as to resemble the "smoke plant." "What a lovely flower," said a lady, who could hardily believe, when I told her that each little flower was endowed with life, and was only more astonished, when under the microscope, she saw revealed the rare beauties and rich tints to the naked eye invisible. If I had but saved my mislaid notes, I could recall a great many pleasant half hours, but writing from memory, I can only congratulate myself, that although our Aquarium is a thing of the past, there is another on a grander scale, where time spent is saved to one who loves to search deeper than the surface, and to learn, as to familiar things the "reason why."

There I learned why one must troll slowly for pickerel:—

One morning a little salmon presented to the experienced eye of Mather evidence that he was soon to die—and for experiment we threw him into the tank where two little pickerel were swimming. In an instant they both saw him, but neither attacked the swift, darting troutling, till at last when quiet in a corner, both pickerel pointed for him, and remained at point, as steadily as two well trained dogs, one backing the other. Suddenly one darted, and there was no more little salmon, but the other pickerel, as though petrified, preserved his point at the corner fully a minute. PISCO.

WHERE WOODCOCK BREED.—The very careful observer and naturalist, Mr. Geo. A. Boardman, who is now in Florida, gives to us this week, the very important statement that woodcock breed in Florida. A boy brought him one the other day, with two young chicks, a week or two old. He says these are the first he ever heard of breeding so far south.

BLACK SNAKE *vs.* RATTLESNAKE.—A correspondent, A. D. W., of Hanover, New Jersey, calls our attention to the well known fact, that the black snake is the inveterate enemy of the rattlesnake which it generally, or perhaps most invariably, vanquishes in combat. An instance to which the party was eye-witness, is thus described:—

"In the middle of the road lay an ordinary black snake and quite a large rattlesnake eyeing one another fiercely, both ready for an attack. The party stood motionless to see the battle take place; but he waited long, and still the combatants did not move. At length tired of watching, he slightly shook the bar of the fence, which caused the rattlesnake to look from its opponent to himself. Instantly the black snake sprang on the other, twisted itself tightly around its neck, and then its body, and glided off, and there lay the rattlesnake, dead. The victim we all know was a powerful foe, the victor as harmless a snake as there is in the land."

SNAKES IN WINTER.

POTTSVILLE, PA., March 5th, 1877,

EDITOR FOREST AND STREAM:—

In the issue of your valuable journal of the 22d ult., I noticed an article from a "Stoverstown" correspondent on "Snakes in Winter," which reminds me of a circumstance which I have never deemed worthy of revelation. The farm on which I lived some years ago had a large springhouse on it provided particularly for dairy use. Immediately on the exterior of the building was a large walled-in spring which produced a strong stream; a hole ten inches square, with an iron grate in it was made in the wall, admitting the water, the grate prohibiting the entrance of muskrats and other animals. From the entrance of the door to the level of the stone floor there was a descent of four stone steps, under which was provided a channel for water three feet wide by eight inches in depth, (which was in same proportion all around in the interior of the springhouse). From one to three large water snakes would harbor under those steps a whole winter; they were often seen in the channel (the spring water being warm in winter time), and they would move with great nimbleness and rapidity. While they never disturbed any luxuries in or out of the water, they totally demolished all lizards, toads, frogs and roaches. ALEXIS.

JACKSONVILLE, Florida, March 5th, 1877.

EDITOR FOREST AND STREAM:—

Woodcock have been more abundant than I have ever known them, some afternoons would get up a dozen; very unusual for East Florida. I wing tipped a snipe, *Gallinago, Wilsonii*, it fell into the water; the dog going to retrieve it, it would dive like a grebe. I have known the spotted sandpiper to do this, but never a snipe. They are fast leaving for the North. A quail started to fly out on the St. John river, and lighted in the water, in going for the bird with a boat, it flew from the water and saved itself; no stick or chip could be seen. My friend Mr. Livingston, shot a large rattlesnake. It had a good sized rabbit in its throat all covered with saliva; on pulling the rabbit out of its mouth it soon ran away apparently uninjured.

Saw the first purple martin, *Progne purpura*, February 2d; have seen them come to the boxes in Jacksonville, the 11th February; this year they are a little late.

The only swallow we see here in winter is the white-bellied, *Hirundo bicolor*. GEO. A. BOARDMAN.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE WEEK ENDING MAR 10.—Three sea lions *Zalophus gillespiei*; one black bear, *Ursus americanus*, presented by Mr. G. P. Morisini, from Black Hills; one mottled owl, *Scops asio*, presented by Mr. de Lagnel Berier; one camel, *Camelus dumedarius*, born in the menagerie; one Macaque monkey, *Macacus cynomolgus*, born in the menagerie.

W. A. CONKLIN, Director.

Sea and River Fishing.

FISH IN SEASON IN MARCH.

Brook Trout, *Salmo fontinalis*. White Perch, *Morone Americana*.

FLIES FOR THIS MONTH.

Dark Fox and Black, Grey and Claret Gnats, on 13 hooks (small.)

FISH IN MARKET.—Notwithstanding the demand for fish incident to this season of the year, owing to the open weather the supply is so abundant that prices are not only much lower than usual, but this week show a still further decline. The event of the week has been the opening of the trout season, and to-day, for the first time since September, the *salmo fontinalis* is exposed for sale. During the next three days the visitor at Fulton Market will find himself amply repaid by a visit to the stand of Mr. E. G. Blackford. There he will see trout from every part of the country from Maine to California, and the British Provinces as well; wild trout and tame trout, both alive and dead, and ranging in size all the way from the little "fry" just clear of the umbilical sac to the great three-pounder.

Our prices for the week are as follows: Striped bass 15 to 20 cents per pound; smelts, 18 to 20 cents; bluefish, 15 cents; salmon (frozen), 25 cents; California (frozen), 45 and 50 cents; shad (southern), $1 each; mackerel, 30 cents; white perch, 15 cents; Spanish mackerel 50 cents; green turtle, 22 cents; terrapin, $15 per dozen; frostfish, 7 cents per pound; halibut, 18 cents; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 18 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 18 cents; turbott, 18 cents; scollops, $1.50 per gallon; whitefish, 16 cents per pound; pickerel, 15 cents; sunfish, 10 cents; yellow perch, 6 cents; salmon trout, 15 cents; Canada brook trout, 40 cents; Long Island trout, $1.25; hard shell crabs, $4.00 per 100; red snappers, 20 cents.

The trout season opens to-day on Long Island. The ponds and streams were never in better condition at this time of year. The "opening" will be attended with its usual festivities.

—The mountain streams in Central Pennsylvania are reported to be swarming with speckled trout, and anglers begin to grow impatient.

Shad have made their appearance in the Delaware.

—The fishermen of St. Augustine, Fla., are delighted over the arrival of the drumfish season. The large drumfish are beginning to bite finely. They often reach the weight of from fifty to eighty pounds.

—Mr. Endicott ("Ted Grayson"), of Beekman street, this city, has been at Homosassa, Florida, for several weeks. He has sketched and painted all the different kinds of fish that take the "fly" there.

BLACK BASS FLIES.—The star of the black bass is certainly in the ascendant. Through the exertions of the Fish Commissioners and Fish Culturists he has been placed in many waters all over the country, and has propagated and multiplied until his tribe has become numerous throughout the land. Consequently, while the orders for trout flies have possibly not diminished the present season, those for black bass have measurably increased, so that the tackle dealers have to prepare stock altogether various and new. There are constant inquiries after approved patterns—examinations of the old, and suggestions for new ones, so that their assortments, etc., are rapidly growing; and by the time that *M. Nigricans* flings his sportive fin above the wave there will be no limit to the kinds of flies, minnows, reels, rods, lines, and other apparatus.

The "trout in speckled pride" may not have had his day; but if he is not actually to be superseded by his neighbor, he is henceforth to have in the black bass a rival for the favor of fastidious anglers. The results of trouting expeditions have been so unsatisfactory of late years that both novices and experts will be glad to find sport that will almost certainly repay them for their pains and outlay during their limited vacations.

We have been at some trouble to assist our leading tackle dealers in procuring special patterns for bass flies, for it has become very obvious that with bass, even more than with trout, particular colors, sizes, and structure of flies must be employed for different waters. The same fly will not suit everywhere. In dressing flies for bass it is not necessary to follow nature; indeed such nondescripts of anatomy and hue were never even dreamed of by entomologists as those that are deftly fashioned and fabricated by our chief manipulators. Nevertheless, many of them are marvels of ingenuity and brilliancy. Some that have been handed to us by Messrs. Holberton and Beemer are beautifully tied. The hand that fashioned them has in days past wielded a skillful artist's brush, and we do not wonder that he who can faithfully portray the real on canvas, is able to put into almost animate shape the delicate materials that have had their being in the upper air, where mere moths and ephemera can never attain in their clumsy flight. There are four patterns of Holberton's flies lying before us; one a copy of the Ferguson fly; one a turkey brown; a turkey green; and one exquisite new creation quite properly christened the Holberton fly. It has an orange body ribbed with gold tinsel; head of peacock's herl; a hackle of peacock's herl mixed with purple; tail of wood duck feathers tipped with scarlet; under wing coverts of scarlet ibis mixed with mallard feathers dyed yellow, outer wing coverts of wood duck feather, with two long rays of peacock's herl, the latter giving the fly a very jaunty and attractive appearance, which even the best educated salmon could not resist. We do not know what this fly will do for black bass, but we shall at once add a dozen of them to our own stock of salmon flies, and would advice our Canadian friends to do so. It will make a very fine companion to the "silver doctor." The "Turkey brown" has turkey wings, brown body ribbed with gold, red hackle and wood duck tail streaked with scarlet; the turkey green is similar, except that it has a green body. The Ferguson fly has been repeatedly described in our paper. We can recommend Holberton & Beemer to our friends.

ARTIFICIAL ANGLE WORMS.—Wm. H. Gregg, of St. Louis, has patented an imitation earth-worm, made of India-rubber or other flexible material, to be substituted for the squirming live angle-worm so long in use by boy anglers, and eagerly sought for by the "early bird." It exactly resembles the natural squirmer in color, and certainly possesses the advantages of cleanliness for use. It cannot be taken off the hook by nibbles, and needs no preparatory "scouring." We should judge it to be a good thing, although the inventor has sent us no sample—neither advertisement. By the way, we forget to say that one quality claimed for the artificial worm is, that it can be used for *chewing-gum*, whereas the natural "worm," when carried in the mouth, is not altogether pleasant to the taste, and is liable to slip down the throat or out from between the teeth.

FISHING MOVEMENTS.—The Georges fleet continue to come in, but give no indications of an improvement in the catch, and the receipts are light for the season, with little old stock on hand to draw from. Since our last issue 36 arrivals have been reported, bringing in about 950,000 lbs. codfish and 70,000 lbs. halibut. Three herring fares have been received the past week, from Grand Menan and Nova Scotia, giving a total of 39 fishing arrivals for the week.—*Cape Ann Advertiser, March 9th.*

* ALLIGATOR GAR FISH.—These fish inhabit the Mississippi river from the mouth to the Falls of St. Anthony. They are taken weighing as high as 100 pounds, but average about 20. They are entirely separate and different from any other known fish, and although not a game fish considerable sport can be had with them, owing to the extreme difficulty of holding them with any common fishing line, or rig. They have a long snout or bill, of hard bone, full of sharp teeth, which cannot be pierced by any hook, so they can only be taken by their swallowing the bait, to add to the trouble, they are very dainty.

In the spring of last year, I took one at Castle Bluff near Winona, Minn., which weighed 140 pounds, being the heaviest fish I ever took in fresh water. This may be of interest to some of your readers who chance to be going that way, and would like to try it. They laughed at my whip, as they called my rod, (one of C. F. Orvis' black bass rods,) and said I would break it with a shinner; but I told them and they found it to be true, that I could catch any fish they had in the river with that whip, and I did. I took this one with a red trout fly with wire leader three feet long, which he swallowed and could not bite off. He took out 125 yards of silk line and I played him for half an hour, but could not get him to the boat, and having no gaff I finished him with a pistol ball in the head, about 50 feet from the boat. I also took large numbers of pike and pickerel without any trouble with the same rod, many of them weighing 12 pounds. S. K., Jr.

TROUT FISHING IN ICELAND.

EDITOR FOREST AND STREAM.—

In "Littell's Living Age" I find Jon Jonsonus Saja. The genuine autobiography of a modern icelander, wherein he says.

"A very amusing sort of fishing sometimes happens, viz. when the waters have frozen in entirely calm weather, then becomes the ice transparent and clear as crystal, so that every atom can be seen at the bottom of the lake, which is not deeper than one or two yards. When the ice is strong enough to bear the weight of a man's body. I used to run to and fro on this clear ice and search out the trout. When I got view of one, I pursued it in full speed in order to wear it out, below my feet, which lasts some few minutes. During this short time one is compelled to run of all night in a zigzag to follow to the many turnings of the trout. At last it is so weary that it goes very slowly on and stops at once, and puts the head in the muddy bottom, without moving a pin, I made a hole in the ice and hooked the motionless trout. It happened some day's that I went out on this sort of fishing but caught few, or could sometimes not run as fast as the trout, and lost it of sight."

The trout are spoken of as "gold colored." He says, further in speaking of netting trout at night:

"We get sometimes bigger trout, even ten or twelve pounds, and from ten to twenty in number in this same manner."

It is evident that there are no game laws in Iceland as this night netting is done at "the general spawning time, viz. from the beginning of November till New Year." Again, he says:

"We resume this method of fishing on six to ten shallows in a night. In former days this manner of fishing were very lucrous (lucrative) as the farmers fished from twenty to eighty some evenings, but it has lamentably diminish in this latter and more severe winter."

I should think it was lamentable to catch fish only at spawning time, for the author of the above states that fish will not bite in summer when they have plenty of fleas and midges on the water. The difference in spawning places of from 200 to 800 per cent. should be a strong place for protection. "GLEN'S FALLS,"

Rational Pastimes.

The Philadelphia *Mercury* says, "that two standard works on base ball, which are published annually—"De Witt's Base Ball Guide" and "Beadle's Dime Book of Base Ball"—will be published this year a month earlier than usual. Both will contain full statistics of the season's play of 1876, by non-League as well as League Clubs, beside special instructions for scoring under the new rules of play. Each work contains a hundred pages of closely printed matter, giving information on every point of the game. Each differs from the other in essential points, the Dime Book being more for the amateur majority class, while the Guide is designed for professional instruction. The name of Henry Chadwick, as the editor of these two works, is a sufficient guarantee for their reliability and value as works of reference."

BASE BALL.

—The League nines which have been completed are the Chicago, St Louis, Louisville, Brooklyn and Boston. The Cincinnatis are incomplete as yet, and decidedly mixed. It remains to be seen whether Manager Keek can organize a harmonious team out of the rather incongruous material he now has at command. It will test his ability to the utmost, and if he succeeds Harry Wright will have to tender him his hat. The names thus far slated are as follows:—

CHICAGO.	ST. LOUIS.	LOUISVILLE.
Smith, c.	Clapp, c.	Snyder, c.
Bradley, p.	Nicholls, p.	Devlin, p.
McVey, 1o.	Dehlman, 1st b.	Latham, 1st b.
Barnes, 2d b.	McGeary, 2d b.	Craver, 2d b.
Anson, 3d b.	Battin, 3d b.	Hague, 3d b.
Peters, s. s.	Force, s. s.	Gerhardt, s. s.
Glenn, l. f.	Remsen, l. f.	Hall, l. f.
Hines, c. f.	Eggler, c. f.	Ryan, c. f.
Waitt, r. f.	Bloug, r. f.	Lafferty, r. f.
BOSTON.	BROOKLYN.	CINCINNATI.
Brown, c.	Allison, c.	Hicks, c.
Bond, p.	Larkin, p.	Matthews, p.
Murnan, 1st b.	Start, 1st b.	Jones, 1st b.
Leonard, 2d b.	Burdock, 2d b.	Hallinan, 2d b.
Sutton, 3d b.	Ferguson, 3d b.	Foley, 3d b.
G. Wright, s. s.	Carey, s. s.	Booth, s. s.
White, l. f.	York, l. f.	Higham, l. f.
O'Rourke, c. f.	Holdsworth, c. f.	Pike, c. f.
Manning, r. f.	Nassby, r. f.	Addy, r. f.

—By the last of May the position of the nines will have been changed somewhat. Latham will be found to be interior to Gerhardt at first base in the Louisville nine, and Crowley will probably take his place in the team. Spalding will be likely to be in the Chicago nine, with Bradley at first base, and Waitt in Smith's place. The Boston team as also the Cincinnatis will be changed in their positions.

—Play has commenced at Prospect Park, and every fine, sunny afternoon, is taken advantage of to get off practice games by the professionals now in Brooklyn.

—The new Atlantics are yet in doubt as to their regular League name. It is so desirable that the new team should be called the Atlantics, that no doubt some arrangement will be made to admit of the desired change, otherwise the Club will be called the Brooklyn. They will assuredly not be called the Hartfords of Brooklyn, because the Atlantics of Brooklyn would be used if the League allow any such title.

DETROIT—*Michigan, March 9th.*—The Chatam Curlers came to this city yesterday morning, and played the Granite Club, of this city, at the Rink, on the Peninsular Cricket Grounds. The Granite's won by a score of 40 to 20. In the afternoon the Chatam men revenged themselves upon the Sarnia curlers, and cleared them out by a large majority, to wit: 38 points. ROKER.

CLEANING CHROMOS.—Take one drop of machine oil upon a linen cloth, or a soft chamois-skin, and rub it over the picture very gently. And if the varnish is dulled or rubbed, you can revarnish it with the nicest map varnish, taking care to use only a very small quantity of it.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

A SUBSCRIBER, Brooklyn.—Can you tell me of any place in New York where birds' eggs and skins can be purchased? Ans. J. Wallace, 19 North William street.

C. A. H., Ansonia, Conn.—1. When is the law off brook trout in Connecticut? 2. At what age should you send a puppy to be broken? Ans. 1. April 15th. 2. At from six to eight months.

C. W. M., Philadelphia.—Your dog probably has worms. Give him Areca nut in three doses of 20 grains each two hours apart, following the last dose in four hours with one ounce of castor oil.

J. C. H., Greenville, Pa.—Your dog, the dimensions of which we have not space to publish, is undoubtedly very large, but not too much so, we think, for breeding purposes. We prefer a large dog for a stock animal.

J. W., South Haven.—Could you inform me where Damascus double barrels can be found—barrels only—size No. 8 bore, 30 inches length or less? Ans. From Messrs. Schoverling & Daly, No. 84 Chambers street, this city.

E. H. F., Philadelphia.—Can you inform me where and at what price I can obtain about 75 black bass for stocking a stream? Ans. Milton P. Peirce, of Wenonah, Gloucester county, N. J., can supply you with black bass at a low figure.

H. A., Montpelier, Vt.—You can get the information you want about the Newport boat by writing to J. T. B. Smith, box 106 Kingston, N. Y. Number your questions, keep a copy yourself, and enclose postage stamp for reply.

M. E. H., Vergennes.—Can you inform me where I can obtain some live quail? I want them for a friend who has written Whitley & Morris, and they say they have none. Ans. There are none to be had in this city. We have written south to see if they can be had there.

D. O. C., Girardville, Pa.—Last fall some black bass were placed in a dam which was well stocked with trout. Will the bass exterminate the trout, or do both species thrive in the same water? Ans. The black bass will play the mischief with the trout.

J. H. H., Jersey City.—Is Steel's "Flake" in the Westminster Kennels, and has he been sold lately? Ans. Flake is the property of W. F. Steele, Esq., and is not in the Westminster Kennel. His litter sister Whisky is the property of that club. Flake has not been sold.

P. L., Philadelphia.—Will you please name some of the points on the Schuylkill river where there is bass fishing? Is there any fishing in the Chamounic creek? Ans. Conshohocken, Norristown, Phenixville, and Pottstown. Trains of Reading Railroad go direct.

H. H. H., Chattanooga, Tenn.—I want a work on Ornithology that will enable me to identify birds from the description. Please inform me through your columns of "Answers" where I can procure such a one and the price? I have "Coue's Field Ornithology." I wish as late and complete a work as possible? Ans. You want Dr. Coue's "Key to North American Birds," price $6.

C. H. M., Hartford.—1. What is the cheapest and best food for a large kennel of dogs through the summer season? 2. What would it cost per dog per month to feed on Spratt's patent dog food? Ans. 1 Oat or corn meal boiled with scraps of meat. 2. On an allowance of one and a half pounds per day it would cost $4.50, but we are told that thes this is an excessive allowance for a dog.

DON, Harrisburg, Pa.—I have a setter dog six months old and would like to know if you can tell me from description, and give what stock he is and if there is any good blood in him. Color orange and white, brown nose, and taking in all a well-built dog. Also tell me what is required to enter dogs in your Register. Ans. Your description is not sufficient to enable us to judge of the breeding of your dog. Send his pedigree and it will be entered in the Register.

GUN, Chestnut Hill, Mich.—1. What is the address of the company that makes the Allen rifle? 2. Has there ever been published any book or article on the headwaters of the Connecticut river; if so, please give the name of book or paper and where it can be bought? Ans. 1. Forehand & Wadsworth, Worcester, Mass. 2. In our issue of November 11th, 1875, is an article entitled "Trouting Among the White Hills" which describes the headwaters of the Connecticut. We know of no book.

A. B. K., Virginia City.—Some time ago I wrote to you about my No. 10 choke bore Parker gun not killing. You suggested that I must be mistaken about its penetration. I have tried it as you recommended. The target used was a dry pine board. The charge was 5 drachms powder and 1¼ ozs. No. 4 shot; distance 30 yards; penetration about ¼ inch; both barrels about the same. Do you call that even fair penetration? I think it very light. Ans. Considering the charge and distance the penetration was poor.

GORDON, Providence, R. I.—1. What sort of food is best for a setter not being shot over, and also is oatmeal a good thing to give him every day? 2. Is there any book that has a complete treatise on setters, how to train them, and how to take care of them, etc., and if there is, what is its name and cost? Ans. 1. Oatmeal, or cornmeal mush, made in water in which meat has first been boiled, and the meat chopped up and mixed with it, is good food. For one dog there should always be table scraps enough. 2 Dinks, Mayhew & Hutchinson is the best book for you. We can send it; price $3.

J. L. S., Rochelle, Ill.—I have a fine native Irish setter dog that is badly afflicted with I may say an itching sensation in his feet. It commenced some four or five months ago by a slight inflammation around the toe nails, which caused him to lick continually; and finally the irritation became so great that he has gnawed off four of his toes on each hind foot to the second joint of toes; also part of the ball of the foot; does not seem to be lame (except when he strikes them against something), and is in fine flesh and as healthy as any dog I ever saw. Ans. We should annoint the toes with a mixture of tar and zinc ointment; both are healing, and the dog is not likely to lick it. If he persists in doing it use the whip and he will probably desist from what may now be merely habit.

H. L. K., Stoughton.—I have a valuable setter dog from Scranton's stock of Providence. He is now 18 months old and I am afraid I am going to lose him. In January he had a severe touch of distemper and since that time there has been a slight yellowish discharge from his eyes. For the last three days he has eaten nothing; is very poor and is constantly trying to throw up something; he also drools. Can I save him? Ans. We should commence with calomel at once, giving the dog at first 20 grains in a dry powder on the back of the tongue. Give also 10 grains of quinine in two pills each day. If the calomel moves him too freely administer an enema of 15 drops tincture of opium and two ounces of starch water. Administer beef tea, by injection if necessary.

G. D. K., Carlisle, Pa.—My setter dog Bob, about 13 months old, has for some time been troubled with a short peculiar cough. It seems as if he had something in his throat and was trying to expel it. About every other time he coughs he expels a teaspoonful of white slimy looking matter. Another thing that troubles me in regard to him is that he is unable to locate the sound of a whistle. I have thought that perhaps he might have canker in his ears, as when you speak to him he turns his head to one side, I have also noticed that he scratched his ears a great deal, and that he exhibited signs of great distress by moaning? Ans. Give your dog a five grain quinine pill twice a day; also a Dovers powder night and morning. Dissolve 20 grains of sulphate of copper in four ounces of water and after washing your dogs ear with Castile soap pour in a little of the wash twice a day for several days. Feed no meat.

C. H. F., Glen's Falls, N. Y.—I have looked through several of my back numbers of FOREST AND STREAM to find the proper dose of areca nut for a setter pup a year old slightly troubled with distemper, but fail to find it. Will you kindly give me the information? Ans. The dose of areca nut for *worms* is, three doses of twenty grains two hours apart, the last one followed in four hours by one ounce of castor oil; but for a slight attack of distemper you will probably find a cure in a Dover's powder placed on the back of the dog's tongue night and morning for two days.

C. G., Webster, N. H.—Some three or four years ago I started a small aquarium. Among the rest of the inhabitants thereof were some black-nosed dace (*L. atronasus*). One of them by accident lost the greater part of his tail. In the course of two weeks it had grown to its former size. I would like to ask if it is common for all fish to grow new fins and tails when they lose them by accident, or whether it is confined to a few species? Ans. It is not uncommon for a goldfish to grow part of a lost fin, and perhaps other soft-finned fish, as the dace, etc., may do the same; never noticed it in this; have to-day cut off a fin from one in the Aquarium, and will note the result.—FRED MATHER, Supt. Fish Culture.

W. MACK, Milwaukee.—1. I have a muzzle-loading shot gun with the name Perkins on the lock plate and London fine twist on barrels. Under the barrels, near the breach, it is stamped three or four times with B. V. or R. V. and a crown. Also with a stamp. Do you know of any such a maker, and do you suppose the barrels are genuine? 2. What table is referred to when drachms and grains of powder or shot are mentioned as a charge for a gun? Ans. 1. We do not know the maker, but the barrels are undoubtedly genuine as the stamp is that of the Birmingham proof house. 2. When "grains" are alluded to Troy or apothecaries weight is meant, but the "drachm" of powder is an arbitrary term representing about 27½ grains Troy.

H. R. B., Atchison, Kan.—Will you please inform me the proper time to sow wild rice, and if it should be planted in water or on the banks of marshes beyond the water line? Where can we purchase 5 or 10 bushels? Ans. Chop with a hoe a strip ten feet wide along the margin where there are wet flats, and then sow broadcast. Flood a half inch deep with water, so as to cover the seed, and draw off when the seeds have sprouted. When the blades have grown three or four inches, flood again. When it is well rooted it will grow well in deep water. A bushel of seed to an acre is sufficient. It will not spread to the upland. Wild rice sows itself and grows rapidly when once established. Seed should be sown in spring. To ensure it, it would be well to sow both in spring and fall. Rice readily adapts itself, in time, to great changes of soil and temperature. You can procure the seed from Richard Valentine, Janesville, Wis.

C. S. K., Washington City.—In your last list of dogs registered in the kennel book you have entered my dog Pilot as Pilot II, when I claimed Pilot as an original name, the dog's grandsire being called Pilot, not Pilot. Mr. Miley told me that that was the name of the pup's grandsire, owned by Mr, Waddell at some time, as it bore the name of Waddell's Pilot. The pedigree ran as follows, viz.: Dam, Maud, by Gipsie, by Pilot, by Rodman's Dash. Am I correct or in error? 2. Is it advisable to "wring off" the tips of the tails of puppies at the age of five or six days, and if it would disfigure a dog to cut off an inch or two of the tail when eight months old. Ans. 1. The pedigree was entered in the name you sent, Pilot II. We do not know any dog named Pilot. Mr. Waddell's Pilot, now dead, was by Jarvis' Dick, out of Nelly. You had better send to Mr. Miley for a correct pedigree. 2. A setter's tail should not be cut unless when the dog gets his growth it is still found to be too long, when it may be taken of to a suitable length.

J. B., Montreal, Canada.—What is the scientific name of the so-called whitefish of the St. Lawrence river? It is not the famous whitefish of the Upper Lakes, but a much smaller fish, is silvery in appearance, resembling, I am told, a shad in some respects, and usually weighing only about three or four pounds. I am informed that it is only found in certain localities, one of which is below Ogdensburgh. I cannot mention with certainty any other places, but I have heard that it is sometimes taken in the Oswegatchie river, which falls into the St. Lawrence above Ogdensburgh. Ans. Unless the whitefish referred to is the same as that inhabiting the Saskatchewan, and called *Coregonus labradoricus* in "Hist. Nat. des Poissons," we cannot say from the description. In our issue of Feb. 8th we referred to a *coregonus* described in "Thompson's Vermont" as the *Hoden cloladus Le Sueur*, or winter shad, which is probably the fish you have in question.

W. H. P., Port Canly, La.—Will you tell me where I can procure a book on the manufacturing of artifical flies? Can Capt. Tombs's "Spinning Eel" be procured in this country; if so, where? Ans. The best instructions in dressing American flies are those prepared for the Second Volume of this paper, Nov. 12th, 13th, 14th and 16th, by Thaddeus Norris, Esq., author of the "American Angler's Book." We send you the series by mail. The technology of fly tying can be learned through the following English works, viz.: Ronald's Fly Fisher's Entomology; Ghitty's Fisher's Text Book; Pullman's Fly Fishing; Choimondly-Pennells Fly Fishing; Ephemera's Handbooks of Angling, all published in London, and to be bought from importers in this country; also, Max-Von den Borne's Illustrated Angler's Handbook for 1875, published in Berlin, Prussia. Dawson's Pleasures of Angling; Scott's Fishing in American Waters; Norris's American Angler's Book; Roosevelt's Game Fish of the North; and Hallock's Fishing Tourist all contain more or less instruction in the art of angling in America. We never saw the "Spinning Eel."

M. G., Louisville, Ga.—1. Does not Fox make guns as small as 14 gauge 30 inch 7 pounds weight, and use U. M. C. Co.'s shells, made of this (14) gauge? I think a 10 or 12 gauge, 8 or 9 pounds weight too heavy and too large in the bore for pleasant or economical shooting at quail snipe or squirrels. I see Parker's list mentions no gun smaller than a 12 gauge? 2. I have a 9 pound W. & C. Scott & Sons 32 inch 10-gauge, which seems to weigh about 12 pounds after a two or three hour's tramp It kicks like a mule and makes as much smoke nearly as a field piece, though it shoots well. Would it impair its shooting to reduce it to 30 inches? Ans. 1. The American Arms Co., who make under the Fox patent, would probably make 14-gauge guns if so ordered, but you can get 12 gauge guns to weigh not more than 6¼ or 7 pounds. 2. It would not injure the shooting of your Scott gun to reduce the barrels to 30 inches if they have not been choke-bored. The kicking is owing to faulty loading and the smoke to bad powder.

W. M. L., Noblesville, Ind.—What is the price of the "Warwick Woodlands," by Frank Forester, and on what kind of field sport does it treat? Ans. The "Warwick Woodlands" treats of woodcock, quail and ruffed grouse shooting. You can probably get it from Messrs. T. B. Peterson & Bros., Philadelphia. The price of the original book was about $1 50.

RAMROD, Boston.—1. Do fish hear? 2. I have some Ely wire cartridges for a muzzle loading gun 11 gauge; by peeling off all the paper thus leaving the wire netting surrounding the pellets, could I not use them in a breech-loading gun of a smaller bore? 3 The wads of my paper shells do not closely fit my metallic ones, both being 14-gauge, so what size shall I ask for, for my metallic shells? 4. In what manner can I approach extremly timid ducks on a river so that I may obtain a shot with a shot gun? Ans. 1. No. 2. No, you could not use them as they would not enter your shells. 3. For metallic shells 14-gauge, you want No. 12 wads. 4. By careful stalking only.

—A recent arrival in this city from the "Land o' Cakes" engaged a room in a boarding-house at the sum of five dollars a week. He had a tremendous appetite, and the lady of the house, finding that she was losing by her boarder, took the only way out of the difficulty. On the third week she informed him that she would be obliged in future to charge him two dollars extra. "Seeven dollars!" was the rejoinder. "Dinna dae't, mem, dinna dae't! It's a' I can dae to eat five dollars worth."

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 15, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

THE FLORIDA STAR.—Messrs. W. H. Coe, C. H. Coe, and W. A. Coe (we might say Coe & Co.), have just commenced the publication of the Florida *Star* at New Smyrna—a monthly periodical devoted to agriculture, immigration, and the material interests of the State. The publication is a creditable one, and will be useful to all who read it, whatever may be the pecuniary success of the proprietors. In the hope of great future emoluments, they now charge subscribers but 50c. per annum, or about the cost of blank paper and postage. While we do not encourage the venture, we certainly wish it every success.

CONLIN'S GALLERY.—It is with great regret that we announce to our out-of-town readers, the destruction by fire of Mr. Conlin's rifle and pistol gallery. This unfortunate event, by which we lose (temporarily only it is hoped) a popular place of resort, occurred on Saturday night last, and Mr. Conlin's loss is quite a severe one. Some friends, including Messrs. Lane, Blydenburgh, Cheever, and many others, propose getting up a benefit match, the proceeds of which will assist in fitting up a new gallery. The riflemen of New York owe much to Mr. Conlin, as he has been the instructor of many of our leading long range and off-hand shots, and we trust that when the occasion arrives, due notice of which will be given in these columns, such a "bumper" will be given here as will show him indisputably the position his many genial and manly qualities have made for him in the hearts of the riflemen of this vicinity.

—The Twenty-second Regiment enjoyed one of its agreeable reunions yesterday evening, at their Armory in Fourteenth street, with a full dress parade promenade concert, and dancing. Affairs of this kind constitute the bright side of "sojering."

—Parties desiring plants or seeds are referred to the announcements of several responsible dealers in our advertising columns.

—The mean noonday temperature at New Smyrna, Fla., for the month of February was 59 degrees; highest, 73 degrees; lowest, 42 degrees.

—Some of the city bars serve their customers with blue glass tumblers; and when brandy is burned in them, the toper has only to imagine the rest.

FATE OF THE BUFFALO—ITS SUCCESSORS.

THE buffalo will soon exist only in the annals of the past. As the day of extinction approaches it is a matter of satisfaction that his history has been written. Nor is it a mere dabbler in science, who has detailed to us the past and foreshadows the future of the American bison, but one of the ablest naturalists of America. Mr. Allen, not only gives us the fullest possible account of the habits and peculiarities of our well known existing species, but relates as well all that is known of the gigantic individuals of its race which existed in prehistoric ages. *Bison latifrons*, the largest of these early forms, must have been a giant indeed, for the horn cores of one individual are thirty-two inches in length from the base to the extremity, and when in position must have measured seven or eight feet between the tips. When covered with horn their extent could hardly have been less than ten or twelve. As the same measurement in *Bison americanus* is but fifteen inches, the reader can readily imagine that the former, in size, must have been a fit companion for the *Mastodon* or those enormous sloths, *ellegalonyx* and *Mylodon*, which in Post Pliocene times inhabited our continent.

All writers agree that the day is not far distant when the buffalo in a state of nature will be unknown on the broad prairies of the west, which for so many centuries have been its boundless pasture. We have but to consider for a moment its former range to be convinced of the justice of this conclusion. The Great Slave Lake once marked the limit of its migrations on the north, on the south Mexico, Oregon and California, on the west with Pennsylvania, Virginia and the Carolinas as the eastern boundaries. Over this vast extent of territory the bison roamed in great herds comparatively unmolested. By the end of the first quarter of the present century it had been driven entirely west of the Mississippi, and the species is now confined to the region of Texas, Colorado, Kansas and the Indian Territory on the south, and Montana, Athabaska, Lesser Slave Lake, and the Saskatchwan on the north. But even from these circumscribed feeding grounds it is fast being driven. A gentleman who has recently returned from Western Kansas, where he had been in camp for eight months, informs us that there are at present no buffaloes whatever in that section of the country. During all the time that he was in the field he saw but one solitary individual. Only one herd is known to have crossed the Smoky river during the past year. This consisted of about three hundred individuals, and passed near Monument Station on the Kansas Pacific Railroad; by the time it had reached the Saline it was discovered by the Otoe Indians and the white hunters, and in a few days was absolutely wiped out of existence.

Mr. Allen's recent work has awakened a widespread interest in this subject, and again we advance our protest against the indiscriminate slaughter of the buffalo, and urge that some immediate action be taken in the matter of buffalo protection. A few individuals of the European representatives of the genus still inhabit the dark forests of Lithuania, thanks to Imperial protection, and if the American bison is to be saved from absolute extermination governmental interference must speedily be exerted in its behalf. In the Yellowstone National Park we have the necessary territory, and it is already stocked; but the skin hunter, that ruthless destroyer of game, must be kept at a distance, if we would hope to save this species. This section of territory is by law forbidden ground to the hunter, and could the statute be enforced the buffalo, which at present exist in considerable numbers in this region, would have an opportunity to increase, and might endure there long after their recent prairie range has become a region of smiling wheat farms and well-stocked cattle ranches. The bill setting aside the Yellowstone Park as a Government reservation says that the Secretary of the Interior shall "*provide against the wanton destruction of the fish and game found within the park, and against their capture or destruction for the purpose of merchandise or profit;*" and in a recent report on this region by Col. Wm. Ludlow, Corps of Engineers, important suggestions and recommendations are made, which, if followed out, would accomplish the end so much to be desired. After speaking at some length of the outrageous and wanton destruction of game, which at present takes place in this *Government Reservation*, Col. Ludlow concludes with these pithy sentences: "Visitors should be forbidden to kill any game. Hunters should have their arms and spoils confiscated, besides being liable to prosecution."

But this is not the only means by which the buffalo may be preserved. An animal which in all essential respects agrees so closely with the domestic cattle must surely prove of vast importance to the farmer and stock raiser, if its domestication were but systematically attempted. We have at various times seen in Montana, Nebraska and Kansas young buffaloes running at large with the herds of domestic cattle, and in their actions resembling in all respects their tame companions. With the cattle they would wander off for days or weeks to distant parts of the range, returning from time to time, and being quite as gentle and docile as the other individuals of the herd. When these calves approach maturity, what more natural than that the bull should be broken to the yoke? The owner is not slow to avail himself of their enormous strength, and teams of young bulls are by no means uncommon in the vicinity of the buffalo range. A Montana settler told us a year or two since that a yoke of these animals which he had until recently possessed could pull more than "any two of cattle on the place." Their power and endurance are undoubted, though their temper is not, perhaps, of the best. In fact it is said that if they desire to go in any particular direction, or not to go at all, nothing that the driver can say or do will have the slightest effect in changing their determination. Such little eccentricities as these, however, would no doubt be overcome after a generation or two of domestication, or might be more immediately modified by a cross of domestic blood.

The experiment of cross breeding the buffalo with our domestic stock is said to have been successful in the highest degree wherever it has been attempted. The progeny seem to be very hardy; the milk of the cows is exceedingly rich, and the supply bountiful, and the flesh is in no respect inferior to the best beef. Gallatin states that ninety years ago both pure and half bred buffalo were common in Virginia, the calves being frequently captured with dogs and brought into the towns to be reared. Mr. Robt. Wickliffe, writing to Mr. Audubon, in 1843, mentioned that for thirty years he had bred the pure and mixed stock with success. Ultimately, however, through lack of care, the race of the bison has in all cases been merged into that of the domestic stock. In the West the experiment is now being tried once more, and we earnestly hope that it may succeed.

It is an accepted fact that the buffalo on the plains is to become a thing of the past, but there remain these boundless prairies, their former feeding grounds, still covered with the richest of pasture. Already these are becoming immense stock farms, over which range hundreds of thousands of the broad-horned steers of Texas. The old buffalo ranges are filling up with cattle, and by the importation of blooded bulls the quality of the stock is being continually improved. From these plains a large portion of the beef for eastern and European consumption will ultimately be derived. Before the buffalo wholly disappear some intelligent effort should be made for inter-breeding on a large scale, so that ere the last of the shaggy wild brutes have yielded up his life there shall have been infused into our western cattle the hardy blood of their obliterated relatives.

Thus the plains and bluffs will not be tenantless. Long after the dark, serried, and resistless masses have disappeared, and the thunder of a million hoofs has died away, there will remain a new race blending the best qualities of our present stock with those of the buffalo. So may these sturdy half-breeds wander over and draw fat subsistence from the same hills which were once blackened by the dusky hordes of their untamed ancestors.

SKATING.

ROLLER SKATING IN EUROPE.

The perusal of a long letter from Mr. J. L. Plympton, the American roller skate patentee, whose name in London affords an opportunity to give some interesting information on the subject of the progress of the new American exercise in popularity in Europe. When Mr. Plympton first introduced his new roller skates he had them patented in Europe as well as in America; but it was not until he himself had succeeded in making the Yankee exercise fashionable in London and Paris that he encountered any opposition from infringers of his patent right. As usual this came from men whom he had specially favored. For the past two years he has been in litigation with infringers in the principal cities of Europe, and in many instances has he plainly established his patent right. The work has been costly, however, his expenses exceeding $73,000. The battle, however, has been won at last, and now all is plain "sailing" for him.

Besides fighting with infringers on his patent rights he has had to oppose a system of management of established skating rinks which he has found to be damaging to the very best interests of roller skating as an unobjectionable recreation. Mr. Plympton's principle in the running of roller skating halls or rinks has been to govern them in such way only as to make them peculiarly attractive to the best class of society, as resorts for the enjoyment of a recreative exercise morally as well as physically healthful. His idea of the management of a rink is to keep it free from anything like the vulgar performances of a public place of amusement. For this reason he has opposed the plan of management which has characterized some of the London rinks, and notably those of Paris, in which nightly bills of special performances, by professional actors, on roller skates, are prepared the same as at a varieties theatre. All this kind of thing Mr. Plympton regards as entirely out of the legitimate sphere of a recreative exercise designed for family and social enjoyment. He says in the letter in question: "Having succeeded, after many years of hard work and at great expense, in making roller skating fashionable and popular in England, and having recently seen the greatest damage done to its permanent success in Paris and on the continent, by inexperienced and short-sighted management, I wish to guard against anything of the kind happening in America."

Referring to his success against infringers of his rights he says: "Of the nineteen successive injunctions granted against infringing parties in England since our sweeping verdict against Malcolmson, thirteen have come up and settled handsomely, and many of them were strong companies, having lords, members of Parliament, and high titled personages as directors; and the six remaining cases have just been consolidated by order of the Court, and my rights will soon be as fully here as did the Kemball case

in America." Writing of what he calls the "high pressure" system of running skating rinks, Mr. Plympton says: "that this system has alternately failed wherever it has been tried." He states that "the great high pressure Parisian Rink, which flourished for a short time upon the good name our own work had given roller skating in England, and managed by Baron B——, who introduced nearly every objectionable feature that promised immediate gain, is now hopelessly bankrupt, as you will see by the Paris papers." The character of the management referred to may be judged by the fact that it was copied by such notorious places as the Jardin Mabile, Valentine Falres, Berthras, and other places of like character, which have all failed in their efforts to make this "high pressure" system pay. The effect, however, has been to damage the popularity of the sport in the estimation of the best class of Parisian society, inasmuch as it placed the patronage of the rinks in Paris in the hands of the *demi monde*.

Mr. Plympton furthermore says that, "as a rule, nothing should ever be advertised or announced as connected with roller skating in a popular rink which would cause the most refined lady to blush if asked if she took part in it." His idea—and experience has shown it to be the correct one—is to limit anything of the character of a special entertainment at a roller skating hall or rink to legitimate displays of grace and skill in the illustration of the art itself. He says: "If prizes are to be awarded they should be given for the advancement of that which is most desirable in rink skating, and not for the encouragement of the most rude, dangerous and objectionable features of racing and fast skating."

SUGARING AS A MEANS OF ATTRACTING MOTHS.

THIS subject is brought to the attention of the readers of FOREST AND STREAM with the view of assisting amateur collectors in entomology. Many have a taste and desire to collect, but do not know exactly how to make a commencement, while others are deterred, thinking the labor too great even to make an effort.

Any one who will practice this method will be surprised at the result, and will capture moths entirely new to them, and often in a state so perfect that they will hardly recognize as specimens once familiar to them, having witnessed them previously in a worn condition.

It is known that noctindæ are attracted by the odor of various substances, as the nectar of flowers, the sap which exales from certain trees, honey, decaying fruits, etc., but until within a few years no attempt has been made to bring them to any given location by tempting their taste or olfactories. Since then the study of entomology has been more pleasant, and the science has taken rapid strides under the stimulus of this labor-saving appliance. Entomological books and journals are not accessible to many not making a specialty of collecting. A few general ideas, therefore, may be acceptable, and serve to stimulate many to observe and commence the study of this attractive science, and not only collect for themselves but help others, by exchanging, who are not favored with so rich a location for certain kinds of moths.. It must be remembered that many varieties of insects are extremely local in their distribution, and may be found in one location. This is very noticeable in captures made at Center, N. Y.

In preparing the sugaring the collector is governed by his own experience, and may mix it to suit his own views. After many experiments we have come to the conclusion that equal parts of common molasses and strong beer serves better than any other mixture. We also add a tumbler full of Jamaica rum to every gallon of sugaring. If the beer cannot be obtained, as is sometimes the case in extreme southern locations, water may be substituted, and will answer a very good purpose. The rum is a very serviceable addition, as the odor is transmitted much more strongly than without it.

A laughable circumstance occurred during last summer. A friend who had worked at sugaring somewhat, on taking a vacation, offered to sugar while absent from the city. He had taken pains in the meantime to learn his lesson well, and had cleared up many points in his own mind by many interrogations. His first night's labor, though crowned with success, was fraught with unusual vexation. His mother had desired to furnish the molasses, but by mistake had given him a bottle containing cough syrup. The beer and the nostrum was with difficulty caused to unite, and when the mistake was discovered it was none the less laughable, especially as he had captured several rare catocala (*Relicta* and *Coccinata*), which he did not have the good fortune to attract afterwards in the same location. This circumstance is related to explain to the reader that the operation is not so exact and difficult as may be supposed.

A clean paint or varnish brush is used to spread the sugaring on the bodies of trees, fence rails, or the sides of out-buildings in the vicinity of orchards or timbered lands. Weather beaten surfaces are much better for its application than painted ones. The wet sugar which settles in the bottom of molasses casks is preferred by some rather than molasses; if used it must be diluted as before explained. Moths are attracted by the pomace from cider mills as well as by fruit undergoing dessication and decay. Collectors frequently search bar-rooms in early morning with success, the insects having been attracted thither during the night by the bright light and the odor of the liquors.

Rags may be saturated with the sugaring and attached to trees or shrubbery, or the preparation may be spread on the same with a brush. By visiting the sugared places with lantern and cyanide bottle the noctindæ will be seen around the bait; often they come in swarms. This state of affairs may continue until 9 p. m., when for an hour there will be an intermission. About 10 p. m. they come again, and continue to do so till nearly daybreak. On applying sugaring for a few nights there may be an absence of moths, but by persevering for several nights in succession they are sure to come. When not successful it may be attributable to shrubs bearing oderiferous flowers being in close proximity to decaying fruit; to strong winds, etc. The most favorable time for collecting is just before a storm, as the same rule applies to the capturing of noctindæ as to fishing. The more favorable places for sugaring are forest glades, the edges of timbered lands, or along roadsides and open places studded with underbrush. It is advisable to extend the line of sugaring in a circle. If on the trunks of trees, paint a space within easy reach six inches wide by two feet in length at intervals of ten or twelve feet distant, or even further apart, so that each place sugared can be visited several times during the evening.

The cyanide bottle is very essential in capturing. It is prepared in the following manner: A wide, salt-mouthed bottle should be selected. A piece of the cyanide of potash may be broken up into pieces weighing at least half a drachm each. Six or eight of these are quite sufficient to be placed into the bottom of one bottle. Plaster of Paris should be mixed with water into a paste sufficiently thick to flow easily into another vessel, and poured over the cyanide until covered half an inch or more. The prepared bottle taken in hand and tapped gently upon a table or some level surface will cause the paste to settle between the insterstices of the cyanide, and then should be allowed to remain unstopped for at least six hours, when the moisture will have evaporated, leaving a dry and smooth and hard surface, which will not displace the delicate scales of the insects by contact. The stopper then should be kept in place, except when used in capturing. The cyanide is very volatile, and the plaster of Paris is porous, which readily admits the fumes to pass through it, which completely changes the bottle.

On arriving at a tree, by carefully turning the light on the sugared patch, the collector will be enabled to select such moths as is deemed advisable. The glass stopper should be gently removed and placed over it, when it will drop into the receptacle. By replacing the stopper the insect will be safe until stupefied, when it can be transferred to another bottle prepared in the same way, and allowed to remain until the next morning, when they will be in condition to be carefully examined, selecting such specimens as are most perfect to be placed in position on the preparing board. The cyanide renders the wings rigid if left in the fumes a much longer period than necessary to kill them; but if allowed to remain during the night the same specimens will be quite pliable and relaxed. Care should be exercised in transporting the reservoir bottle so as not to unnecessarily rub the moths, thereby damaging them. Many moths are apparently attracted by the sugaring as soon as they emerge from the pupa, and therefore can be procured by this method in their most perfect condition.

GAME PROTECTION.

N. Y. ASSOCIATION FOR THE PROTECTION OF GAME.—The regular monthly meeting of this Association was held on Friday evening last, at the Hotel Brunswick, Vice President Robert B. Roosevelt in the chair. The Secretary read letters asking the Association to advocate the granting of more power to game constables. From the House Committee on Game Laws at Albany, Messrs. Childs, Gallagher and Tabor were present. The Secretary read a report of the first case tried in Pennsylvania for a breach of the game laws, exposing quail for sale out of season, which did not result in a conviction, as the Judge held that the accused was probably not aware of the fact that the game was offered for sale. Letters were also read asking for a law that would govern the shooting of English snipe and also referring to the wholesale slaughter of deer during the past winter, when they were penned in by snow. Ex-Congressman Clinton S. Merriam said that a large number of deer had been slaughtered in that manner in Oneida, Herkimer and Jefferson counties.

Mr. Austin Corbin was then elected a member of the Association.

Senator Wagstaff spoke of the progress now being made in Albany toward framing a thoroughly efficient game law, and on his suggestion Mr. Brown's bill on the game laws, now before the Committee, was read to the meeting by the Secretary. During the reading of the bill a number of suggestions were made by different members, and on motion of Mr. Fliess, President of the South Side Club, of Long Island, a resolution was adopted to the effect that it was the sense of the Association that in regard to the killing of deer in Suffolk county, the law should be changed to read "that no deer should be killed in that county for the next five years." This was done, as it is understood that there are not more than eight or ten deer left in the county.

On motion of Senator Wagstaff, section 6 of the bill was not approved, as it afforded a rather easy way of evading the law. That section gives dealers in game the right to prove that the game so found was killed during the season or out of the State.

A short discussion in regard to spearing fish brought out various opinions on the subject, and Mr. Roosevelt stated that, in his opinion, it was destructive, as in nearly all cases the fish were speared during the spawning season when in shallow water. Mr. Seth Green's views were also quoted as being very averse to spearing fish being permitted.

Mr. Childs, of the Assembly Committee, then made some remarks, assuring the members of the Association that the Committee were with them heart and soul in endeavoring to frame game laws that would be of permanent benefit to the country. They were divided up into Sub-Committees, and every branch of the subject was being thoroughly investigated. He alluded in his remarks to the views of Mr. Seth Green as to spearing fish, and that spearing could not be carried out effectively against game fish unless when they were in shallow water to spawn. This protection of game was a great thing for the country, and now that our lakes were being stocked with fish and our game preserved, in time of famine we shall have something to fall back upon.

Mr. Tabor, of Buffalo, then gave his experience of what had been done toward the framing of game laws He said he thought the season was really to long, and dealers should not be allowed to sell game a month after the shooting was over.

On motion the Association approved the bill as read, with the exception of section six and the clause allowing woodcock to be shot on Long Island after July 4th.

After business had been concluded the meeting adjourned, and the members repaired to another room where they sat down to a substantial supper and passed a couple of hours in social enjoyment.

CANADA.—The annual meeting of the County of Peterborough Fish and Game Protective Society, was held at the "Huffman House," Peterson, the 1st inst., President Ludgate presiding. The election of officers, etc., for the ensuing year, resulted in the appointment of the following gentlemen:—

President, William Eastland, Esq., first Vice-President; Rev. V. Clement, B. A., Peterboro; second Vice-President, Henry J. Le Fevre, Esq., Lakefield; Recording Secretary and Treasurer, John E. Hammond, Esq.; Corresponding Secretary, C. A. Post, Esq.; Counsel, E. H. D. Hall, Esq. A Central Committee and a General Committee were also appointed, after which Mr. John O'Donnell moved a vote of thanks to the retiring officers, Ex-President Ludgate duly acknowledging the compliment.

Several subjects relative to game protection were discussed in a spirited manner, and the Secretary was requested to communicate with the sister societies of the Province, asking their co-operation in presenting a petition to the Ontario Legislature, at its next session, praying that the present Fishery Overseers may also be appointed, Overseers of Game, in the districts they control, receiving additional remuneration therefor.

The Secretary was also directed to make application to the Minister of Marine and Fisheries for fifty thousand salmon and whitefish fry, to stock lakes in the northern part of the county. Altogether the meeting was a most interesting one, and it is to be hoped the Society has a useful career in the future.

524 WALNUT ST.,
PHILADELPHIA, March 9th, 1877.

EDITOR FOREST AND STREAM:—

As many of your subscribers are members of the West Jersey Game Protective Society, and in all probability would like to know what has been done by the Committee on Game and Fish appointed at the meeting held on the 19th of September last, I send you the following statement of the distribution of fish and partridges made on account of the society, and trust you may think it worthy of publication:—

BLACK BASS.

No.	Distributed in	No.	Distributed in
200	Bargaintown Pond.	300	Egg Harbor City Lake.
200	Hammontown Lake.	100	Bridgeton Pond.
100	Nerchatuxen Stream.	100	Alison Pond.
100	Kirkwood Lake.	100	Crystal Lake.
100	Great Egg Harbor River.	101	Ludlan's Pond.
74	Oldman's Creek.	74	Woodbury Creek.
76	Timber Creek.	74	Raccoon Creek.
40	Abbott's Pond.	400	Mantua Creek.

CALIFORNIA SALMON.

No.	Distributed in	No.	Distributed in
2,000	Tuckahoe River.	560	Timber Creek.
2,000	Alloway's Creek.	2,500	Dennis' Creek.
10,500	Various branches of the Great Egg Harbor River.	2,500	Maurice River.
		3,000	Salem Creek.
1,500	Manina Creek.	2,500	Cohansey Creek.
2,500	Oldman's Creek.	500	Woodbury Creek.
4,000	Mullicas River.		

Eleven thousand escaped into Mantua Creek by an accident to the dam of the pond where the salmon were temporarily kept. The foregoing statement is believed to be rather under the number of salmon actually distributed.

PARTRIDGES.

No.	Birds.	Sent to	Remarks.
180	Partridges	Bridgeton	6 dead.
100	do	Cape May	18 dead.
100	do	Woodbine	7 dead.
144	do	Tuckahoe	50 dead.
90	do	Williamstown	28 dead.
50	do	Swedesboro	2 dead.
50	do	Woodbury	4 dead.
50	do	Paulsboro	9 dead.
50	do	Woodbury	No report.
50	do	Waterford	20 dead.
25	do	Barnsboro	No report.
50	do	Hancock's Bridge	17 dead.
50	do	Seaville	5 dead.
50	do	Leeds Point	7 dead.
30	do	Rio Grande Station	6 dead.
50	do	Wenonah	10 dead.
50	do	Green Creek Station	12 dead.
26	do	Waterford	No report.
25	do	Pitman Grove	4 dead.
40	do	Salem	None dead.
50	do	Hammonton	3 dead.
1310	Total number received.		205 dead.

The number of dead given is the number reported to the committee at the time of the arrival of the birds at their places of destination as above given.

In addition to the foregoing quite an active police system for the observance of the game laws has been kept up, resulting in the arrest and conviction of several offenders. The effect of which has been quite marked.

A MEMBER.

A WORD FROM A POT-HUNTER.

PORTCHESTER, N. Y., Feb. 20th, 1877.

EDITOR FOREST AND STREAM:—

Having for the past two years been a constant reader of your valuable paper, as well as the *Rod and Gun*, I beg to take the liberty of expressing a few of my opinions with regard to the doings of the so-called "gentlemen sportsmen," of which your paper seems to be the champion. There is scarcely a week passes in which I am not stung to the quick by some of your correspondents in their frequent allusions to the men they call "pot-hunters." Now let it be clearly understood that *I* am a pot-hunter, for when a boy I trapped grouse and sold for the paltry sum of

twenty-five cents; but in those days there were no "gentleman sportsman" to use their influence to get laws passed which made that a criminal offence, and I used to look forward with feelings of intense delight for the season to come when we could betake ourselves to the woods and set our traps, and catch perhaps three dollars worth of partridges in one season. Great rascals, were we not? though we caught them on our father's premises.

Well, my brother and I grew up incorrigible pot-hunters; we speared fish; we caught quail under boxes; and, as we grew older, we acquired the art of using the "infernal old spill-out," as your correspondent "B. H. P." styles the common three-dollar shot gun. We have shot at a flock of quail when huddled and killed five or six at one discharge of the "infernal old spill-out;" it was horrible, of course, and we ought to have been sent to prison for it; but as I said previously the fraternity o'clept "gentlemen sportsmen" were not as thick on the ground then as now. As time passed on we became so skillful in the use of this "pop-gun" as to be able to wing grouse at forty yards, even when going at express speed. We enjoyed ourselves to our heart's content, with no one to molest us, no one to interfere; but alas! a change has taken place since the advent of "gentlemen sportsmen" and we can only look forward to the time when the owner of every old "spill out" be taxed yearly, as recommended by "Medicus" in the *Rod and Gun*, for the privilege of keeping one of these infernal machines. I think that Mr. Medicus would find the shores of Albion a more congenial clime for carrying his proposition into effect; but in free America it will never do, and I think it time to get up a counter current, or very soon the "gentleman sportsmen" will have laws enacted which will exclude any person from enjoying this glorious sport who does not own a three hundred dollar gun and a setter worth as much more. I have given a brief outline of the misdoings of a pot-hunter. Now I will give you a sketch of the way in which the "gentlemen sportsmen" I recently met in Maine stooped to secure large bags of fish and game. I was stopping at the time at the hotel kept by Eben Binkley, at Rangeley Lakes, and during my stay of nine weeks I became intimate with many sportsmen from most of our principal cities. This was one of their favorite modes of catching trout. They would lash three or more hooks together, and when they would hot rise at the fly they would grapple them with these hooks, by dropping them under the fish, and jerking them into their bodies. Now, sportsmen, don't hold up your hands in holy horror, for perhaps you have done as bad yourselves, so be charitable. That this was done I can prove, and the guides are ever ready to teach the sportsman this manly art. I do assert that of all the trout taken while I was at Rangeley more than half were taken in this manner, and one of those sportsmen from Massachusetts told me he had taken trout enough that season to nearly balance his account with the landlord. So it seems this Gentleman Sportsman had an eye to profit as well as sport.

I will now proceed to tell you the mode they took to slaughter deer. A party came out from Boston, and brought dogs, and hired guides. They posted themselves in boats on some of the numerous lakes with which that part of the country is dotted, and when the dogs had driven the deer to the water they would run up alongside the helpless victims and place the muzzle of a rifle that would shoot a thousand yards to his head and blow out his brains. I have witnessed this, and by Gentlemen Sportsmen, too. I have seen them take or murder three in one day, and this party of bloods followed up this mode of slaughter for two months, and probably sold venison enough to go a long way towards defraying their expenses. I mention this to show that these so called Gentlemen Sportsmen are as fond of combining profit with pleasure as the boy who snared the grouse.

I would like to know what your correspondent Rusticus could do with the 120 ducks and geese, which he killed in five shots with that field piece of his. Of course he had them served at his table, and may be gave them to his friends; for it is not to be presumed that he would be guilty of selling any.

And now, Mr. Editor, I have come to one conclusion on this matter, and that is, that the true Gentlemen Sportsmen are as scarce as honest politicians, and some of your correspondents who howl about the pot-hunter are in reality the only true pot hunters, according to my definition of the word; and when they cry out for laws to tax every person who keeps a gun, they will find considerable opposition to their selfish propositions. With best wishes for the prosperity of FOREST AND STREAM.

I remain yours truly, C. C. T.

We think that our correspondent makes one little mistake. He attributes the present scarcity of game to the advent of the Gentleman Sportsman. We do not. We ascribe it to the practices of snaring, trapping, and shooting into bevies by himself and others of the same sentiments. Had they been content to shoot their game in the spirit of fairness and humanity which would give even a bird a chance for his life, there might still have been enough for all without those laws which he considers obnoxious. One swallow does not make a summer, and because there are men who kill deer in the water, or catch trout by foul means, it does not follow that the majority of "Gentlemen Sportsmen," by whom we presume our correspondent means sportsmen who depend upon some other pursuit for a livelihood, are guilty of the same practices. —ED.

—A New Hampshire correspondent writes:—

Messrs. Sweat & Keniston, who farm and hunt as a profession away up in the Big Intervale in the remote town of Abany, N. H., got wind of a large yard of deer in the mountains situated in Bartlett and Abany, and froze to upwards of twelve. Sweat brought home two alive and several dead ones. Keniston was seen to have six hanging up in his barn at once. Complaint has been made of this wholesale butchery, which took place after the law took effect on January 1st. The probability now is that the case will be immediately attended to by County Solicitor Buell Carter, who will make it "warm" for these two worthies at the spring term of Circuit Court, which sits at Ossipee.

CLEARFIELD, Pa., March 12th, 1877.

EDITOR FOREST AND STREAM:—

The killing of a large number of deer this winter after the close of the season had the effect of stimulating our sportsmen to some degree, and resulted in the organization of a sportsmen's association, having for its object the protection of all kinds of game and game fish, and the punishment of law breakers, so far as possible. The Association starts out very enthusiastically with a membership of earnest workers, and I have every reason to believe that the cause will not languish in their hands. We have in this section considerable game, but it must be protected from unlawful slaughter if any remains ten years hence. Deer still abound in sufficient numbers to make sport; pheasant or ruffed grouse we have in abundance, but quail are very scarce. Black and grey squirrels are very plenty, we think up here, but it must be acknowledged that the Florida man, who has them at the rate of *fourteen* to the tree is very far ahead of us, though it is not uncommon to find four on one tree I might remark that foxes are plenty, and that an occasional bear is so bold as to show himself within sight of town. JOE.

SALEM, Mass., Feb. 26th.

EDITOR FOREST AND STREAM:—

Reports give some quail yet left, and a fair showing of partridges, but the most outrageous side of this matter is the boldness with which protected game is exposed for sale in our markets, and also the rascally snaring which is carried on in our county, particularly in some parts of Danvers, Middlefield and Topsville. In the last town I am told by good authority that one, Samuel Geddies, snares partridges in the most barbarous manner. I lately saw in our market house partridges exposed for sale that were snared, and the market has policemen in it every day; yet these loud offenses are not taken the least notice of. There are at present strong efforts being made to alter our game laws so that they shall be more effective, but I doubt if any great changes are made, save to abolish summer cock shooting. This is an excellent clause, as if enforced (it will be unusual if it is) it will prevent the shooting of half grown partridges. There is also some talk of increasing the tax on dogs in this State. Our neighboring city of Lynn has the mad dog scare very bad, and all dogs not muzzled by owners are "ketched." I was over to this excited city a week ago, and it was amusing to hear from different ones the numerous ways mad dogs were affected, as by frothing at the mouth, fits, horror of water, etc. One old gentleman said the scare was a humbug. "Why," said he, "they say there has been twenty mad dogs killed in Lynn the past week. Now," said he, "taint so, for 'taint the time o' year for dogs to run mad; 'taint dog days now, is it?" But this will do for once. Hoping might and right will yet unite and triumph on the side of justice, I remain, TEAL.

NEBRASKA.—Both Houses of the Nebraska Legislature have passed a game law, and the one the Governor signs will become law. Regarding the Senate bill a correspondent writes:—

JACKSON STATION, March 8th, 1877.

EDITOR FOREST AND STREAM:—

If any of our eastern friends are not aware that the last Legislature of this State was composed of the "master minds" of the nineteenth century, let them read the enclosed copy of game law they passed and be convinced. If that be not sufficient to convince the most skeptical, let them provide themselves with a copy of our (their) "Grasshopper Act," which says the supervisors shall notify me to perform two days' labor destroying grasshoppers, and may require me to perform twelve days' labor at such time and place as he may deem best, or pay a fine of $10 and costs of suit.

Fancy the fix a man is in. If I don't go and fight grasshoppers I am set to burning off the grass. I may destroy the nest and eggs of some bird, and have a fine of $15 and costs imposed upon me for violating the bird act. If a hawk carry off my chickens, all the comfort I have is, the Legislature gave him the privilege. I am told the Governor has signed both acts, and they are now laws. I claim to be a good law-abiding citizen, but whether the "spirit will move me" to abide literally by these is doubtful. R. G. C.

The law referred to by our correspondent is as follows:—

SECTION 1. It is enacted by the Legislature of the State of Nebraska, that from and after the 1st day of June, A. D. 1877, it shall be unlawful for any person to take, wound, or kill any insectiverous, carniverous, or any other bird within the State, at any season; or to take or destroy any bird's eggs or nest at any time; providing also that this act shall not apply to water fowls.

SEC. 2. Any person violating the provision of Sec. 1 of this act shall be deemed guilty of a misdemeanor, and upon conviction thereof in any court having jurisdiction shall be fined in any sum not less than five nor more than fifteen dollars for each and every bird taken, wounded or killed; and for every bird's nest or egg taken or destroyed; such fine when collected to be paid into the County Treasury for the benefit of the schools; and the person so convicted shall be committed to the common jail of the county until such fine and costs are paid.

SEC. 3. The having in possession any bird recently killed shall be deemed and taken as *prima facia* evidence that the same were killed by the person or persons having in possession the same.

Rifle.

UNACCOUNTABLE MISSES.

THE American long-range riflemen know, too well, what is meant by the word "unaccountables." For the benefit of those who are not familiar with the meaning, however, it can be added advantageously, that it is a term applied to the numerous unexpected and unexplained misses which have occurred again and again to the marksmen who shoot to any extent, more especially to those using breech-loaders. There are many cases wherein the use of this word has been abused. As an illustration of this fact the following may be mentioned in illustration: It might have been noticed frequently on a rifle range, say at Creedmoor, where a competitor's last shot in a long range competition, was a miss. If it had been a bullseye or a center, it would have made him a winner. Generally he will claim that it was an "unaccountable." Unaccountably unsteady would have been better, but to have given this for an excuse would be an additional loss of reputation. But misses *do occur* when there is positively no known reason. All experienced riflemen will agree to that, and it can be easily seen that in getting one of these troublesome customers while in a contest, the competitor is very liable to become perplexed and often unnerved. He not only loses confidence in himself, but in his rifle, when he gets a miss, and feels almost positive that his calculations were correct. Although many plausable theories have been advanced, none are accepted by a majority of those, who should know, as a true solution of the difficulty. There is this fact to be noticed, the "unaccountables" do not happen to any extent while shooting a muzzle-loading rifle. To sustain this assertion a compromise between the scores made by the teams in the competitions for the Centennial trophy and the championship of the world at Creedmoor last year will be sufficient. In this contest the most skilled of the long-range riflemen of the world were present and the world's best rifles were in their hands. As all may know, the Americans were the only ones on the field using breech-loaders, and they made, notwithstanding their supremacy, twenty-two misses. The Scotch had fifteen and the Irish only seven. Out of the Americans number at least *ten* could not be explained by either the unlucky shooter or his "coach." These treacherous shots should be thoroughly "looked after." Their cause should be discovered and the defect eradicated if possible. The long-range riflemen of this country cannot expect to advance any more toward perfection in shooting until they unroot this trouble; the "bane" of so many good chances for excellent scores. There is no reason why this cannot be done. A co-operation between our ingenious riflemen the advancement of theories, both practical and scientific, will perform the object. Working on them if there should be any possibility of obtaining a clue would certainly untie the knotty misses. But where are the knots? Can a miss be caused through a possible defect in the rifle which shoots, on the whole, as "true as steel." In the above mentioned competitions, which are the best known for a comparison on this point the Americans made the smallest number of "inners" and "outers," also making thirty-eight more bullseyes than the Scotch and exceeding the Irishmen's number by fifty. This sustains the belief, taking all into consideration, that the American breech-loaders shoot closer than the muzzle-loaders of the other teams. This is denied on the grounds that the Americans made more misses than the others in the match, consequently their rifles shoot wilder. If it can be proven that the rifles themselves were the cause of the unaccountable misses, there is no more use of investigation on the subject, but this has not been done yet. Some of the various theories are as follows: The rifles and ammunition are all right, but the trouble all lies in the shooter, either through what is called mistaken vision, or in other words, seeing a target where it is not, and thus not hitting it; or else unconscientiously getting a bad "pull off." If this is so, why are those using breech-loaders more liable to err than the others? Then there is another idea removing all blame from the rifleman and his tools and suggesting cause as coming from unforseen changes in the natural elements; such as a change in the wind, temperature, light, density of atmosphere, &c.

There are many known cases where misses have "run all along the line," at one time, through a change of conditions not discernable. But these misses have shown where their cause was to be looked for. The "unaccountables" come in where two men are shooting; one gets an unexplainable miss and the other perhaps a bullseye.

Both of the above theories would tend to prove that the muzzle-loader and breech loader are equally subject to the trouble, which is not so; the breech loader being the recipient of the larger proportion, in fact almost all of them. This fact is acknowledged by the riflemen who have had experience and who are not interested in the manufacture of the rifles. The defect is not supposed as a general thing to be in the rifle itself, but that it exists in the ammunition. The shell tear the paper of the bullet, the paper is torn or creased in putting the cartridge into the rifle's chamber, the bullet has a mar or scratch, it was too heavy or light, or perhaps the powder was a little unevenly weighed; all of these, slight as they may appear to the novice, have a tendency to make a "wild" shot, but they may not happen once in a hundred shots to a careful rifleman. The following is a theory advanced to some extent in England: In the present cartridges used for long range shooting, there is no wad between the bullet and powder and the bullets being of a hard composition do not always expand evenly enough to minimise the tendency of the gases on the instant of ignition to escape past the bullet, without the wad. When the gas does not do so, evenly, "fire cut" will take place, thus producing a wild shot. Here is another theory on bullets, which finds considerable favor among the Creedmoorians: The density or hardiness must agree in proportion to the amount of powder used. Of course there is a limit to the amount of powder and hardness of the bullet. During the first competitions for the selections of the American team last year, several Creedmoor "cracks" shot very unevenly, getting what they called unaccountables. It was discovered that their bullets were two soft for the amount of powder, (ranging from 100 to 110 grains,) they were using, when harder bullets were used in the next competitions the poor shooting was not seen and splendid scores were made by the same parties. There is another idea to the effect, that the various metals used in the bullets do not get sufficiently amalgamated, hence once in a while a soft bullet, or else one which is not equally hard in all parts, and which will not swage evenly in the grooves of the rifle, will be found. In this manner it will lose its proper momentum and prove to be a bad shot.

Many more plausable theories which have been advanced by experienced and reliable marksmen might be added. Only one correct solution is expected and whether it is one of the above or any other, no person has yet discovered, or if he has, it has not been made known. Who will have the honor of hitting the right thing first? Will our champion rifleman give their ideas and experience in regard to the matter? To do so will cause no harm and may be of excellent service to help the other riflemen of his country discover the "why and wherefores." The defect if found out will aid the American riflemen in being more reliable and to continue to hold their own as the champions of the world. ONICKO.

THE IRISH RIFLEMEN.—The Council of the Irish Rifle Association held a meeting on the 22d ult., at the Mansion House, Dublin. The Right Hon. the Lord Mayor was called to the chair. Major Leech stated that the meeting had been called for the purpose of taking action respecting the resolution as to the Queen's prize. Hitherto only Englishmen and Scotchmen, but not Irishmen, were allowed to contend for this royal premium. The meeting thought it ridiculous that Irish riflemen should be debarred from entering a national match which was open to Scotchmen and Englishmen. A long list of peers and commoners attached the weight of their signatures to a document addressed to the British Rifle Association praying that in future Irishmen be permitted to contend for the Queen's prize at Wimbledon.

CREEDMOOR JR. RANGE.—Rifle match between the Journeay & Burnham Rifle Club and Lord & Taylor Rifle Club, Saturday, March 10th. Conditions, teams of eight, 10 shots per man, 100 yards off-hand. The following are the scores:—

JOURNEAY & BURNHAM.		LORD & TAYLOR.	
Name.	Total.	Name.	Total.
McQuillan	41	Redpath	39
Bruyn	38	Chatfield	39
Bonnett	37	Sherman	35
McKune	36	Dalgish	35
Regan	32	Platman	34
Jarman	36	Van Zandt	32
Lockwood	35	Lane	29
Calahan	35	Brown	26
Total	298	Total	294

CANADA.—Our correspondent, at Nelles Corners, Ontario, writes:—

In your journal of February 23d, you show a total for the Fisherville Amateur Rifle Club of 138 points. This should have been 133, as the Selkirk team, making a score of 138, won the prize. The Selkirk team used a Frank Wesson rifle instead of Smith & Wesson. The scores of the Fisherville Clubs show well for the Maynard rifle. G. Nablo, 27; J. Othrman, 29; G. Heid, 26. The Sharp's is behind here. I made a full score of 25 out of 25, at 100 yards yesterday, with Maynard rifle, 35 calibre, and made 43 out of 50 at 100 yards, same rifle and date, yesterday, making 9 consecutive bullseyes out of 12 shots. We are trying to get up another rifle club right here, which will be in force soon. R. M. S.

SOME FINE SHOOTING.—A Syracuse friend writes us that

following: "A few days ago, the new (Warner) system muzzle-loading rifle was fully tested on the Syracuse Rifle Range. The weather was certainly not favorable for fine shooting. A strong wind was sweeping across the range, and besides the deep blinding snow made the sighting difficult; still, under these most unfavorable circumstances, the shooting was excellent. At one thousand yards, the gentleman who shot this rifle made eighteen bullseyes in twenty shots. This same party added a telescope to the rifle, and shot at two hundred and twenty yards, ten shots, string measuring, from center of bullseye to center of ball, in all 7¾ inches. According to the shooting of this new system rifle, the breech-loading men must look to their laurels next spring. The rifles are made by Messrs. Nichols & Lefever. G.

RUSSIANS AT THE TARGET.—A San Francisco correspondent sends us the following score, made by Commander V. Terentieff, of H. I. R., the gunboat Gosnostai, at one thousand yards, off hand, in eighteen shots: 3, 5, 3, 4, 5, 5, 5, 5, 5, 5, 5, 4, 4, 4, 4, 4, 5. Total, 80 out of a possible 90. Five hundred yards, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 4. 4. 4, 5, 4, 5. Total, 86 out of possible 90, made at Smith's Forest Gallery, San Francisco. We were not aware that they had a one-thousand yard gallery, or even one of five hundred yards in San Francisco.

RIFLE NOTES.

The Executive Committee of the N. R. A. is preparing a programme for the spring meeting, usually held in May, at Creedmoor. It is to be submitted at the next meeting of the Board of Directors.

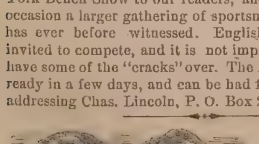
The California Rifle Association will hold their spring meeting at San Bruno. It will probably take place during the month of May.

The Long Island Railroad Company agree to reduce the fares for members of the N. R. A. and the National Guard to Creedmoor during the coming season. The charges are said to be reduced to thirty-five cents a round trip, which is almost too good to believe.

Gen. T. S. Dakin is greatly in favor of inviting an Imperial team to come and shoot against us.

The patent on the breech action of the Sharp's rifle has expired.

Gen. W. E. Strong, of Chicago, is in this city. He is a "crack" shot gun and long range shot, being one of the best marksmen of the Dearborn range. This is the range represented by J. A. Shaffer in the competitions for the selection of the American team.



The next annual meeting of the Irish Rifle Association is proposed to be held at Dundalk. The association has been offered better facilities there by the residing gentry than at any other place.

TO PRESERVE A RABBIT SKIN.—Tack the skin quite as tightly as you can stretch it on a board without tearing it, and wash it with a solution of alum and water. Of course the fur side is tacked next the board, and the solution used on the other side.

The Kennel.

THE NEW YORK BENCH SHOW.

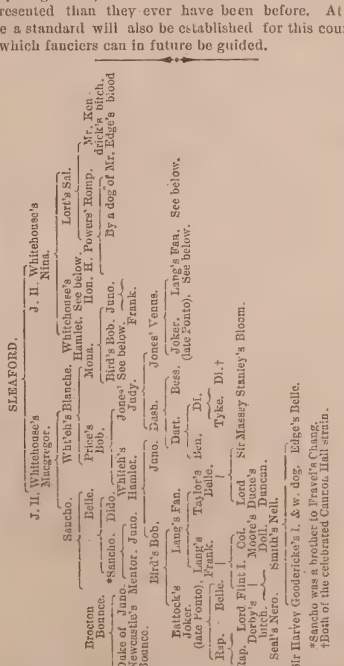
It is with much pleasure that we announce a Bench Show of Dogs, to be held at Gilmore's Garden (the Hippodrome), in this city, on May 8th, 9th and 10th. The show will be held under the auspices of the Westminster Kennel Club, a Committee having been appointed to attend to the details, and Mr. Chas. Lincoln will act as Superintendent. The prize list will be on a much larger scale both as regards the number of classes and the value of the prizes than has been customary at any show heretofore held, and all cash awards will be paid in *gold coin*, a capital arrangement, as any gentleman having prejudices against contending for money, may, if he wins, have the face of his coins plaued down and convert them into medals. There is no place in this country, and probably in any other, which is so admirably adapted for the purposes of a Bench Show as Gilmore's Garden. The judging will be in public, and on the immense band stand in the center of the ring, where Gilmore's one hundred musicians found room. The judges have not yet been named, but the Rev. J. Cumming Macdona has been invited to visit us and act as advisory judge, and he will probably accept. This will be particularly valuable in assisting us in establishing a standard for certain classes which have hitherto not received much attention, but which will be very fully represented at the forthcoming show. We allude to the St. Bernards, mastiffs, etc., among the larger classes and the skyes, dandies, pugs, etc., among the smaller. We commend the New York Bench Show to our readers, and hope to see on that occasion a larger gathering of sportsmen than this country has ever before witnessed. English breeders have been invited to compete, and it is not improbable that we may have some of the "cracks" over. The Premium lists will be ready in a few days, and can be had from this office or by addressing Chas. Lincoln, P. O. Box 2,832.

Our junior illustration this week represents a pair of liver and white cocker spaniels, Captain and Flora, the property of Mr. M. P. McKoon, of Franklin, N. Y. They are "blue bloods," being bred from very fine imported stock.

☞The "Only Illustrated"!!!

NON-SPORTING DOGS.

Our object in this article is to draw the attention of those who are interested in the canine race, also those who would like to be, and are not what are generally termed sportsmen, to the faithful animal—the non-sporting dog. We propose, as circumstances will permit, to publish from time to time the portraits of the most celebrated dogs in their classes of the day, giving a short history as to breeding and their supposed origin; also the "Club points" as they should be judged on the show bench, and other interesting matters.



Our Register for pedigrees is open for all breeds, classes, and distinctions of the canine race, so as to take the word Kennel in its most comprehensive form, and not be confined to the pointers and setter classes and other sporting dogs.

There are a large number of gentlemen who are not field shots, yet who take a great interest in and propose to pay some attention to the rearing and breeding of non-sporting dogs. During the last year we have received quite a number of letters from prominent persons, who assure us that they intend to be very particular in the selection of dogs, and have asked us to give the latest information, so that they can choose the proper and most fashionable type of animal. People may say, what is the object to be attained by this new excitement in dogs? We answer: fancy and amusement; the latter being about the most essential thing, and something which all people resident of large cities require. Taking the word amusement in its proper dictum, it is perhaps the most satisfactory "exhilirator" of the day. An old story, but nevertheless true, is that that the dog is the companion of man, and we are not quite sure but that the animal does not make better men of us. What handsomer sight is there than a gentleman taking his morning walk, accompanied by a majestic St. Bernard, a noble mastiff, or a clever Newfoundland, or again, if his fancy dictates, the gamiest, most beautiful and symmetrical animal of the day—the fox terrier.

The breeding, handling, and educating any of the large variety, known as the terrier class, is in our opinion one of the most pleasurable of recreations. Just look at the wonderful endurance and intelligence of the bull terrier, the Bedlington, the wire-haired, not forgetting those grand little rascals the skyes, dandies and Scotch—with the courage of tigers, and yet as diminutive as rats.

In introducing this new matter to our readers, we shall take great pains to obtain the best and most reliable information from the many canine societies of England and elsewhere, and at all times will be pleased to place any of our friends who anticipate purchasing dogs in correspondence with the clubs which make an individual class of animal a specialty.

At the forthcoming Bench Show of the Westminster Kennel Club, which is noticed elsewhere, fanciers of the non-sporting classes will have an excellent opportunity of comparing notes, as those classes will be more largely represented than they ever have been before. At that time a standard will also be established for this country, by which fanciers can in future be guided.

SLEAFORD.—We give this week a portrait of the liver and white pointer dog Sleaford, imported from Mr. Whitehouses' kennel by the St. Louis Kennel Club. Sleaford took first prize in the small pointer class at the recent Birmingham Bench Show.

—Mr. Burdett Loomis, President of the Connecticut Stock Breeders Association of Hartford, purchased while on a visit to Switzerland some fine St. Bernard's. He is also a fancier of the smooth-coated variety.

A RAT-TERRIER CATCHES A WILD CROW.—Many of our readers will recollect the account published in this paper some two years ago of a sharp little rat-terrier named Joker, the property of Miss Cora E. Peirce, of "Aquadale," Wenonah, N. J., the fish farm of Capt. Peirce, the South Jersey fish culturist. Besides catching immense numbers of mice and rats, Joker has caught several musk-rats, weasels, opossums, rabbits, and stranger than all, scores of large eels, plunging into the water for them, though his general aversion to water is scarcely equalled by a cat. But the crowning feat of this little dog was performed on Tuesday, March the 5th. At Aquadale whenever a fish dies it is thrown upon a compost heap near the ponds. During the past winter an old crow has become emboldened by the pangs of hunger, to make numerous visits daily to the compost heap to secure a meal of fresh fish. Whenever little Joker saw the crow alight he would give chase. At first the crow was very wild and would generally fly out of sight, but hunger finally emboldened him and after a few weeks he would only fly lazily to some neighboring tree, Joker keeping directly under him, and barking till he changed base. Of late the crow would not fly till Joker was within a few feet of him, and then barely keep out of his reach. A crow is generally accounted a pretty good calculator of distance, but this over confident specimen at last miscalculated and while flying apparently about five feet above ground the nimble little Joker sprang up and caught him and shook the life out of him as quick as if he had been a rat. Miss Peirce has prized her pet dog highly as being a safeguard for her chickens as against weasels, and now thinks that he may be inclined to look after hawks "and such."

THE KENNEL REGISTER.—List of dogs whose pedigrees have been entered in the Kennel Register for the week ending March 12th:—

SETTERS	
Grouse—Black and white; W. B. Sutton.	Gipsey—Red with white, do Jamie—Black and tan. do Nellie— do do
Duke of Orange—Red; T. A. Fowler.	Susan— do do
Dash—Black and tan; J. T. Walker.	Quince—Orange and white; Dr. C. A. Kitchen.
Topsy—Black and tan; John Gillelan, Jr.	Kate—Orange and white; J. W. Shultz.
Prince—Black, tan and white; Dr. Henry McKiderry.	Artful Dodger—Red; S. J. Hughes
Don—red; J. C. Hobagh.	Flasher—Black, do. Nancy—Black. do.
Bertha Von Hillern—Orange and white; Ethan Allin.	Zip—Red; Chas. Riley.
Black Bess—Black; James T. Walker.	Jocko—Black, tan and white; J. Von Lengerke.
Gwendolin—Black, tan and white; C. A. Cowles.	America—Lemon and white; do Leda—White and black; J. Von Lengerke.
Tom—Black and white; J. Arthur Beebe.	Nellie—Red; J. T. Allyn.
Chevy—Orange and white; J. Arthur Beebe.	Jess—orand white; Dr. W. H. Daly.
Countess—Red; H. B. Vondersmith	Fairy II—Lemon belton do
Dash—Red; L. A. Montagne.	COCKERS.
Irene—Red; P. H. Morris	Fannie—Liver and white; J. Otis Fellows.
Kirkman—Tan; F. D. Shaw.	

—We print this week the abstract of the third one hundred pedigrees registered. The object of printing this table is that any errors or omissions may be rectified, and thus save considerable correspondence in preparing the Stud Book

GUY.—Can any of our readers supply us with information regarding a dog named Guy, the property of J. H. Roberts; by whom bred, color, and when whelped? We have a pedigree of this dog, by Ilys out of Flora, but it is wanting in all the above particulars.

ELCHO.—This grand specimen of the red Irish setter has been purchased by William Jarvis, Esq., of Claremont, N. H., as a fitting mate for his Kathleen. We hope to see both Elcho and Kathleen at the New York Bench Show, and their genial owner as well.

—The following bitches have visited the St. Louis Kennel Club's stud dogs Demuth's Kate, to Rock, Mr. Cohane's Gordon bitch and Henry Griffith's imported Irish bitch Fan, II, to Erin.

—Mr. Charles Riley, of Albany, N. Y., claims the name Zip for his red Irish setter by Tuckerman's Don out of Pearl, instead of Rip, as printed by us last week.

—Mr. Geo. F. McCleane, of Pittsburgh, returned from Europe, on the steamer Germania, on Saturday last. Mr. McCleane, while in England, purchased from G. de Londre Macdona, Esq., the setter bitch Pera by Blue Prince out of Rhoda by Dan-Rhoda. Pera was in whelp to Mr. Macdona's Ranger, and on the voyage whelped eight puppies, of which one-half are dogs. They are nearly all marked like their sire, white with black about the head. One bitch is all white, and to her Mr. McCleane has given the name of White Star, in honor of the steamer on which she was whelped. Regarding Pera Mr. Macdona writes us as follows:—

LIVERPOOL, March 1st, 1877.

EDITOR FOREST AND STREAM:—

I have just seen off on board the Germanic, steamer, Mr. McCleane, of Pittsburgh, with my first prize English setter bitch Pera, due to whelp to champion Ranger on March 11th. Should all go well, soon after her arrival upon American soil, she ought to present to your country as grand a litter of pure English setters as ever were whelped. She is a daughter of Mr. Laverack's Blue Prince, out of Mr. G. Lewe's Rhoda. Rhoda by Mr. Statter's Field Winner Dan, (sold to Mr. Llewellin, for £300) out of Mr. Llewellin's Rhoda. Mr. McClean had the option of purchasing Pera or Magnet, that ran in the puppy stakes at last Field Trial Derby, at the price advertised, £75, but chose to risk the bitch in whelp. Champion Ranger, I am happy to inform you, is in grand spirits and strength, and is now in training to compete again for the challenge cup and other prizes at the ensuing Field Trials in April and May next. This grand dog the hero of many a well fought fight will lead his competitors many a merry dance yet. I am yours truly,

G. DE LANDRE MACDONA.

—Mr. John Jackson, of Hunenberg, Virginia, has presented "Don" by Foreman Taylor's one-eyed "Sancho," to Mr. Tom Epps, of North Carolina.

ABSTRACT OF THE PEDIGREES OF THE THIRD 100 DOGS ENTERED IN THE KENNEL REGISTER.

IMPORTED POINTER SLEAFORD.

THE MAINE DOG LAW.—The last Maine Legislature passed a law requiring that all dogs should be licensed, and wear a collar with the owners name and the registered number thereon, the fee for same being one dollar for dogs and two dollars for bitches. For keeping a dog not registered the fine is $10, and the dog may be killed by any constable. The owner is protected by a clause which says: Whoever wrongfully removes the collar from, or steals a dog licensed and collared as aforesaid, shall be punished by a fine not exceeding twenty dollars; and whoever wrongfully kills, maims, entices, or carries away such a dog, shall be liable to the owner for its value. It is a pity we have not such a law in this and adjoining States, only we should like to see the fee at least $5, for a bitch.

GAME TO THE DEATH—An old fox-hound belonging to Bradbury Bennett, of Amherst, followed a fox from Saturday morning to Monday morning, and then lay down and was chilled to death. He was a tender-footed dog, and blood followed at every step, and his feet were badly worn off. The running was most of the time on Joe English Hill. Peter W. Jones saw him running Saturday morning, and heard him at intervals through the night.

Stranger than this, a hound puppy, one raised by Al-Sturtevant, of this city, followed close to the old dog all the way, bu owing to his youth and stronger vitality, stood the forty-eight hours' run and then stayed with the dead dog forty-eight hours longer, refusing to let any stranger come near him. His master was sent for and came and got him Wednesday morning.

Peter W. Jones gives us the details of the story, leaving no doubt of the forty-eight hours' run; but it is probable the puppy went-off and got something to eat during the remaining forty-eight hours in which he guarded his dead companion.—*Manchester, (N. H.) Mirror, March 1st.*

PENNSYLVANIA.—Our correspondent at Greenville, Pa., writes us that "at the regular meeting of the Greenville Sportsmen Club, A. F. Henlein, Esq., was elected Attorney for the Club. H. T. Blair, Superintendent of S. & A. R. R., was elected a member, also Hon. William Achre. The Club is in fine condition financially. The members are looking forward for lots of sport the coming season. Capt. Nelson's Gordon setter dog Dash, has been missing for a couple of days, and the Captain is fearful that he has been foully dealt with. He, the Captain, has another fine Gordon. The sire is from Mr. Pape's Kennel, England. Mr. Pape makes a visit occasionally to Huntsville, Ohio, and is the guest of Judge Ingals. He presented the Judge with a beautiful black setter, which he uses for stud purposes. M. H. B.

—Mr. Leroy Collins, of Lancaster, Mass., has imported from the Rev. J. Cumming Macdona's kennel, some splendid specimens of the St. Bernard. He is breeding the smooth-coated dog.

—Mr. Frank D. Shaw claims the name Kirkman for a tan setter dog, whelped December 19th, 1876, by Mr. Geo. Colburn's Dash out of Mr. E. Yards, Jrs. Fannie. Mr. P. H. Morris claims the name of Irene for a red bitch out of the same litter.

—Mr. F. A. Diffendorfer, of Lancaster, Pa., writes us that his bitch Bess, dam of Begorrah, whose portrait we published last week, has visited Mr. Miley's imported red Irish setter.

—Mr. James T. Walker, of Albany, N. Y., writes to claim the name of Black Bess for his bitch puppy by his Dash out of Bennett's Mab. The name of Black Bessie was claimed last year by Mr. F. W. Jones for his natige English setter, and is so entered as No. 198 in the Kennel Register. Perhaps Mr. Walker will now choose another name, if he thinks these are too near alike.

—Captain Taylor's sheep dog "Demon," by Robbie out of Ellie, both Rossbire collies, has visited Mr. Halett's imported collie "Don."

Yachting and Boating.

SEAWANHAKA YACHT CLUB.—The second regular meeting of the Seawanhaka Yacht Club was held at Delmonico's on Monday week, Commodore Colgate in the chair. The Chairman of the committee appointed for the purpose reported that no change is advised in the course for the open boat races.

The Chairman of the committee to report upon the vexed question of time allowance and measurement said that the present table of allowance is very unjust in all cases, and the committee, together with many members of the club, are of the opinion that the remedy is very difficult. The committee have found, however, that a system based on the gradual increase of a parabolic curve is only one which will give the correct allowance between yachts, varying slightly, and recommend that plan. In order to give all members an opportunity to be heard on the important subject the committee advised that it be postponed until the next social meeting of the club, when each member be allowed five minutes to give his views, the Commodore having the power to extend any speaker's time to fifteen minutes. The motion was carried.

The committee presented the following programme of races and regattas for the current year;—

Many members seemed to think that this list would entail too much expense on the club, while undoubtedly making a brilliant season, and finally, on motion of Mr. Center, the fifth and sixth races—the Ladies' Day and the September open boat contest—were stricken out, when the balance met with universal indorsement. It was also agreed that if in the Corinthian race, June 16th, the second class schooner event should not fill, the Regatta Committee must appoint another day for the race to take place.

NEW YORK YACHT CLUB.—Pursuant to a call a special meeting of this club was held on Friday evening at the rooms, corner of Twenty-seventh street and Madison ave., sixteen yacht owners being present. The question which has occupied the attention of the members of the club for some time past, whether the club should relinquish its club rooms in the city, was the only theme discussed at the meeting last night. The consideration of this important subject kept busy the gentleman who were present. Commodore S. N. Kane, of the schooner Restless; Mr. T. B. Asten, of the schooner Clio; and Mr. Guiteau spoke in favor of rescinding the resolution adopted at the last meeting to give up the Madison avenue club house, and Mr. S. J. Colgate, of the schooner Idler, and Mr. Wm. Krebs, of the Regatta Committee, made addresses upholding the resolution passed at the previous meeting. When the question was put whether or not the resolution should be annulled, it was decided by a vote of 12 to 4 to retain the New York club rooms. The question of retaining the Staten Island club house did not come up. Before the meeting adjourned it was decided to hold a social dinner at Delmonico's on the 21st inst. No other business was transacted at the meeting.

WILLIAMSBURGH YACHT CLUB.—The annual meeting of the Williamsburgh Yacht Club was held on Friday evening last, at the foot of Dupont street, Greenpoint. There was a very full attendance of members, and after the transaction of routine business, the following officers were elected for the current year:—

Commodore, T. W. Reeves; Vice-Commodore, Jacob Schmidt; Rear Commodore, W. H. Bullard; President, E. S. Zoble; Secretary, C. E. Mielke; Assistant Secretary, W. H. Bardell; Treasurer, Henry Miller; Measurer, J. A. Brush; Judge Advocate, Henry Messinger; Trustees, N. Lockwood, R. H. Nash, A. Lubbers, Robert Place and F. Thorne; Regatta Committee, H. Coleman, D. O'Brien, A. Finehout, J. Van Brunt, and W. Davis; Steward, J. Northrop; Sergeant-at-Arms, W. H. Waters.

The Secretary presented a report, showing that the financial condition of the Club was all that could be desired, its assets amounting to $3,500, while its debts do not exceed the sum of $47.

ROCKAWAY YACHT CLUB.—The annual meeting of the Rockaway Yacht Club was held on Tuesday last, and the following officers were elected for the ensuing year:—

President, N. Jarvis, Jr.; Vice-President, Alexander H. Stevens; Treasurer, Alfred Neilson; Secretary, Henry H. Man; Commodore, Daniel Lord, Jr.; Measurer, N. T. Lawrence; Regatta Committee, Daniel Lord, Jr.; William Lummis and Charles A. Cheever.

The Club is in an exceeding prosperous condition, and has enrolled in its fleet some of the fastest open boats owned in the vicinity of New York. Since its last annual meeting the Club has become incorporated, and it is now entitled to a place among the other yacht clubs, for although organized as recently as 1871, it has constantly added to the number of its members and the reputation of its boats. The annual regatta is held in the month of August, and is always a feature of the summer season. The Club also intends continuing a custom, inaugurated with great success last summer, of evening receptions at the Club-house. The Club has recently adopted new sailing regulations, by which all races sailed under the auspices of the Club are to be entirely Corinthian.

THE GOLDEN GATE YACHT CLUB.—At the annual meeting of the Golden Gate Yacht Club, held on Monday evening, Feb. 19th, 1877, the following officers were elected for the ensuing term:—

President, Thomas D. Riordon; Vice President, Robert Wheeler; Secretary, Joseph Schmidt; Treasurer, Charles Hug; Commander, A. M. Jennings; Vice Commander, Frank Farey; Auditing Committee, Emil Meyer, E. Erzgraber, and George Hoar; Investigating Committee, Jos. Schmidt, Conrad Hubner and Theo. Van Bergin; The club will open its yachting season of 1877 with a grand yacht excursion on Sunday, April 8th.

HARLEM REGATTA ASSOCIATION.—The annual meeting of the above association, which is composed of delegates from the principal boat clubs on the Harlem River, met last week at Knickerbocker Cottage in Sixth avenue. The meeting was called to order by the President, Mr. F. G. Brown, of the Nassau Boat Club. Each club in the association was represented by three delegates:—Messrs. King, Clarke and Ackerson, the Atlantas; Knowlton, Barnett and Rathbone, the Athletics; Goodwin, Sage and Boyd, Columbia College; Peckwell, Loutrell and Freeborn, the Dauntless; Mills, Reade and Meyers, the Nassau; Neville, Childs and Levien, the Nautilus; Kelly, Belmont and Rives, the New York, and Leland, Starr and Peters, the Stock Exchange.

The annual report of the Secretary and Treasurer, Mr. C. G. Peters, gave a very flattering account of the progress of the association during the past year. All the indebtedness of the organization has been paid off and the assessments levied on each club returned. Even with these drains on the treasury there still remains a balance on hand for the present year of $173 15.

The following gentlemen were elected officers for 1877:—President, J. T. Goodwin, Columbia College Boat Club; Vice President, R. L. Reade, Nassau Boat Club, Secretary and Treasurer, Edmund Kelly, Stock Exchange Boat Club. The above named delegates, together with John King, Atalanta; G. T. Barnett, Athletic; M. Freeborn, Dauntless; R. L. Reade, Nassau; R. L. Neville, Nautilus, and G. L. Rives, New York Rowing, were elected members of the Executive Board.

The date of the annual regatta was not fixed, but it will take place, in all probability, between the 15th and 30th of June.

NEREID BOAT CLUB.—A meeting of the Nereid Boat Club was held on Thursday evening last, at the residence of Mr. Joseph P. Earle, Columbia Heights, to adopt a programme for the boating season of '77. The following officers have been elected for the ensuing year: Captain, Jos. P. Earle; Lieutenant, Heywood C. Brown; President, Chas. R. Flint; Vice President, W. D. Johnson, Recording Secretary, James C. Bergen; Corresponding Secretary, H. R. Post; Treasurer, F. B. Rogers; Auditor, Wm. Wise, Jr.; Chairman of the Investigating Committee, E. F. Nichols, which officers with James L. Gladwin, comprise the Board of Directors.

Last evening the following gentlemen were elected active members: Messrs. H. B. Beecher, A. H. Watun, Seelye Benedict, Wm. E. J. Fales, Horace C. Hardy, Jno. B. Phillips, Chas. W. West, William S. Gould, Geo. Post, J. Morran and Henry E. Nesmith, Jr.

Wm. M. Ivins, Jr. and Francis Lanton, Jr., were appointed a committee to revise the constitution and by-laws. To accommodate the increased membership, a second story is to be put on the present boat house. The plans prepared by Mr. Chas. W. Clinton being completed the work will be commenced at once.

Although the present fleet of the club numbers eleven boats with a capacity of seating 58, two new four-oared gigs have been ordered to be ready for the spring regatta.

In response to indications from the N. Y. Rowing Club of their desire for a friendly contest, it is anticipated that they will be invited to a social race, which will be an additional pleasure of the spring regatta.

As usual the float will be put in the water the beginning of next month. The membership of the Nereid is limited to 63, being besides 53 active honorary and honorary members who have been active boating men of the Nereid for three years or more. The property of the club is unencumbered and the club is out of debt.

BOSTON YACHT CLUB.—An informal meeting of the Boston Yacht Club was held March 10th, Ex-Commodore Barnard in the Chair. The object in calling the meeting was to arrive at some arrangements to please the non-yacht-owning members of the club and to promote its greatest prosperity. The following Resolution was adopted:—

Resolved, That in the sense of this meeting the Boston Yacht Club should commence the season with an early regatta, followed by a dance in the evening, to be succeeded by a series of monthly or semi-monthly entertainments, consisting of four to six festive occasions or picnics, which should be managed under the supervision of a special committee, composed of the House and Regatta Committee.

A resolution presented by Wm. F. Halsall, Esq., that the sailing regulation allowing shifting ballast be abolished met with general approbation.

A resolution presented by Chas. Russ, Esq., altering the by-laws preventing yachts participating in regattas unless owned entirely in the club also received unanimous support.

—At a Texas baby-show it was a long time before any one could be found to act as a judge. Finally five brave men were found to act, on condition that the awards should not be announced till the judges had ten minutes' start. The mothers sat in a circle, babies in lap. The judges made their rounds, compared notes, handed the result to the spokesman, and ran for their lives.

—The most difficult gun to keep clean—A fouling piece.

—Men talk about the idle wind, but the wind is always busy, and, like a cheerful farmer, whistles at its work.

—Peaceful sleep is the sheet anchor of health.

—"Business is picking up," as the chiffonier said.—*Philadelphia Bulletin.*

New Publications.

The *Naturalist* for March seems to us not quite up to its usual standard; for although several of the articles are of great value, there are others which are not so satisfactory.

L. F. De Ponetales contributes to this number one of its most interesting articles, entitled "Hints on the Origin of the Flora and Fauna of the Florida Keys," an essay which will prove very attractive to all who read it, but especially to those who have visited these little-known Islands. Another article of great importance is that on "Geographical Distribution of Animals," being chapter xvi. of Prof. A. R. Wallace's recent work under that title. In addition to the papers above mentioned are "A Few Words About Scavengers," by Prof. Tenney, "On a Provisional Hypothesis of Salutory Evolution," by W. H. Dale, "A Provisional Hypothesis of Pangenesis," by W. K. Brooks, and "Traces of a Voice in Fishes," by Dr. C. C. Abbott.

The General Notes are full, and the anthropological news especially important and interesting.

"The bitter past, more welcome is the sweet," sings the bard of Avon. This accounts for the rush for the new toilet article, B. T. Babbitts Toilet Soap. The world has begun to realize that ordinary scented soaps are dangerous, and that this new toilet soap, with its purity, sweetness and emollient softness, is not to be disputed as the perfection of its kind.—*Adv.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

LYMAN'S PATENT
BOW-FACING ROWING GEAR

A Revolution in Boating.

With this rowing gear the oarsman faces forward instead of backward, pulling in the same manner as with ordinary oars. The stroke is longer and much easier than with any other oar. The boatman makes no more effort in steering than in directing his course while walking. The oars can be shipped instantly by Closing them upon the gunwale of boat or entirely detaching them. This oar is especially adapted to all kinds of pleasure boating, and is indispensible in duck shooting.

For Forest and Stream.

"BIDE A WEE."

THE sun is coming north once more,
The wintry days are almost over,
Spring shyly loiters at the door,
With smiles and tears, as aye of yore;
And breath of buds, and clover.

Slowly the snow-drifts melt away;
And prison'd streams will soon be singing;
Then balmy airs will kiss the day,
And bees will hum o'er meadows gay,
While birds are homeward winging.

Then shall the forest put aside
The sober hues of days long cheerless;
Dew-crested flowrets, far and wide,
Will gleam with jewels for the bride,
Who comes in beauty peerless.

Her smiles bring dimples to the lake,
And grave old hemlocks nod a greeting,
The timid deer, their haunts forsake,
And through the dells, their run-ways make,
Where crystal brooks are meeting.

Now tempted by the wooing sun,
The lusty trout again are roaming,
The angler's trysting time begun,
When round the camp fires, one by one,
Friends gather in the gloaming.

T. W. A.

For Forest and Stream.

My First Bull-Moose.

THE appearance of the FOREST AND STREAM, in its attractive, new dress, exhibiting antlered head of the grandest member of the deer tribe, in the midst of various scenes characteristic of the pursuits in flood and field that carry joy to the sportsmans heart, brings to my recollection the occasion when I first met and conquered the full-grown, lordly bull-moose in his northern home.

The methods of approaching this great deer vary according to the season of the year, or the particular locality in which it may be at the moment. Floating at night when the moon is shining is practised during the summer. Hunters state that it is not safe to carry a jack, as a wounded moose will attack a boat if it bears a light. In the autumn the bulls are called to the place where the rifleman has taken his position, by imitating the peculiar cry of the cow, with a horn made of birch-bark; or else still-hunted by following their tracks in the soft ground and amid the swamps, or on the light snow. And in mid-winter they are sought for in their yards, where they are helpless either to defend themselves or to escape, as the snow being deep with a thick crust the heavy animal breaks through with its sharp hoofs and is soon overtaken by the hunter on his snow-shoes. The first and last of these methods, it seems to me, should not require any lengthy appeal (in these days when our large game is being improved so rapidly from off the face of the earth), to persuade all worthy of the name of sportsman to renounce entirely—nay more, to give their earnest assistance in having laws passed to prevent every one from killing any species of deer at such seasons, *and then seeing to it that the laws are enforced.*

Before proceeding with my narrative, let me in a few words show why these two methods are thoroughly unworthy of the sportsman, if indeed there may be any such to whom the reasons are not already sufficiently apparent. During the summer when floating is practicable, it is chiefly the cow or doe (as the species may belong either to Alces or Cervus) that come down to the water, and then they are either with young or else the calves or fawns are hidden away in the woods to await the mother's return. Should she perish at the water's side, the unborn young perish with her, or else those left in the forests must slowly starve to death as they are generally not old enough to take care of themselves, and in this manner, the species becomes rapidly exterminated. If, on the other hand, it is a bull or buck that is shot, it will usually be a young one, lean in flesh, with the horns in the velvet, and so the much desired trophy cannot be preserved with any satisfactory results. I contend that none of the above facts can bring any pleasant recollections to the mind of a true sportsman. I remember once going in the early part of September to a chain of lakes in the Adirondack just north of Racquette Lake, and that our party were unable to pitch their camp in several places determined upon, on account of the stench that arose along the shore from the putrid carcasses of the deer lying all about. During the month of August, there had been encamped around the lake a number of sportsmen!!—heaven save the mark!—and they had slaughtered the deer, chiefly does, as we could see from the skulls, to such an extent that the place was full of their carcasses, and the pure air of the wilderness had become more like that of the charnel-house. No, my fellow-sportsman, ye who are worthy of the title, and delight in the exhilarating pleasures of the chase, regarding the beasts of the field and fowls of the air as among those good gifts to man to be used and not abused, help with all your might to do away with deer-hunting during the summer-time, so that all such useless slaughter may be effectually prevented, and that it may, together with wood-cock shooting at the same season of the year, soon be among the things that were. For the last method, slaughtering the helpless moose in the yards or in the deep snows, I do not believe words of mine are necessary to cause every one, who is not a savage, to condemn and execrate any person who could be guilty of that kind of murder. But yet it is a sad truth, that killing these splendid animals in this way has been the main cause of their complete extermination in many localities, and of their rapidly becoming scarce in others. The Canadian authorities did well to prevent all persons from killing moose in Nova Scotia for a certain number of years, for they were fast disappearing from their haunts in that Province, but the Government would do still better if, now the end of the close time is approaching, they would extend it for another similar period, for it takes a moose several years to arrive at its prime, and there must be a disproportionate number of young animals among those now roaming over the northern pasture grounds. But having made a wider digression than I intended, let me come back to the narrative I started to relate, though I cannot feel that many apologies are needed, for I am happy to see that the preservation of our game of fur, fin, and feather is attracting the earnest attention of the best among us all over our land.

It was, then, toward the latter part of September, 18—, that three of us, with an equal number of guides, were encamped upon a swift running stream in the central part of Nova Scotia. Such a country as it was to hunt over, and probably is to-day, I never before had seen. The woods were few, and chiefly in and around swamps, where you sank all the way from your ankle to your waist, as you were heavy or light. The remainder of the country was, I believe, called "barrens," and barren it certainly was of any *upright* trees, but to make up for this there were plenty of them lying down and over each other in all manner of perplexing positions, while beneath their interlaced branches and recumbent trunks the granite rocks lay at all imaginable angles, chiefly with the sharp side up. It was quite a relief to arrive at any place freed of tree trunks and be able to walk over the rocks only, the sensation experienced being similar to that one would feel on leaving a corderoy road for a wooden pavement. It was over and through such grounds as this we were to hunt the moose, and it was to be chiefly by tracking them, for but little calling had been resorted to as yet, it being deemed rather early in the fall to render that method successful. Be sure, my reader, it was no work for any one not possessed of plenty of muscle and endurance, to follow the Moose in such a country. We had to stride over the prostrate limbs, lying frequently two or more feet above the rocks below, balancing ourselves upon the sharp point of some upturned stone, or on the shaking branch of a tottering trunk, all the while fearful lest some limb might crack beneath us, and warn the wary deer of our proximity. By the time we reached our camp in the evening after a day's tramp, we would be quite content to lie down and drop the rifle, which, on starting out in the morning, had seemed no heavier than a walking-stick, but which, on our return, weighed a ton or more. I had been out several days, and although I had been fortunate to see quite a number of moose, they had been equally lucky to see me, and I had not succeeded in getting a shot. One caribon had fallen to the rifle of a member of the party, and we had been living upon its flesh, and I would say in passing, more tender venison I never tasted. Bear were very plentiful all about us, several had been seen, and a very large one killed by one of the guides. Indeed so numerous were they that it was not deemed prudent to go any distance from camp at night. At length the day arrived when I was to bring down my first (full-grown) bull-moose. In company with my guide I left camp as soon as it was light enough to enable us to pick our way over the difficult ground.

For a long time we struggled on over the rocks and fallen timber, until at length, upon a marshy place near an extensive thicket, we came to some fresh tracks plainly visible. Evidently a bull and cow had but lately passed along, and my guide thought they might possibly be then lying down among the bushes near by. Carefully getting the wind to blow in our faces, we advanced into the swamp. I soon lost sight of my guide, and was slowly making my way as noiselessly as I could, when suddenly, close by me, a fine cow sprang to her feet and started off on a sharp trot. I could easily have shot her down, as she was not over twenty feet from me, but I restrained myself and let her go free. I have a certain satisfaction now, my brother sportsman, when I recall the fact, that I let that cow go away unshot at, for, as any one knows who has hunted moose, the temptation to shoot at one when near by is very great, and it is not easy to hold one's hand. Perhaps I may have regretted my forbearance a few moments afterward, when we came to the place and saw by the tracks that the bull had also gone off in a trot, probably having been startled by the noise made by the cow. However, it was still early in the day, and we were comparatively fresh, and after listening a few moments to the sounds made by the frightened animals as they forced their way through the bushes, we took up another line of march. We had not gone far before we came upon some more tracks, this time made by a single bull, and evidently one of large size. He had gone by but a very short time before, walking quietly along, and occasionally had nibbled away the ends of the bushes near his path. We wer con the "qui vive" at once, and giving my guide the lead I followed, stepping carefully in his footsteps. The signs kept growing fresher announcing the close proximity of our game, and I fairly held my breath, lest he might hear us and be off. At length the tracks led away in the direction of a small woods lying beyond two hills, and my guide said we should find him there. But as it was necessary we should approach him against the wind, we were obliged to skirt the base of one hill, and then pass over the other. As we drew near the foot of the first hill, a bear suddenly jumped up and went away at a great pace directly over the hill we were going to, making a tremendous noise as he tore over the trees and through the bushes. I threw my rifle to my shoulder to give him a shot, when I was prevented by the guide placing his hand on my arm, and whispering, "Don't shoot, we'll lose the bull if you do."

With great care we gradually drew near to the top of the desired hill, stooping lower and lower as we approached the crest, until at last we were fairly on our hands and knees. Some trees were lying on the top, which helped to conceal us, and on looking through their branches, with a beating heart, I saw our desired quarry standing at a distance of from one hundred to one hundred and fifty yards. He was exactly facing us, placed between two trees, which protected his sides, leaving only his chest and head in view, his horns projecting beyond the trunks of the two trees, He had evidently been startled by the noise made by the bear in his rush over the hill, and was straining all his powers to ascertain the cause of bruin's fright. But as the wind blew toward us, he had not smelt us, and we had been careful to keep out of sight. It seemed to me a long distance to shoot, and so little of the animal was visible I feared a miss. So turning to my guide, who was lying flat on the ground behind me, I asked, "Can't we get a little nearer? I fear at the best I can only wound him as he now stands." "No," he replied, "he'll see us if we move another foot, for there is not a bit of cover between us after we leave this place, so just squint your prettiest and let him have it." So admonished, I raised my rifle, and aiming as near as I could judge for his heart, I pulled the trigger. I saw the great deer flinch as the bullet struck him; but he did not change his position. "You've hit 'im" said my guide, "give 'im another bullet quick." I obeyed, sending it as near as I could to the place its predecessor had reached. At this the moose turned slowly around, exposing his flanks, when I fired another ball at his shoulder. It did not seem to affect him, but he began to move away in the most extraordinary manner, lifting his legs high in the air and then placing them as far apart as possible as though he was bracing himself from falling. "He's hard hit," soliloquised my guide; "he won't go far," and hardly had the words been uttered when with a crash the bull fell over on his side. I sprang to my feet and rushed down the hill toward him, unmindful of everything save that I had shot a moose, when the guide called out, "be careful, he may get up yet, and a wounded bull is an ugly customer, keep clear of him." Thus warned, I got behind a tree and looked at him, but he did not move, so by gradual approaches I came up to where he was lying. He was just giving his last gasp, a slow movement of the huge ears being the only sign that there was any life in him, and soon this ceased. He looked enormous as he lay there, and I climbed up on to his side, and sat enthroned. He was a very large animal, and I regret that I have not the measurements—which I took very carefully of his height at shoulder, girth, etc.—by me to record here. The horns were of fair size, not so large as many I have seen, but still of very respectable spread, and the palmation a good width. On opening him we found my ball, probably the first one, had entered the breast low down and penetrated the lower portion of the heart, and the other two had lodged close by. After skinning him we started for camp, and sent out all our force to bring in the meat. My

shots had been heard, and my friends had thought we were having an encounter with a bear, as it is not often so many opportunities are afforded to shoot at a moose. Soon the guides came into camp staggering under their loads of meat, and one bore the head and horn of the bull, which occupied us for the remainder of the day in getting ready for transportation to Halifax, where it was subsequently handsomely mounted. Merry was our evening around the camp fire, as our spirits were raised by my success, and we hoped to add some more bulls to our list of game during the time that still remained to us before we should be obliged to return to civilization; and I may add, that our expectations were not in vain, for two more of the great deer were killed, one falling to my rifle and another to that of my companions, but neither equaled in size or magnitude of antlers the one which I have here designated as my first bull-moose.

ZOOPHILUS.

For Forest and Stream.

UP ROCK RIVER.

LEAVING Janesville at 7 A. M., Sept. 15th, I pulled leisurely in my boat up the river, with only "Old Cap" for a companion. I had made up my mind to take a trip to Madison *via* Rock River, Catfish Creek, and the lakes, something different from my usual fall hunting trips. After reaching Madison I intended camping on Fourth Lake a few days, and returning the same way I went later in the fall, when "ducks were thick." "Doc" and I had talked of taking this trip for a year past, but he disappointed me; and this is how I happened to be alone, as I have said.

My boat was pretty well loaded with tent, guns, dog, and camping utensils, but pulled easily, and I made good headway with a light wind against me. Two miles up the river a small flock of blackheads flew rapidly over, but as they got well out of range before I fired, I failed to drop any, and resumed my rowing. A few miles further a solitary redhead got up within long range to the right, and by shooting well ahead I brought it down winged, but came near losing it, as it dived and hid in some brush and rushes near shore. I finally saw it and killed it; then resuming my oars, I managed to reach Catfish Creek about noon.

Catfish Creek is a small stream emptying into Rock River, about twelve miles from Janesville, and is the connecting link and outlet of First, Second, Third, and Fourth Lakes. I found the creek very swift, and swollen from recent rains. Between the mouth and the first dam, a distance of two miles by the creek, but only half that by road, are numerous wire and board fences stretched across the creek to prevent the stock from getting from one field into another. These, in the present condition of the creek, were very hard to pass through, as I had to break off a board or cut a wire with the axe in one hand, and with the other hold up the boat and keep it from floating down stream. In many places I had to get out, wade, and draw the boat after me. After a good deal of tugging I reached the dam in about two hours. At this place is a flouring mill, several houses, a church, and a few stores, which comprise the town of Fulton. At a sort of tavern I got a splendid dinner, after which I lighted my pipe and strolled down to the mill to inquire the distance to Stoughton, where I supposed the next dam to be. I found I would have to carry my boat over two dams before reaching Stoughton, besides running up two swift rapids; also that the creek was just as swift and full of fences between Fulton and Stoughton as between Fulton and the mouth; so I concluded to have my boat hauled to Edgerton, about four miles distant, where we arrived just in time to catch the express. Putting boat and everything aboard we reached Stoughton at 5 P. M., where I found an old friend who used to live in Janesville.

Next morning, having decided to lie over a day, a friend and I started for some stubble fields south of Stoughton in quest of prairie chickens. After walking about a mile we struck a large wheat field, and soon found the dogs pointing staunchly. We enjoyed a fine day's sport.

The next morning at daybreak we hitched the team to the lumber wagon, my friend Cork, who had arranged to go on to Madison with me, taking his younger brother to drive back, hauled the boat from the depot to First Lake, a distance of three miles by road, but about seven by the creek. Arriving at First Lake about 9, we hastily launched and loaded the boat. A light wind having arisen in the meantime, we "hoisted" the sail and shoved off. Passing pleasantly up stream, with alternate use of sail and oars, that forms the inlet of the lake, we at last entered the creek, which we found near the mouth to be quite wide and very deep, with a strong current. The shores are lined for some distance with rushes and wild rice, which, later in the fall, is the resort of duck and rice birds. The creek all the way between First and Second is very pretty and picturesque. Most of the way the banks are high, with thick woods, with here and there an opening and log-house in the background, reminding one of earlier days. The people living along the creek are nearly all Scandinavians, and have clumsy, flat-bottomed boats moored in front of their houses. They fish a great deal, and catch very fine fish—pike, bass, and pickerel. Occasionally one of the latter is caught weighing from 16 to 24 pounds. How one of these fellows would make a reel hum! but they do not have the gameness of the black bass, and although they fight hard for a little while, soon give up. In the spring, when the lake is high from rain and melted snow, the marshy lands adjoining are overflowed, and the fish go up the ditches, where they are found on the receding of the water, and great numbers are killed and sent to market.

Well, to return to the oars. We reached a bridge across the creek about 11 o'clock, where "Cork" went ashore to inquire the distance to Madison and get some apples. While he was gone, I got out my rod, and endeavored to catch some bass, which I could see in great numbers swimming about below the boat and under the bridge; but although I tried them with several different flies and live bait they refused to bite, and would only dart out from their hiding places, play with the bait, and run back without giving me a chance to hook them. Cork returning, we unshipped the oars and pulled for Second Lake, which we hoped to reach about dinner time. A short distance above the bridge we passed a fishing party from Madison going down the creek. The creek at this place is full of huge boulders, some nearly as large as the boat, making us keep a sharp lookout to prevent our running over them. About a mile above the bridge is a widening of the creek, covering about one hundred and sixty acres, and called, I think, Third Lake. It is quite shallow and filled with rushes and wild rice—a splendid place for ducks and geese, which were quite plenty on my return. After crossing this we pulled up the creek about a mile to a bridge, where we rested a little while before finishing the distance to Second Lake. Near the bridge, in the creek, were several large boxes sunk to the top, and which are used for coaling boxes and to keep live fish in. Having rested sufficiently, we pulled out, and soon reached Second Lake, which we entered through a narrow stream between two large mounds, and running our boat ashore climbed one of the mounds and got our first view of Madison. How beautiful it looked! The huge dome of the capitol, towering up in the distance, with the sun striking full upon it, looked like a young Sol; here and there a tall spire pointing heavenward, and in the background beautiful residences peeped out from amidst grand old trees. Altogether it was a sight long to be remembered.

But we were too hungry to gaze long, and soon had the coffee-pot over a hot fire filled with delicious Java, and then the fried potatoes and rye bread. Dinner quickly eaten and cooking utensils packed away, we started were just shoving off, when a boat rounded the point and came toward us rapidly, propelled by a muscular gentleman of the Teutonic order. When within hailing distance I called him, and found him to be a sportsman from Madison, "shooting snipe." He told us that there was a wide spread on the other side of the lake, through which we would find considerable difficulty in passing unless thoroughly acquainted, and that he would show us the way through so soon as he found his "partner," who was on shore. It was indeed lucky for us that we run across the Germans as we did, for it would have taken us till dark to find a way through. Soon passing into Third Lake we pulled until we reached Winaqua, where there is a garden and summer resort. We stopped here for refreshments, and then headed for Madison, about two miles distant. The next morning, much to our regret, Cork returned home, leaving S. and I to go camping, which we did in a few days, having a splendid time, and toward the latter part good shooting.

JUNIOR.

For Forest and Stream.

THE HUNTING FIELDS OF CENTRAL VIRGINIA.

IT has occurred to me that a few lines from Central Virginia, in reference to our forests and streams, might not be uninteresting to your readers. Probably but few of them have ever so much as heard of Buckingham County, and yet we have here a number of gentlemen as devoted to the delights of the forest and stream as perchance may be found anywhere in America.

Your valuable and charming paper fills a void and supplies a need we long have felt, and my only regret is that we live in so benighted a region as not to have known of its existence until a few months since, and I look upon the time I lost in not reading it from the date of its birth as hours of sweet rest and pleasure that are gone forever.

That man who has not in his heart a secret love of the gentle pleasures of the field and the stream, is fit for "treason, stratagem, and bloody spoils." Who does not love the memory of good old Isaac Walton? Who does not admire that calm philosophy which enabled him to live through many years of a terrible civil revolution, without, so far as we know, taking part or parcel in it, and to which he nowhere alludes in his celebrated work? The dashing gallantry of the long haired cavalier and the stern endurance of the closely shaven Puritan had no charms for him. He took a higher and nobler view of life, and while the sabres of contending factions glistened in the sunlight, he pursued the even tenor of his way, and studied the habits of the trout and the salmon, and left on record a work which will last long after the ephemeral memories of the warriors and statesmen of his day shall have been forgotten.

But I am digressing—my object was to tell you something of the fish and game of this section. And first the partridge—nobody calls them quail here. As the Virginia maidens are superior to all others, so are the Virginia partridges; well, we had plenty of them last season. Our season, by law, opens on the 15th of October, and closes on the 1st of January. I am not professional enough to know what is considered first-class shooting. I use a W. & C. Scott & Son, No. 12 breech-loader, cost $100, weight 7½ lbs., which is a good gun, but a pound too light, and I cannot quite average three out of five. I sometimes make ten consecutive shots without a miss, but this is a rule I often honor "more in the breach than in the observance;" but I have a neighbor who would be famous were his modesty not equal to his merit. This gentleman, Mr. A. J. B., of Fishpond, Weldon County, uses a gun exactly like mine, and during last season, among numberless good shots, he made one worthy of special mention, and which would do no discredit to Capt. Bogardus. Three birds rose at the same time about twenty yards in front of him, two in a direct line the one with the other, and the third flew at an angle which at a particular moment would intersect the line of the first two. At a distance of about forty yards from the nearest bird he fired at the critical moment, and got all three, the furthest bird falling at full sixty yards. To have made such a conception, and to have waited and carried it out, to bag three birds at one shot, under such circumstances, requires a keen eye, a steady nerve, and an admirable calculation of distances not often met with. Is not this good shooting? He loads almost uniformly with 3½ drachms of coarse powder and 1 1-8 oz. No. 8 shot. The recent hard winter has not perceptibly hurt the birds, and we may expect fine sport the next season. It is not unusual with us to start fifteen or twenty covies of a dozen and more birds in a day's shooting. The woodcock are by no means so plentiful, and we only occasionally start this shy bird, but some of our marshes are filled with snipe. His zigzag flying makes him a tough customer to hit, but a single shot does the work. Our woods are filled with deer and turkey and pheasants, the latter not so numerous as the former, and from the 1st of November until March the James River affords, in favored localities, good shooting for ducks and geese.

I am tempted here to describe a deer hunt we had a short time since.

While plodding away at the dry details of the law—for you must know that the law is my profession—the sturdy gravity of a law student who was reading under my advice was upset by the sight of a deer chase in front of my door. I do not suppose that he had ever fired a gun a dozen times in his life, but the sight of a noble doe bounding away with the hounds in full cry was too much for him. Instantly we had our horses saddled and away we went. I had my own riding-horse, a very good and fleet one, while there was nothing for him but an old, white-legged wagon horse, I think nearly twenty-one hands high. Goliah might have bestrode him without any fear of his feet being too near the ground. Away we went, and it was all I could do to keep ahead of Old Whitey, who seemed himself to have waked up to the sport. The deer took to the river, and the dogs were so much broken down that they would not follow. He swam about one hundred yards to an island of some forty acres, and in we plunged into a swift and treacherous ford, but our blood was up and we made it. Only three dogs followed, and after a few minutes they discovered the doe at the lower end of the island, she having lain down from fatigue, and away they came toward us at full speed. She had to run a quarter of a mile to a certain point at which they almost always crossed the river, and we had to ride about as far to meet her. The dogs opened in full cry and we spurred for life. Every nerve was strained to the highest pitch of excitement, but "Old Whitey" was equal to the occasion. I could not fire from my horse, but sprang from him in time to take a shot at sixty or seventy yards, which wounded the doe but did not perceptibly slacken her speed. I thought all was over, and looked behind me to see "Old Whitey" standing stock still, and his rider perched high on his back levelling a long, single-barreled gun of antique manufacture. In an instant he was surrounded with smoke and a deafening report rent the air. I looked, and the doe turned two or three double somersaults, and uttering a shrill cry she breathed her last. He had shot her directly through the heart. Could an artist have caught upon canvass the look of sweet and serene satisfaction which lit up the features of her slayer while he contemplated the large and noble animal now stretched before him on the sand, it would have immortalized him forever. But I am trespassing too much upon your space and will wait for another time to tell you something of the fish in our waters, and will only stop long enough to say, that the silver perch, the yellow perch, the Southern club, the white club, the pike, the trout, and a nondescript ycleped the "Goggle Eye," form all of our game fish except the blue catfish (the black bass is a recent importation), if he may be raised to the dignity of so respectable a category, about said species of which I trust to tell you something hereafter.

BUCKINGHAM.

For Forest and Stream.

A COON FIGHT IN KENTUCKY.

WHEN the weather softens and the snow begins melting after a cold spell, every pedestrian about the cross-roads in Mercer County keeps an eye out for coon tracks, and he who chances upon the trail of a broad-footed member of the ring-tailed family is a traitor if he fail to follow it till no doubt exists as to the exact tree in which his coonship is ensconced, and then hastens to the store to report success to us idlers who scrape the mud off our stogies on the box of gravel, sand, shavings, chestnut and hickory nut hulls—the common spittoon—in which the stove sets, smoke and chew "long green tobacco," and swop yarns till feeding time, unless the promise of fun is good. One of the faithful made his report before noon on this eventful day. As he came to the store to procure a set of knitting needles for the "old woman"—a majority of us drop in on bad days, avowedly in quest of some small article badly needed at home by the Madame—he crossed the trail of one he knew to be a whopper, and patriotically followed its windings just three miles, as computed by those who knew every inch of the ground traversed and the exact distance between the various landmarks enumerated; and all that tramp over the back track to find the tree less than half a mile from his starting point.

Higgins is the autocrat of the cross-roads—for he owns the store. If there is any one variety of the numerous sports which Hig. loves best, it is a coon fight, and he is the undisputed master of ceremonies at all our battles, for he is in the sportsman's seventh heaven when commanding forces in a coon engagement. Notice was promptly served upon a dozen owners of young, inexperienced dogs, and four parties, who are known to always have sharp axes, were ordered to report promptly at the designated hour, for that coon couldn't find comfortable hiding in any ordinary tree. Rumor of the fun spread rapidly, and at 2 o'clock P. M., sharp, the appointed hour, about forty individuals, all sizes, ages, and colors represented, had assembled at the store, and the man whose mania is dogology couldn't do justice to that pack of fourteen barking, snarling, snapping warriors, "enlisted for the war." Obedient to Higgins's command, the crowd started in high glee, amid a perfect babel of dog-calling. A trudge of a mile through snow three inches deep brought us to the tree, an old oak, which had not evinced the lofty aspiration of many of its fellows, but had signally eclipsed that forest in attainment of circumference.

It is never expected that General Higgins will swing an axe on such occasions if he have more than one companion—he is subject to rheumatism—and on this occasion he selected his choppers and relief, and ordered an immediate assault, with assurance that he was responsible for all damages claimed by owners of the woods. That was good as the boys wanted, and they fell to lustily—four muscular axemen throwing chips in a shower. Many were the witticisms uttered, and loud and frequent the laughter, as the chopping progressed. Numberless were the surmises as to the size of that coon, but the conviction was universal that rich sport would soon be ours, as *not* a member of our dog militia, in which collection the hound, terrier, bench-leg, cur, pointer, dropper, and mongrel were represented, had ever seen a coon.

About the time the relief had got warmed up, and the lookers-on had begun selecting standing ground which would be safe at the time the tree fell, an individual, attracted by the noise our crowd made, appeared upon the scene, followed by a bench-leg and an old *yaller cur*, about the size of a Shetland pony, which he called Tiger. He was immediately interviewed as to Tige's coon-fighting accomplishments, and unhesitatingly declared Tige to be the best coon dog in Kentucky, as he had never been known to make the second pass at the biggest coon he ever seed. Tige had chawed up every dog that ever tackled him, had whipped a catamount a "fair fight," and "durned if I don't believe he can whip a two-year-old black bear," was his by no means consoling climax of Tige's accomplishments and abilities.

The owner was well known to every individual present, and it was equally well known that if he had ever told the truth in any trivial matter, such as his pangyeric on Tige, it was *unconsciously* done, but Tige was a stranger to all, and as his size and general appearance lent plausibility to a portion of his master's declarations, our commander deemed it prudent to appoint a committee to attend to Tige by turns, till we had our fun with the dogs we knew. Snob, whose end of the double tree is always kept fully up if not a little in advance in all matters of sport, was appointed chairman, and he nailed his charge when the tree began falling. Crash came the tree, and out stepped a couple of large coons, one a monster, indeed. The smaller coon took a sapling near by, and our pack went for the big one. The crowd formed a ring around the combatants, and the work was lively for a few minutes. Yelp after yelp proclaimed a dog hurt, and soon one of the pack concluded that there was more fun for him in quietly dressing his wounds, as was inferred from his prompt withdrawal from the circle, and obstinate refusal to be coaxed back. One by one they followed suit, till but four were left that could be encouraged to persist, and they soon adopted snapping tactics when his coonship was surrounded. The entire pack of fourteen was so badly used up that not a dog could be induced to put himself within reach of the enemy, and as 'twas growing late, no one objected to the proposition that the coon be allowed a short "blowing spell" in the pool

of water which he had gained, and Tige be turned loose to finish him. To the credit of that coon, we state that a hind-leg was broken by the fall of the tree.

Tige struggled furiously against the restraint of the committee, and when turned loose rushed for that coon with the fury of an enraged *Tiger* indeed. His master's exultant pride beamed from every feature, and his attitudes were as supposing as those of a general of a cornstalk militia on muster day. The silence of the crowd was painful in expectation of that gallant coon's instantaneous demolishment by furious Tiger, but the wild whoop of a band of Indian warriors is but the murmuring of a rivulet, compared with the boisterous, thundrous uproar of laughter, which shook the very trees, when Tige came yelping lustily with that crippled coon proudly perched upon his left ham, teeth and claws too firmly imbedded for him to be rolled or shaken off. Tige darted hither and thither within that unfeeling, roaring circle, evidently in quest of his master, from whom alone he could hope for succor. Failing to find him, Tiger sat down, the coon "affectionately sticking to him," wept aloud, and most piteously hollowed "'nough," if any quadruped ever did. The moment the coon was removed Tiger cleared the circle and struck a bee-line for home at a speed which would put to blush the swift-winged swallow. Mat was nowhere in sight, but doubtless heard the three loud cheers which were given for Tiger's culmination of that afternoon's sport. Fact, every word of it. KENTUCKIAN.

Fish Culture.

TREATMENT OF TROUT DURING THE FIRST YEAR.

THE preparation of the pond for the reception of the young fish should be completed the previous autumn, before needed for use in the following spring. In our trout streams the first spawn is taken about the first of November, and the ova begin to hatch about the middle of December, and the complete metamorphosis of the fish takes place the middle of February, while are in a condition for transferring from the nursery troughs to the pond about the middle of April. If the pond is now occupied by yearlings, they must be removed, to give a home for the young crop. Before transferring the yearlings from the pond the water must be drawn down, and if the water plants are large enough to interfere with the working of the net, they should be cut with a sharp scythe and raked out, as it is quite impossible to remove the young fish with a net until the pond is freed from the rank vegetable growth. The net, of course, in its construction must conform in texture and in mesh to the size of the fish; and as many are yet small, therefore, mosquito netting is the most appropriate material for its construction. The net may be made about two and a half feet wide and about four feet longer than the width of the pond. A nicely adjusted lead-line should be attached to the bottom and a few wooden floats fastened to the top; at each end there should be a brail, as in the case of a common seine, and we have a perfect minature net for the removal of the fish. Manned by two men, the seine is dropped into the lower end of the pond, and holding the brails steadily and uprightly, is moved upward evenly across the pond to the inlet, where it is carefully changed into a horizontal position, and being raised out of the water it is carefully carried to the second pond, and its contents gently deposited therein. The net is repeatedly used until the fry are all removed. Since the autumn mowing of pond No. Two, the water-plants at the bottom, now in April, seem green, and every leaf and twig is covered with minnate aquatic insects and water-bearing larrae. These are all the natural food of the young trout, and the more abundant these parasites are, the more rapid and striking will be the growth of the fish. Pond No. One being empty and ready for its new occupants, we set about the removal of the new brood from the hatching-house to their new quarters. A small scoop-net, for removing small fishes from the nursery-troughs, is the most convenient implement for this purpose. It may be constructed of the same material as was the minature seine. The bottom should be equal in width to the width of the nursery-troughs and the height equal to twice their depth. For fastening the netting, a border of wire may be shaped, as outlined, and fastened into a wooden handle, and the net is completed. The bottom of the scoop-net is pushed forward, and the entire contents of a compartment may be taken at one scoop, and being emptied into a flat vessel of water, are transferred to the pond, where they at once show their appreciation of their greatly enlarged quarters, by darting here and there, and cavorting in various ways in their new boarding place. In this manner the fry of one trough after another is removed until all are placed in the pond. Here in their new home the future growth of these domesticated trout depends upon the quality and quantity of food given them during the first year. It must be remembered, that in subjecting so many fish to live in such a small area of water, artificial food in suitable quantities becomes necessary, indeed, indispensable. For a time one generous meal each day, with what insects are captured by them, will be sufficient. If the fish-farmer neglects to bestow upon his wards a necessary amount of food, the weaker and smaller members of the colony will rapidly diminish, thereby greatly increasing the expense of board in the aggregate. Trout are cannibals, and all the arts of modern civilization applied to their domestication have thus far proved entirely abortive in correcting the habits of their wild and gross natures. They delight in devouring one another, and hence should be so assorted in their growth, as to prevent preying upon themselves. If by accident any large fish gain admission to ponds containing small ones, they must be removed at once, even if their destruction becomes necessary to accomplish their removal. The appropriate food for the young trout during the first year is the same in quality as hitherto used, only to be increased in quantity to meet their increased wants. When the trout are six months old the food need not be reduced to such fine particles as was necessary in their earlier infantile life; consequently, the labor of the fish farmer is greatly lessened. The water supply at all stages of fish culture needs to be carefully adjusted. To this matter the farmer's care should be constantly directed, especially in hot weather, for the weaklings of the colony may die from an insufficient amount of oxygen—the vitalizing agent of all animal life. The water plants perform excellent service in oxygenating the water, especially in ponds where a strong current is impossible, from a want of elevation in the water-courses which supply the fish farm. The water plants should be encouraged, especially the hornwort (*ceratophyllum*) and the water starwort (*callitriche*). On the other hand, the current may be so strong as to drive the small fishes into a puddle against the lower screen, amidst the debris which there collects, where many must inevitably perish. As the young and feeble fish are yet unable to stem the strong current, a careful watch will be necessary for a number of days, meantime regulating the current from time to time to suit the condition of the fishes. As the meshes of the screens must necessarily be small to prevent the escape of the fish, they will easily become clogged with dirt, therefore, they should be frequently inspected and cleaned, by rubbing the dirt through them with a common scrubbing brush, attached to a handle of convenient length, otherwise, the ponds will overflow and a loss of stock will be the inevitable result. To prevent the accumulation of straws, leaves, and other debris, which may be blown into the ponds, the leaf screens should be frequently cleaned out, or these, too, may lead to disastrous overflows, especially in connection with freshets. The screens should be examined at least daily, to prevent any catastrophe that might ensue from damming, especially during the prevalence of high winds. Extra screens should always be kept for an emergency, especially to supply the place of a broken one. These may be made and kept in the workshop, ready for use at any moment. Any other tools liable to be broken, which are constantly employed, should, by the same foresight, be kept on hand, that they may be put into immediate use. The fish farm should be supplied, in all cases, with a convenient and roomy shop, even with a blacksmith's plain outfit, for any man may soon learn to weld and shape a piece of iron into a useful instrument with less expense than to be obliged to go to a blacksmith for every trifling article, many of which may be fashioned very easily. It will be found in feeding the young fry, if their appetites seem to be increasing in voracity, that two meals each day will become necessary, and when resorted to, an early meal may be given, and the last one while the sunlight is sufficiently strong to enable them to seize every particle before it sinks. Care should be exercised lest over feeding may occur, for it is considered good economy in the practice and management of the fish farmer not to keep the trout too fat, but only in a state of thrift in keeping with health.

No tainted meats should be fed, for fish will not eat such food unless compelled by hunger, while what is left soon contaminates the water, and if persisted in, would very soon render the fish sickly, and perhaps permanently diseased. Trout should be given a wide range of animal food, for it is perhaps as true of fish as of every voracious animal, that a change is desirable. The most of our American species of fishes are carnivorous. If we had the kind of fishes the traveler Huck speaks of, as existing in the southern provinces of China, pisiculture would be as simple to practice as the plainest principles of agriculture are in farming. He says of these singular fishes, "a month after they are hatched they are full of vigor, and this is the time to give them food in abundance. Morning and evening the proprietors of the *vivaria* have their fields mowed, and enormous loads of grass or herbs are taken to the fishes. The fishes ascend to the surface of the water, and dart with wild eagerness on this food, which they playfully devour, with a rumbling noise, reminding one of the noise made by a large number of rabbits feeding—indeed, it might be supposed that they were a large warren of aquatic rabbits. The voracity of these fishes can only be compared to that of silk worms when about to prepare their cocoons. After having been fed in this manner for about fifteen days, they ordinarily attain a weight of two or three pounds, when their growth is arrested and they are caught and sold."

If this observation is true, the Chinese have a valuable species of fish, an unfailing food resource, that can only fail when the forage crop fails, upon which they are fattened; but rather unprofitable, if the products of the water and land are both required for subsistence. This passage of the pious writer, who was sent by his country to disseminate religion among these heathen, reads much like incidents related by another celebrated writer, Munchausen. The amount of food required by domesticated trout must vary with different fish farms, for in some localities the water is richer in insects and crustaceous than in others. Apropos of this proposition, where a trout stream flows through a rich, fertile district of country, with abundant drains reaching far inland, the trout are usually well conditioned, and large, and of excellent flavor; but when the land through which the stream flows is sterile and rocky, without drains to bring down the rich, coveted food of the trout, the fish will be found to be lanky and without flavor; they may be numerous, as are all the outgrowths of poverty, but small in size and very indifferent. There are differences to be found in the same stream. Some of the trout are sharp in their colorings, have fine plump shoulders, great depth, and the flesh is beautifully tinged with the salmon color, and of excellent flavor; while others, of the same blood and kindred, are lean and without flavor. It may be accounted for in part in this wise. Those trout which are so plump, fat, and pleasing to the eye, are industrious feeders, and become well conditioned, while the slothful feeders are lean and flavorless. The rule is, those trout which are bred upon the best feeding grounds, living upon the worms and crustaceans of fresh water, are most desirable. The fish farmer can only regulate the amount of food necessary for daily use, by the same experience which is exercised by the agriculturist in stock raising. It varies one day with another, as with all animals. As atmospheric changes affect the appetites of mammals and other animals, undoubtedly similar causes influence the desire for food in fishes. Domesticated trout, like those in the wild state, feed best just after sunrise as a rule. Notwithstanding that this may be accepted as a settled point, both the wild and the trout of fish farm often appear to have a positive disgust for food. The righteous soul of many a patient, and *even pious, angler* has been terribly exercised, in view of this loathing of the most alluring enticements that art has designed, and the indignant disciple of the rod has often been obliged to quit the field in disgust, and the reason why every species of the *salmonoides* take these freaks has never yet been explained, when at the same time every attending circumstance in nature seems to favor success. Fifty thousand trout six months old, well supplied with larvae, usually consume about a pound of the chopped hearts of beeves three times a week. Probably, the larvae of flies are the most economical food the fish farmer can use. They may be very cheaply obtained. A cheap box, five feet long and two feet square, set on end, the upper end down two feet, should be thickly pierced with holes. Eighteen inches down, a drawer six inches deep, as wide as the inside of the box, should be carefully fitted, and just over it slats arranged upon which the offal is placed. On the top should be a close-fitting lid, and the "*Larvae Generator* is completed. In order not to be offensive, this box should be kept in an unfrequented point of the farm concealed from view. When the larvae are wanted they may be poured into a small box, from which they may be scattered over the pond. Not a single grub will escape from the eager, sharp-eyed trout. These may be used according to the quantity that may be daily produced, and as the judgment of the fish culturist may dictate. It is said that trout fed upon this grow more rapidly than those fed upon any other kind of food, and amply repay the labor required for their production. NAHUM E. BALLOU, M. D.

SANDWICH, ILL., March 3d.

FISH CULTURE AT THE AQUARIUM.

The following paper was read by Fred. Mather, Esq., Superintendent of Fish Culture at the Aquarium, before the recent meeting of the Fish Culturists' Association:

"The Department of Fish Culture of the New York Aquarium has the honor to report as follows:

"Sixty thousand eggs of the California salmon were received in the month of October to be hatched for the United States Fish Commission. They were packed in moss on the McCloud River, Cal., by Mr. Stone, in the usual manner, and arrived by express in good order, with a loss of not over three per cent. Of these eggs 8,200 died, or were killed, before hatching; and I will here say that we have had a difficulty to contend with that is not met with in an ordinary hatching-house, viz., handling eggs by visitors. In the State and other establishments there are no more people than the attendants can watch; but in the crowds at the Aquarium it has been a common thing to find that while talking to one party, another by your side has a handful of eggs going off to the window to examine them, and which were invariably killed. To remedy this I made the water deeper, which lessened the current, and was consequently injurious to some eggs, and fatal to those of the whitefish. The salmon eggs were received Oct. 11th, and all hatched by Nov. 4th, the water ranging from 60 degrees at first, and steadily dropping to 54 degrees. It is worthy of note, that while the time of hatching from the first one out of the egg to the last was only eighteen days, the difference in the time of the absorption of the umbilicus was nearly forty days; that is, the first fish took food Dec. 19th, and all were feeding by Feb. 1st., excepting, perhaps, a dozen individuals, whose sac was only half gone. By the 1st of Jan. the temperature had lowered to 40 degrees, and has since stood at 38 degrees. Some of these salmon have been distributed to New Jersey waters, others to Long Island, and the remainder are destined for a lake in Northern New York.

"I would call attention to an experiment made in feeding in the Aquarium. A month ago 500 of these salmon were put in one of the small tanks in a temperature of 60 degrees, or 22 degrees warmer than those in the hatching troughs where the Croton runs, and a great difference in size can now be seen, those in tank No. 18, being much larger than the others of the same age in the colder water of the troughs. This bears on the question of their adaptability to southern waters. We have also received 25,000 eggs of the whitefish from Mr. George Clark, Commissioner on Fisheries for Michigan; these, with 10,000 from Seth Green, were lost for want of circulation, as noted above; 5,000 more have just been received by favor of Mr. A. J. Kellogg, also of the Michigan Commission, which will be put in a jar and hatched in bulk; 15,000 eggs of the Cisco, or lake herring, have been received from O. M. Chase, Supt. of the Detroit Hatchery, which are doing well; 10,000 eggs of the Lake trout, from the New York House at Caledonia, are still in process of hatching; 2,000 eggs of the land-locked salmon have been received from Prof. Baird, and are placed in one of Ferguson's hatching jars, which has been presented by the inventor.

"In the salt water department, in tank No. 12, can be seen the curious eggs of the skate, or ray, with their yolks visible when a light is placed behind them; they are supported by a string in a good flow of water, and in nearly the same manner as they are hung upon seaweed. Whether these eggs are impregnated or not, I am unable to say, as they were laid in the great tank by the fish, and their development is not far enough advanced to determine with certainty. A great many valuable experiments can be conducted in an aquarium, both in salt and fresh water, that would be difficult at almost any other place, and we wish the hearty co-operation of fish culturists all over the country, and will be glad to work with them, and perhaps try the same experiments under different conditions of temperature, light, etc., that they may be conducting, and so arrive at results in the shortest space of time. Mr. Coup is disposed to place the whole Aquarium at the convenience of practical or scientific men to aid them in any studies or experiments that they may wish to pursue.

"The Department of Fish Culture is under obligations for favors to the following gentlemen: Prof. S. F. Baird, U. S. Com. on Fisheries; Hon. Robert B. Roosevelt, Com. for New York; Geo. Clark, Ecorse, Mich.; Seth Green, Rochester, N. Y.; Monroe A. Green, Mumford, N. Y.; A. J. Kellogg, Detroit, Mich.; O. M. Chase, Detroit, Mich.; Samuel Wilmot, Ontario; Livingston Stone, Charlestown, N. H.; T. B. Ferguson, Baltimore, Md.

"Since writing the above Mr. Wilmot has presented 1,000 eggs of the Ontario salmon (*S. Wilmoti*), which appear in first-rate order."

MICHIGAN FISH NOTES.—The second season of the Detroit branch of the Michigan State Fish Hatchery is drawing to a close. It has been remarkably successful—more so than was the season of 1875-6. Last season between 8,000,000 and 9,000,000 whitefish, salmon, and trout were hatched and distributed through the lakes and rivers of the State. This season about 8,000,000 whitefish, and no other kind, have been hatched, and are healthy, and in a likely condition. The percentage of loss in eggs this season has been much less than that of the season of 1875-6, showing that with experience a gratifying improvement follows. Already the work of distribution has begun, and is going forward excellently. To the month of Grand River, and the waters of Spring Lake, and Muskegon Lake, 150,000 fish have been taken. Last week 50,000 were deposited in the Huron River, and an equal number in the River Raisin; 80,000 fish have just been shipped for distribution in the vicinity of Hillsdale, and another consignment of 200,000 started for Port Huron and vicinity. ROVER.

Detroit, March 16th.

—The Fishery Commission of the State of New York will distribute 1,500,000 young brook trout to depleted streams in this State during the present year.

Natural History.

For Forest and Stream.

SOME FLORIDA FISHES.

On the East Coast of Florida is to be found the largest of the *Percoids*, and one of the largest of edible fishes—the Jewfish, Guasa of Cuba, *Promicrops Guasa*, Gill. Individuals have been taken in the Halifax and Indian Rivers of 400 pounds to 500 pounds weight. One was shot last year by B. Pacetti, of Musquito Inlet, in Spruce Creek, which he estimated at 600 pounds, and he is probably as well acquainted with the fishes of this coast, as well as those of Cuba, as any other man. I have only seen one of them taken with hook, and that was a small specimen, weighing only 19 pounds. It very much resembled an overgrown tautog, or blackfish, both in form and color. I afterward partook of it upon the table, and found it excellent eating.

Last winter we set a large shark hook, attached to a heavy line, baited for sharks, near the Inlet, and next morning found the hook broken. It had a strong chain and swivel to it, and Pacetti was of opinion that a large jewfish was the marauder, the jaw of a shark not being powerful enough to produce this effect, while those of the jewfish are. It is a sluggish fish, usually living among rocks or under a bank, to which stronghold it retreats when hooked or speared, and from which it is difficult to dislodge it.

The rock-grouper, *Epinephelus Nigritus*, Gill? resembles the jewfish in appearance and habits, but is very much smaller, rarely exceeding ten pounds in weight; in some places, however, it is called by the latter name. I caught in the Halifax River, February 8th, while fishing for sheepshead, a fish of about two pounds weight, which so much resembled the tautog that I took it for a stray specimen of that species. But our guide and referee in all piscatory questions, B. Pacetti, pronounced it to be a Cuban fish called "Cropa," and says it is common here in summer, that it is taken with the cast net while sleeping on the surface, and that he never before saw one taken with the hook. I think it is mentioned in Gill's Catalogue of the Fishes of the East Coast of North America, under the name of *Epinelepturus Boscii Lac*, Chopa bauca of Cuba; Bream of Bermuda. We found it rich and delicate when cooked, much like the pigfish.

I have also taken, in the warm weather of April in these waters, a handsome fish of one or two pounds weight, for which even Pacetti has no name, save that he calls it a Cuban fish. It is shaped like the fresh-water sunfish, *Pomotis*, nearly circular in form, light colored beneath, dark above, with brassy and bronze-colored tints on the side, with metallic reflections, and a black spot near the gills; very active and vigorous, as its form denotes, and of excellent flavor, as indeed almost all the fishes of this coast are.

A year or two ago I mentioned in FOREST AND STREAM the capture of a Neuse shark, which I called *Somniosus*, in this river with my rod, and was severely criticised by Professor Gill for my statement, he asserting that *Somniosus* was a purely northern species. I have lately found in "Gosse's Naturalist in Jamaica," a description of a Neuse shark, *Scyllium cirratum*, Cuv., found in those seas, which exactly corresponds with my fish, of which I have since taken another specimen. "Upper parts of a dull brown hue; inferior parts white; eye white and very small; scales minute, round, and strong; teeth small, with a single high central point, and three small points on each side; two fleshy civri, about two inches, long depending from the muzzle; length of specimen 7½ feet; habits sluggish; taken only for its liver, from which oil is made."

A specimen of this Neuse shark may be seen in the collection of the Chicago Academy of Sciences, which was taken by Dr. Vielo on the West Coast of Florida. This may convince Prof. Gill of the existence of a Neuse shark in Florida waters; so that he may venture to add *Scyllium cirratum* to his list of the fishes of the East Coast, or, if not, it will be easy to obtain a specimen here. S. C. C.

CURIOUS HABIT OF A CATFISH.

We have received the following extremely interesting note through Prof. Spencer F. Baird, of the Smithsonian Institution, whose interesting explanatory letter we append:—

VANDERBILT UNIVERSITY,
Nashville, Tenn., February 19, 1877.

PROF. SPENCER F. BAIRD, *Commissioner of Fish and Fisheries, Smithsonian Institution.*

DEAR SIR:—About the middle of July, 1868, while on a visit to Mobile, Ala., I accompanied a party of friends on a fishing excursion to Fish River, a small stream on the eastern side of Mobile Bay, some twenty-five miles below the city.

This river, near its mouth, widens out, forming Berwick's Bay, a sheet of water about three miles wide by four in length. This Berwick's Bay is a favorite fishing ground, being the resort, especially after a storm in the Gulf, of immense schools of mullet. A great variety of other fish, such as the croaker trout, redfish, etc., abound in this bay.

Capt. Wemyss, who owned a large saw-mill on the bank of the river, and whose hospitality we were enjoying, kindly proposed to show us the different kinds of fish which frequent these waters, and to this end furnished a large seine and the necessary force to draw it.

While examining the fish, my attention was called to several cat, each about ten inches in length, which seemed to have a wonderful development of the throat. On examination, the enlargement was found to be caused by small catfish and eggs, which were carried in the mouth. From the mouth of one I took out eleven small fish, each about an inch in length; and from another eight or nine eggs, the size of a small marble, the eyes of the embryonic cat showing distinctly through the thin membrane enveloping the egg.

On inquiry made of several old fishermen in the neighborhood, and of a large number elsewhere, I have failed to find one who knew anything whatever of this habit of the catfish. If the observation is new and it deserves to be placed on record, you are at liberty to use this in any way you may deem proper. Very respectfully,

N. T. LUPTON.

WASHINGTON, February 20, 1877.

EDITOR FOREST AND STREAM:—

I inclose, herewith, a letter from Prof. Lupton, of Nashville, in reference to the habits of our catfish, which is in corroboration of what is already known in regard to species of the same genus from Central America. Prof. Gill informs me that the fish is probably a species of *Ariopsis*, in all probability the *A. Milbarti*, or sea cat of the Atlantic coast.

This fish is not unfrequently taken in pounds on our Eastern Coast, and I would invite attention to it during the coming summer. I have taken it myself at Beasley's Point and Vineyard Sound, and presume it is common in the summer season in the vicinity of New York.

Yours truly, SPENCER F. BAIRD.

A LIST OF BIRDS OBSERVED ON AND AROUND CLARK'S ISLAND, PLYMOUTH, MASS.

BY F. C. BROWNE.

EDITOR FOREST AND STREAM:—

The following list is from observations a long time ago, namely, in 1852, between May 1st and Dec. 25th, but I think it would correspond in the main with one made up at the present time. A few species observed during visits since that date (one of them of considerable interest) I have noted below. A word as to the locality. This island has an area of about eighty acres, elevated, fertile land, is situated two miles or more from the main land proper, along which are ranged the towns of Marshfield, Duxbury, and Plymouth; but it is sheltered on the seaward side by a narrow beach of several miles in length, which, at its nearest point near its extremity, approaches within a quarter of a mile or so of the island. In old times it was a very famous gunning location, and many are the thousands of ducks and plover that have had their "hang up" in the breezy porch of the old house. But now the marshes and beaches are comparatively deserted, and although the ducks still visit their old haunts in considerable numbers, it takes a good gun "held straight" to stop enough to make a "good bunch o' fowl" nowadays. The nomenclature is worthy that of Coues. F. C. BROWNE.

Framingham, Mass., Feb., 1877.

1—ON THE ISLAND.

Robin	*Turdus migratorius.*
Brown Thrush	*Harporhynchus rufus.*
Catbird	*Mimus carolinensis.*
Chewink	*Pipilo erythrophthalmus.*
Baltimore Oriole	*Icterus baltimore.*
Kingbird	*Tyrannus carolinensis.*
Red-wing Blackbird	*Agdarus phœniceus.*
Crow Blackbird	*Quiscalus purpureus.*
Bobolink	*Dolichonyx oryzivorus.*
Meadow Lark	*Sturnella magna.*
Song Sparrow	*Melospiza melodia.*
Golden-wing Woodpecker	*Colapies auratus.*
Barn Swallow	*Hirundo horreorum.*
White-bellied Swallow	*Tachycineta bicolor.*
Black-billed Cuckoo	*Coccyzus erythrophthalmus.*
Hummingbird	*Trochilus colubris.*
Wild Pigeon	*Ectopistes migratorius.*
Pine Linnet	*Chrysomitris pinus.*
Goldfinch	*Chrysomitris tristis.*
Red-poll Linnet	*Aegiothus linaria.*
Pine Grosbeak	*Pyrricola enucleator.*
Snowbird	*Junco hyemalis.*
Sharp-shinned Hawk	*Accipiter fuscus.*
Eagle	*Haliætus leucocephalus.*
Barred Owl	*Syrium nebulosum.*
Snowy Owl	*Nyctea nivea.*
Little Night Owl	*Nyctiæ acadica.*

NOTE.—At various times since date, as above, have recorded the following additional:—Black Rail, *Porzana jamaicencis*, (a single specimen obtained August, 1869). Woodcock *Philohela minor*, (on the marsh just across the channel from the island). Shore Lark, *Eremophila alpestris*. Great Horned Owl, *Bubo virginianus*. Quail, *Ortyx virginianus* (breeding on the island in 1876; first time for many years).

2—ON THE BAY AND BEACHES IN VICINITY OF THE ISLAND.

Sanderling	*Calidus arenaria.*
Turnstone	*Strepsilas interpres.*
Yellow-leg	*Totanus flavipes.*
Greater Yellow-leg	*T. melanoleucus.*
Solitary Sandpiper	*T. solitarius.*
Spotted Sandpiper	*Tringoides maculatus.*
Semipalmated Sandpiper	*Ereunetes pusillus.*
Wilson's Sandpiper	*Tringa wilsonii.*
Pectoral Sandpiper	*T. maculata.*
Red-back Sandpiper	*T. alpina.*
Red-breast Sandpiper	*T. canutus.*
Bonaparte's Sandpiper	*T. Bonaparti.*
Stilt Sandpiper	*Micropalama himantopus (single spec.).*
Black-breast Plover	*Squatarola helvetica.*
Golden Plover	*Charadrius fulvus.*
Ring Plover	*Aegialitis semipalmatus.*
Piping Plover	*Aegialitis melodus.*
Upland Plover	*Actiturus bartramius.*
Red-breast Snipe	*Macrohamphus griseus.*
Esquimaux Curlew	*Numenius borealis.*
Hudsonian Curlew	*N. hudsonicus.*
Long-billed Curlew	*N. longirostris.*
Blue-wing Teal	*Queynedula discors.*
Dusky Duck	*Anas obscura.*
Pintail Duck	*Dafila acuta.*
Shoveller Duck	*Spatula clypeata.*
Velvet Duck	*Oedernia fusca.*
Surf Duck	*O. perspicillata.*
Scoter Duck	*O. americana.*
Scaup Duck	*Fuligula marila.*
Eider Duck	*Somateria mollussima.*
Buffle-head Duck	*Bucephala albeola.*
Long-tailed Duck	*Harelda glacialis.*
Red-breast Merganser	*Mergus serrator.*
Canada Goose	*Bronta canadensis.*
Brant Goose	*B. bernicla.*
Bonaparte's Gull	*Larus philadelphia.*
Kittwake Gull	*L. tridactylus.*
Black-back Gull	*L. marinus.*
Herring Gull	*L. argentatus.*
(Pomarine?) Jaeger	*Stercorarius (pomatorlinus?)*
Least Tern	*Sterna frenata.*
Common Tern	*S. Wilsoni.*
Black Tern	*Hydrochelidon plumbea.*
Great Loon	*Colymbus porgualtus.*
Black-throat Loon	*C. arcticus.*
Red-throat Loon	*C. septentrionalis.*
Gannet	*Sula bassana.*
Cormorant	*Graculus carbo.*
Little Auk	*Mergulus alle.*
Horned Grebe	*Podiceps cornutus.*
Great Blue Heron	*Ardea herodias.*

HABITS OF DOMESTICATED WILD GEESE.—A correspondent in Christiana, Pa., writes:

"Mrs. Groff, of Lancaster County, received from a friend in Indiana a pair of wild geese, male and female. She has been very successful in raising them. The young geese do not lay till they are three years old, and but three or four eggs at first, adding one every year after. Although she has the common variety, they never have shown a disposition to cross. I saw them last spring. Several of the geese were sitting at the time. Their nests were built on the brest of a mill-dam close to the house, and constructed of brush and weeds, and were nicely covered with down and feathers. I saw them again last fall, and then she had a flock of thirteen as nice Canada geese as I ever saw. The first ones had the tip of wing taken off at first joint; but she said they did not show much disposition to migrate. They are very hardy, and raise nearly all their young, and are quite as tame as our common variety. I think they would be just the thing for to call down them wild species. G. P.

A PROOF OF INSTINCT.—The large flocks of geese, which are constantly passing over the town, are frequently shot at, but they generally fly too high to be reached by the leaden missiles. Sometimes, however, the shots take effect. The other day we were watching a flock flying southward, when the report of a gun was heard, and we observed one of the geese begin to fall slowly. The others, perceiving that their comrade was wounded, uttered shrill cries of distress, and about a dozen of them flew under the wounded bird, huddled together so that their backs formed a sort of bed upon which the wounded one rested. They buoyed it up for some time, the others meanwhile looking on and manifesting their concern by uttering loud, discordant shrieks. Finding that their companion was unable to longer accompany them in their flight, they abandoned him to his fate, and he fell to the earth and into the arms of an expectant Chinaman.—*Anaheim Gazette.*

THE BIRDS OF WEBSTER, NEW HAMPSHIRE, AND ADJOINING TOWNS.

BY CHARLES F. GOODHUE.

Continued from our issue of March 1st.

ICTERIDÆ—ORIOLES, STARLINGS, ETC.

Dolichonyx oryzivorus. Bob-o-link. Abundant summer resident; breeds.

Molothrus pecoris. Cow bunting. Not common; have found a few eggs in the last four years.

Agelæus Phœniceus. Red-winged blackbird. Abundant summer resident; breeds, nesting in low bushes and bunches of grass in meadows and around ponds.

Sturnella magna. Meadow lark. Common in summer; has been known to remain through the winter, but not often; breeds in low fields.

Icterus Baltimore. Baltimore oriole. Common summer resident; breeds, often two or three pair on one tree.

Scolecophagus ferruginens. Rusty grakle. Common in the migrations.

Quiscalus versicolor. Crow blackbird, purple grakle. Not common; few pair breed on a small island in the river, at a place known as the Bays.

CORVIDÆ—THE CROWS AND JAYS.

Corvus Americanus. Crow. Common in summer; less so in winter; breeds.

Cyanula cristata. Blue jay. Common resident; most so in winter; breeds. This bird is a great nuisance, destroying large numbers of the eggs and young of the smaller birds.

TYRANNIDÆ—TYRANT FLY-CATCHERS.

Tyrannus Carolinensis. King bird. Common summer resident; breeds. I once saw a pair of these birds robbing a pair of least fly-catchers of their nest, to build their own with.

Myiarchus crinitus. Great-crested fly-catcher. Not common; a few breed, nesting in hollow trees. The nest almost always has one or more snake skins woven in among the other materials.

Sayornis fuscus. Pewee. Common summer resident; breeds.

Contopus borealis. Olive-sided fly-catcher. Not common in summer; breeds.

Contopus virens. Wood pewee. Common in summer; breeds. The nests and eggs of this species are the most beautiful of any of our birds.

Empidonax Traillii. Traills fly-catcher. Not a very common summer resident; breeds, though not often.

Empidonax minimus. Least fly-catcher. One of the most common of the fly-catchers; breeds.

Empidonax flaviventris. Yellow-bellied fly-catcher. Not common; May breed, but have never found its nest.

ALCEDINIDÆ—THE KINGFISHERS.

Ceryle alcyon. Belted kingfisher. Common summer resident; breeds in the river banks, in company with the bank swallows.

CAPRIMULGIDÆ—THE GOATSUCKERS.

Antrostomus vociferus. Whip-poor-will. Common summer resident; breeds. Have hard work to make people believe but what this and the following are the same.

Chordeiles popetue. Night hawk. Summer resident; breeds, nesting in rocky fields and pastures.

CYPSELIDÆ—THE SWIFTS.

Chætura pelasgia. Chimney swift. Common summer resident; breeds, nesting in chimneys.

TROCHILIDÆ—THE HUMMING BIRDS.

Trochilus columbris. Ruby-throated humming bird. Common summer resident; breeds; have captured several that have come in to the house.

CUCULIDÆ—THE CUCKOOS.

Coccygus Americanus. Yellow-billed cuckoo. Probably occurs, but never taken it, as yet.

Coccygus erythrophthalmus. Black-billed cuckoo. Very common summer resident; breeds. This birds destroys a large number of the eggs of the smaller birds.

PICIDÆ—THE WOODPECKERS.

Picus villosus. Hairy woodpecker. Common resident; breeds.

Picus pubescens. Downy woodpecker. Same as preceding, but more plenty.

Picoides arcticus. Black-backed, three-toed woodpecker. Very rare fall and winter visitor.

Picoides hirsutus. Banded three-toed woodpecker. Rare winter visitor. Took one in the winter of 1875.

Sphyrapicus varius. Yellow-bellied woodpecker. Not very common summer resident; breed. I found a nest of this species in June, 1876; the hole was excavated in the solid live wood, to the depth of ten inches or more.

Melanerpes erythrocephalus. Red-headed woodpecker. Very rare; have seen it but once, and that was about the year 1869, in June; was round a number of days.

Colaptes auratus. Golden-winged woodpecker. Abundant summer resident; breeds.

Hylatomus pileatus. Pileated woodpecker. Rare resident; I think it breeds as it remains here through the summer.

[To be continued.]

ANIMALS RECEIVED AT CEN. PARK MENAGERIE, WEEK ENDING MAR. 17TH.—One Barn Owl, *Strix flammea*, var. *guatemalæ*, presented by Capt. Samuel L. Clapp, steamship Acapulco; one Opossum, *Didelphys virginiana*, presented by Mr. David G. Rode, New York City; one Muskrat, *Fiber zibethicus*, presented by Mr. Stephen Cartwright, New York City; one Guanaco, *Lama huanaco*; ten Dog-faced Baboons, *Cynocephalus porcarius*.

W. A. CONKLIN, Director.

SNUB-NOSED SALMON.—I have received from Mr. William Luckie, fishmonger, 123 Great Portland street, the head of a remarkable salmon. The peculiarity of it is that the upper jaw, instead of assuming the usual shape, has been turned downwards upon itself, thus forming a snub-nose somewhat like that of a pug dog's. The lower jaw is quite perfect. The under surface of the inverted jaw has become quite hard, so that it takes the place of the usual palate This snub nosed malformation is not at all uncommon among young fry just hatched out of the egg. It is found also in half-grown or quarter-grown salmon. Witness the casts in my Museum of two snub-nosed fish caught in the Wye, and presented to me by Mr. A. Miller. The head now presented by Mr. Luckie, was taken from a large fish which weighed 29 lbs. So that it is quite evident that this malformation, which is decidedly congenital, did not interfere with the fish being able to feed well.—*Frank Buckland, in Land and Water.*

A TAIL OF A COON.

ALLENTOWN, Pa., February 1st, 1877.

EDITOR FOREST AND STREAM:—

"I was living down south some years ago; that is to say, in Georgia. One day, Pete, a gentleman of ebony countenance, opal eyeballs and ivory teeth—a thoroughly merry darkey, who was my companion in many a fishing trip—came grinning up to me with something tied up in a pocket handkerchief, and on opening it there rolled out a furry-looking little animal, which proved to be a half grown raccoon, one which, on arriving at maturity, was as tame companionable as a dog. He was a handsome looking little fellow, in his dusky gray coat, white ringed tail, and a patch here and there of white. But it is not of his personal appearance that I wish to tell, but his antics and tricks. In the former he resembled a kitten in the way in which he would roll over, curl his tail, or seize any hand to pretend to bite it; in the latter he was A 1 in the cunning he displayed. Take him down to a lagoon on a moonlight night, and "Dick" would be in his glory. He would scuffle out to an overhanging bough, and thoroughly assimilate himself by it by crouching so close that you would hardly make him out; and he would allow his bushy tail to droop in the water, moving it carelessly about, and waiting for a bite.

He did not wait long, as a rule, for over and over again I have stood and watched him, till I have become aware of a slight movement in the water, when, with a spring that was like lightning, "Dick" would throw himself ashore, and in nine cases out of ten with a crab tight hold of his bush tail.

Then there would be a light scuffle. "Dick" would sit up on his hind legs, with the captive that tried hard to regain the water, hold his prey in his fore paws, and crunch him up with the greatest of zest before going to fish for another.

But they were not crabs which always came to, "Dick's" fishing tackle. Before now a little alligator of some eighteen long had seized it, and been shaken off by "Dick," who evidently did not wish for a nearer acquaintance. The other creatures attracted were a kind of turtle—alligator turtles, we called them—hideous looking creatures, and with a very small carapace, and a long and snaky looking head and neck, armed with a bird-like nipping mouth. I detested the things, placing them next to alligators; but "Dick" liked them, for there seemed to be a good deal of succulent food contained between their shells. These fellows were very easily attracted to "Dick's" tail upon fishing expeditions; they bit readily, but the result was not at all that could be desired.

"Dick" would be crouching on a tree trunk, close over one of the silent, oil-looking reed-fringed pools, when suddenly, as I watched, a snaky-like head would rise out of the water, followed by a lumpy shell. Then another and another would be thrust up, and the owners would silently paddle to the moving fur, look at it intently for a few moments, and then one would make a grab. Evidently knowing his customers, "Dick" would wait patiently to let him get hold fast before making his spring. Then off he would go for shore or the shallows, with as big a bounce as his muscles would sustain; but as a rule the result was only a loud splash, the turtle fell back into the water, and "Dick," had to resume his tactics, and generally without success till a crab came, when with a short bark of delight, the clever little animal would set to and feast.

When, however, by chance "Dick" did succeed in getting his prey ashore, there was no fight shown beyond one sharp snap, made by the turtle, one easily avoided by "Dick," who would seize the reptile by the neck and drag the soft part piecemeal from between the shells; for if he were not sharp over his work, a task was in store for him, the turtle giving up all hope of reaching the water, and retiring within his hard, leathery carapace. "Dick's" motto was evidently "a life in the woods for me," because one one day he ran away into the woods and I never saw him again.

SOURS.

INGENIOUS RATS.—A lady residing in East King street has had a remarkable illustration of that wonderful intelligence in the rat family which we often read about but seldom witness. She had several dozen eggs stored away in the cellar in a large earthern vessel. They were covered with lime water to preserve them. For some time past she was puzzled to know in what manner the lime water leaked out of the vessel, as she could find no traces of a leak, and yet to keep the eggs covered she had to fill it more frequently than it could possibly evaporate.

The other day the servant called the lady's attention to the fact that there must be rats in the cellar, as she had found egg shells in the cork-shavings bin on the opposite side of the room from where the eggs were stored. An examination revealed the fact that one dozen and a half of the eggs had been carried off, and the presumptive proof is that the rats did it, as no other creature had access to the cellar to whose charge the theft could be justly laid.

To get at the eggs in the vessel they would have to rid it of a portion of the lime water, which they evidently drank. This shows that the rat is a capital judge of a good medicine as well as a square meal. Dr. Wood, in the *United States Dispensatory*, says that, mixed with an equal measure of milk, which completely covers its offensive taste, it is an excellent tonic, and one of the best remedies for irritability of the stomach; that he has found a diet exclusively of lime water and milk to be more effective than any plan of treatment in dyspepsia accompanied with the vomiting of food. No doubt Dr. Rodent has discovered that the albumen, margarine, and olein of the egg, combined with the lime water, is quite as wholesome and palatable as the milk, and that the stomach of a hungry dyspeptic rat is just as good a place to mix them in as the nurse's medicine glass in the sick chamber up stairs.

Dr. Rat is well known to be as ingenious in mechanical devices as he is *au fait* in the cuisine and materia medica of cellars and pantries. How did he lift the eggs up two inches on the edge of the crock, and then lower them twelve inches without breaking them? We know that he engineers their transportation long distances by causing one rat to lie on his back while others roll the egg upon him, which he clasps and holds firmly in all fours, as the "sappers and miners" drag him off by the tail to those subterraneous results of rodent engineering which housekeepers detest but can seldom find, or close when found. This tail of the rodent, by the way, is a most wonderful piece of mechanism. It has more muscles than the human hand; it is, in fact, a chain of moveable bones and muscles, and is covered with minute scales and short, stiff hairs, rendering it prehensile, and capable of being employed as a hand, balancer, or projecting spring. It was no doubt a great help to the engineer and his corps of assistants in safely lowering the eggs from the top of the vessel to the floor.

But this perhaps is not as astonishing as a well authenticated incident which took place in the same cellar a few years ago. A quantity of eggs were placed on a shelf laid on light frames suspended from the joist. The shelf was six feet from the floor, and the only connection with the joist above was by the wooden pendants, the size of ordinary roofing-lath. The eggs disappearing mysteriously, a search was instituted, and three of them found at the entrance of a rat hole in an opposite corner, two of which were whole and sound and one shell empty. It was clear that the theft was the work of the rats. That the process of engineering by which they were removed must have been ingenious, no one can reasonably doubt. Just how it was done we are not prepared to demonstrate.—*Lancaster (Pa.) Examiner.*

—At a lecture a few days ago in Chicago, a letter was read from John G. Whittier, who, speaking of the advance of modern science, said:—

Admitting the theory of evolution to be true, I do not see that it need disturb the feelings or faith of the religious world. No deductions or science can change the facts of sin and holiness. We know that something calls upon us to be pure, true, merciful and just—that something holds us to the great idea of duty. This to me is God speaking directly to me, as He does to all; and because he asks me to be good I know that He is good. Here is a rock with which geology has nothing to do.

Woodland, Farm and Garden.

For Forest and Stream.

SOWING.

I WONDER if the brown earth feels a pain,
When the plough turns up the soil?
If it feels the weight of the tiny seed,
Dropped in by the hand of toil?

Ah! the farmer knoweth the soil he tills,
And if earth doth feel a pain,
In silence it taketh the precious seed,
And yieldeth the autumn grain.

O, ye sorrowing hearts, grief ploweth deep—
Think not of thy bitter pain;
But nourish in silence the seed He drops,
Who counteth thy harvest's gain. —E. M. WOODS.

WILDERNESS GARDENS.

ON reading over the article on "Country and Suburban Residences" we were irresistibly reminded of a beautiful shooting lodge beside a Scottish Loch; of one on Lake Hopatkong, where we spent many happy hours; and of another (though much more elaborate) near New York. Each of these was built with reference to use as well as beauty, but it was the surroundings that took our eye, and carried our hearts by storm. They had of course their vegetable garden, etc., removed to some distance in the rear of the cottage, though of easy access for the fragrant mint, or the cooling strawberry. (One had a neat grapery or two) but to us their chief beauty was in the abandonment of all straight lines, walks of close cut grass where you would look for gravel. A knoll of cedars there, fragrant with spicy odors; there a group of scarlet maple, that will shine like a picture set in dark green, in the fall months, when the gorgeous colors are lighted up by the setting sun; beautiful plants, too, in profusion where least expected, here a group of *Œlens* or *Salvias*, to lighten up dark or grey; there *scarlet geraniums* or *Centaurea*, beds of *Portulacus verbenas*, *Monthly roses*, a bunch of *Gladioli*, here and there a noble plant of *Tritoma*, or the lovely *Pampas grass*, standing out like sentinels, or fading off in the distance; all was charming, but the chief beauty was the naturalness (if I may use the term) of the whole surroundings. We most thoroughly endorse your correspondent's remark:

"In nine cases out of ten it is better to build the house to suit the trees, than to clear a site by their removal. The loss sustained by cutting down some majestic elm or knarled oak is irreparable, and no man, with a soul worth saving, could be guilty of such an enormity, unless the operation be a necessity of the most imperative kind. If they obstruct a particular view, it is better to make a window somewhere else, from which the prospect can be enjoyed."

Here the "forest primeval" was judiciously thinned. At one tree a *Bignonia radicans* was planted, at another a red or white *Climbing rose*; by some sharp angle you come upon a gorgeous *Clematis azurea*, or the lovely *Virgin's Bower*, and anon in some bosky dell, or on rustic bridge or arbor, the *English Ivy*, or perhaps the *Virginian Creeper*, showed their glossy foliage. *Maurandias*, *Physianthus Cobeas*, and other climbing plants, were all called upon, and responded nobly, even the flaming *Nasturtiums* was made to do homage, and add to the general fitness of things, while festoons were carried from tree to tree and the birds seemed to vie with the flowers in making the place a Paradise.

Closely shaven glades and wide grass belts wound all around the place, lovely views here and there of bay, or lake, or mountain side, a rustic seat beneath a fragrant honeysuckle, with its humming birds—all free from needless or offensive geometrical twirlings, on barren expanse of graveled surfaces, and all kinds of puerilities, old-fashioned or new-fangled; just such a paradise as a hard worked business man can enjoy—and make enjoyable—during the summer months; make him forget (if possible) his ledgers and his stocks and make his friends happy in, because being, removed from the conventionalities of life, they live more naturally, and through studying nature in her various moods, "Look through Nature—up to Nature's God." W. J. D.

IVIES.— In the garden ivy is more extensively used than formerly, the green, free-growing kinds as edgings to walks; the closer growing kinds as coverings for banks, rockeries, and rooteries; and the choicer sorts for staircase, hall, corridor, or even for conservatory decoration. For all these purposes ivy is particularly worthy of being employed, while for covering low walls in almost all sorts of positions, and with all aspects, a collection of the choice variegated kinds is extremely ornamental.

As pot plants for associating with groups of flowering plants, well-trained specimens of ivy are not only among the finest, but are the most easily preserved and permanent of plants. How effective pyramids of ivy are was shown at the great show at South Kingsington last year, when the nurserymen made the grand and spontaneous offering of the best of their collections, producing an exhibition which has not been equaled in London for many years. Fine as were all the collections then exhibited, rich, valuable, and rare as were many of the plants composing the groups—yet, no bank was more strikingly ornamental, or won higher encomiums of praise, than the group of specimen ivies associated with *Lilium auratum*, from Mr. C. Turner, of Slough.

Ivies in a small state are also admirable for the furnishing of window boxes, balconies, hanging baskets for indoors and out, and the variegated kinds for lively edgings of flower-beds in winter. The uses of this plant in its several varieties are so manifold that there is no wonder that the demand for plants is increasing year by year, and very large supplies have to be provided to meet the ever-growing requirements for this new popular plant. Some sorts are of slow growth, but that is an advantage for many purposes of decoration, admitting the plants to places, where luxuriant flowers would be quite unsuitable—*London Journal of Horticulture.*

MASSACHUSETTS HISTORICAL SOCIETY.—Through the kindness of Curtis & Cobb, seedsmen, Boston, we are in receipt of a copy of the Constitution and By-laws, Schedule of Premiums for 1877, and the Transactions of the Massachusetts Horticultural Society for 1876.

This society is undoubtedly the most flourishing in this country, having a large membership, and quite a large income from its hall and stores, independent of its receipts from Mt. Auburn. The weekly meetings are well attended, and the large exhibitions, notably the Azalea and the fall exhibitions, bring out a wealth of floral beauty rarely seen in this country at least. To a stranger these weekly meetings are doubly valuable, and the members vie with each other to make him feel at home in the "Hub."

As for their library we will let Mr. Buswell speak for himself: "I only wish the library could be made more valuable by more frequent and constant use. It is to-day the best of its kind in the world, but is beneficial only in proportion as it is consulted.

The visitors to our rooms, for the use of the library and for mutual intercourse increase in numbers year by year, to a degree truly encouraging. Friends of horticulture abroad will please accept an invitation, to make our rooms their head-quarters while in the city. Our members, of course, need no invitation.

SUNFLOWERS AND MALARIA.—This subject received some attention about three years ago, when a conversation between General Sherman and the correspondent of a London paper, respecting the pestilential marshes around Rome, was published. The General said: "We utilize such places, and make them healthy; we just sow them with Sunflower seed—common Sunflower—and that does it." My own experience points to the same conclusion. Taking up the cultivation of the Sunflower a few years ago, my attention was forcibly drawn to the subject of its extensive cultivation having a markedly beneficial effect on the surrounding atmosphere, by the fact that one season the village near which I resided was visited by a severe epidemic of scarlet fever and typhus; many children died—one in a cottage, where the whole family was prostrated at one time, not a hundred yards from my own house. All my family escaped without a touch of sickness. I had at that time about sixty very large Sunflower plants in my garden surrounding the house, many of them being twelve feet high. My personal experience of the efficiency of the cultivation of the Sunflower as a preventive of miasmatic fever has been fully borne out by other and worthier authorities, of whom General Sherman is one. A landowner on the banks of the Scheldt sowed the Sunflower extensively on his property near the river, with such effect that there has not been a single case of miasmatic fever among his tenants for years, although the disease continues to prevail in the neighborhood. The medical men in France, Italy, and Germany, believe the cultivation of the Sunflower to be effectual in removing the sources of diseases. It may not be generally known that the Sunflower absorbs, during its growth, a vast quantity of impure gases; it feeds largely by its leaves, absorbs nitrogen more rapidly than any other plant, and will evaporate as much as a quart of water daily. I am convinced that the cultivation of this much neglected plant on a larger scale would not only be beneficial, but remunerative. The fibre can be used for making paper; the ripe seed is most useful as food for poultry, especially during the moulting season; from it a fine oil—second only to olive—is extracted; the leaves are much relished by rabbits, and the thick stems may be used as fuel.—*Public Opinion.*

AUTUMNAL-TINTED VINE LEAVES.—I know of no leaves which become more richly tinted in autumn than those of certain varieties of Grape Vine, a houseful of different kinds of which presents at that season as interesting and diversified an appearance as a mixed plantation. The leaves of Barbarossa attain the finest of hues, which consist of golden-yellow, vivid reddish-scarlet, and deep green. In some the center is yellow, belted with crimson and edged with green; in others these colors are reversed. These markings are not confined to decaying leaves, but also exist on fresh foliage, whose veins and tissues are full of sap. In some places leaves of this kind are sought after for garnishing; this variety of Vine is, therefore, alike useful in autumn for its delicious fruit and its strikingly pretty foliage. Old planted out rods of the Black Alicante

keep their leaves quite green up to the very last, when they become yellow and decay; but the leaves of young one year old canes of this variety are exceedingly beautiful. Long before they are ripe they assume a bright red color, charmingly suffused with yellow; these, like the leaves of the Barbarossa, are very useful and elegant for purposes of decoration. The foliage of Lady Downes becomes spotted, but not in a pretty way. Gros Colman has very peculiar leaves, the edges of which, about mid-summer, become withered up as if scorched by fire or badly attacked with red spider, and by autumn they present a very withered appearance. This is the character of the variety, and when looking worst it is, nevertheless, in perfect health. West's St. Peter's, on the contrary, is a variety worth growing as a climber, on account of the beauty of its foliage alone, which early in autumn becomes bright scarlet, beautifully veined with green. Barbarossa, Alicante, and West's St. Peter's have all foliage of the most attractive.—*The Garden, London.*

OBSERVE AND WORK.—All our clever men, but more particularly gardeners, have attained their knowledge by making good use of their eyes, and closely observing what is going on around them. Knowledge cannot be crammed in by bald dictation. You must teach as Nature teaches, gently, softly, kindly, a little now, a little then, a little here, a little there, a little this way, a little that way. See how Nature trains her plants in the fields. If you have gone into the corn-field early in the morning, you will doubtless have seen the little drop of dew on the top of each white ear, standing there, and asking as it were the sun to kiss it, and impart to it some new chemical virtue, and having been kissed by the sun, it looks, figuratively speaking, for a little groove, a little canal, a little fissure in the plant, and runs down that fissure to the root and nourishes it. That takes place every morning, and what is the consequence? Why, in due course, there is the ear filling all round the top of the stalk. A number of rows, in each row, a number of granular buds. When the summer sun shines out the dew drop is formed, and these little granular buds swell—they harden, they swell again, and harden again—the sun shines out still more bravely, and there you have "the full corn in the ear," which bows its head and ask the reaper to take it in.—*Henry Taylor, in Gardener's Magazine, London.*

THE CINNAMON TREE.—This tree flourishes in a white quartz sandy soil, and in its cultivated state it is never allowed to exceed the dimensions of a bush, being pruned down close to the ground every year. This system of close cutting, induces the growth of a large number of shoots in the same manner that Withies are produced in England. Every twelve months these shoots attain the length of six or seven feet, and the thickness of a man's finger. In the interim the only cultivation required is repeated cleaning. The whole plantation is cut down and the sticks are then stripped of their bark by the peelers. The practise of the natives in this employment naturally renders them particularly expert, and in far less time than is occupied in the description, they run a sharp knife longitudinally along a stick, and at once divest it of the bark. On the following day the strips of bark are scraped, so as entirely to remove the outer cuticle. One strip is then laid within the other, which upon becoming dry contract and form a series of enclosed pipes. It is subsequently packed in bales, and carefully sewn up in double sacks for exportation. Although the Cinnamon appears to require no more than a common quartz sand for its production, it is always cultivated with the greatest success, where the subsoil is light, dry, and of a loamy quality. Cassia Bark is much like Cinnamon, but thicker, coarser, stronger, less delicate in flavor and cheaper, hence it is frequently used to adulterate Cinnamon.—*Baker's "Eight Years in Ceylon.*

TO REMOVE LICE ON CATTLE.—A good scrubbing with soft soap and water will remove them. Linseed oil, or any other oil prevents their migrating, and destroys them; but the efficiency of the oil is increased when to every pint is added an ounce of impure carbolic acid, or of Burnett's Zinc choloride solution. Decoctions of tobacco and staves-acre also poison the vermin, an ounce to the pint of water being generally used. When the animals have been much infested, a second dressing should take place about a week after the first, and brushing, cleanliness, and usually a more liberal diet be given.—*North British Agriculturalist.*

Sea and River Fishing.

FISH IN SEASON IN MARCH

Brook Trout, *Salmo fontinalis*. White Perch, *Morone Americana*.
FLIES FOR THIS MONTH.
Dark Fox and Black, Grey and Claret Gnats, on 13 hooks (small).

FISH IN MARKET.—It is eminently proper for us, under this head, to chronicle the opening of the trout season as applied to our fish markets. It has been the custom of Mr. E. G. Blackford, of Fulton Market, to have an exhibition of live and dead brook-trout on the opening of the season each year. Last Thursday, a large number of gentlemen responded to Mr. Blackford's invitation; among them Prof. E. L. Youmans, Hon. R. B. Roosevelt, Mr. George Sheppard Page, Mr. W. C. Coup, Mr. A. Booth, of Chicago, Mr. Fred. Mather, and many others. The display was really magnificent, comprising trout from the following fish culturists and dealers: Ira Smith, South Oyster Bay; John P. Mowatt, Campbelton, N. B.; Eugene Dupries, Jolliette, Canada; Gardiner, Kittredge & Sherman, New Bedford; Seth Green, Caledonia, N. Y.; H. F. Douseman, Fish Commissioner, Wisconsin; Levi Heywood, Fish Commissioner, Massachusetts; J. B. & F. W. Eddey, Randolph, N. Y.; George Wetter, Oak Grove, Trout Pond, Franklin Co., Pa.; Robinson Osterhaut & Co., Moscow, Pa.; Livingston Stone, Charleston, N. H.; Michael Gregory, Patchogue, L. I.; and M. T. Brewer & Co., Sacramento, Cal., Truckee River trout. In addition to the fish temptingly displayed on the slabs, Mr. Blackford had aquariums scattered about with fish of every age, from the little fry to the one-pounder. The process of hatching the eggs was also exhibited in Mr. Ferguson's parlor hatching-apparatus. Altogether, the display, which we regret we cannot describe at greater length, was a great success.

QUOTATIONS.—Striped bass, 18 to 20 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen 25 cents; California, 45 cents; shad (southern), 50 cents each; mackerel, 30 cents; white perch, 15 cents; Spanish mackerel, 50 cents; green turtle, 20 cents; terrapin, $15 per dozen; frostfish, 8 cents per pound; halibut, 18 cents; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 8 cents; sea bass, 20 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 20 cents; turbott, 20 cents; scollops, $1.50 per gallon; whitefish, 15 cents per pound; pickerel, 15 cents; Canada brook-trout, 20 cents; Long Island trout, $1.20; Maine trout, 50 cents; hard shell crabs, $4.00 per 100; red snappers, 18 cents.

OPENING THE TROUTING SEASON.—On Wednesday of last week, the 15th instant, with oyster-knife and corkscrew, the ardent anglers formally opened the trouting season on Long Island. Most artistically and comfortably was the feat performed. For several days previous the weather had been April-like and mild, encouraging the jubilant fish to skip to the surface in quest of the insect life which the warmth of the air was likely to coax from the egg, and promising to anglers all that their fondest hopes encouraged; but when the morning of the 15th dawned, there was frost enough in the atmosphere to render exercise indispensable to the warmth of the youngest blood. There was no snow, but the clouds threatened, and on the next day evening it came, and has whitened the ground ever since. Nevertheless, those ancient anglers, who have been accustomed for forty years to brave the caprices of March weather in this climate, strode determinedly forth to the ponds and streams—just to keep up the form—and when their lines became stiff with ice, strode shivering back to their respective quarters, to discuss, over blazing fires and flip, the vicissitudes of previous years; but not without due exercise of their respective powers. That veteran bass fisherman, Genio C. Scott, slung his favorite eel-skin far out beyond the breaking surf that rolled in upon the shores of Massapiqua, and taking a delicate rise, played his captive well, and brought him handsomely to gaff, serving him afterward, in good style, on one of his latest fashion plates, *a la maitre d' hotel.* Recorder Hackett, at the South Side Club, took a three-pounder neatly, on the fly, with his Derringer pistol, hitting him square in the eye, and bringing him to bag and grief. That returned Californian, L. A. Abbey, whom no one had seen since the golden days of 1849, was on hand at Oyster Bay, with his favorite quinquplexal lures, and astonished his quondam friends by the alacrity with which he assisted at the "opening," as in the early days gone by. The Hon. Robt. B. Roosevelt hung out his latch-string to a host of friends, who accompanied him to his splendid pond to see him cast for distance. It is claimed, by those who measured his line, that he beat that famous cast of Seth Green, at the State tournament, which forever after barred him from participation in contests of that kind. So bountiful was his table spread with trout that night, that a new order will have to be sent to the State Fish Commissioners for additional stock. And so it was all up and down that sea-girt shore. Jesse Smith and the boys at Babylon drove to Carman's with their teams, snugly ensconced in robes and blankets, with hot bottles at their feet; and drawing rein at the edge of the pond, cast their flies into the water, and hooking to a fish apiece, instantly whipped up their nags and drew their prizes to shore at a 2:40 gait, never stopping until they had reached their headquarters, shivering. At Lorillard's there was a goodly party, plucky, but disconsolate, who never referred to gun or touched on "horse;" but simply talked fish the long day through, as knowingly as others better versed in fish-lore. The tall Du Bois Wagstaff, towering above the other sons of Walton, cut himself a wattle from the top of the tallest willow, and sent his boy to the green-house for angle-worms; but the boy was gone so long, that he became disgusted, and oiling his rod, put it carefully away in his gun-case. At Wilbur's new shooting-box there was a pleasant party of sixteen, who surrounded five good trout and captured them; which fish, with a proper quantum of bread, made the *pieces de resistance* on the Monday following at a fashionable *dejeuner* served at the Westminster Hotel by W. H. Elder, Esq. The waiters took up twelve baskets of the fragments that remained.

On the North Side of the Island the occasion was equally exciting, though the wind was colder, and the night-caps naturally a little stiffer. The central and divergent railroads were crowded all that day (the 15th) and the day before with anglers in full professional panoply, going down to the hospitable resorts of friends below; and President Poppenhausen & Co. never did a better business for the same amount of pay.

Alas! the Island is not now "as it used to was" in the good old days gone by, when we used to gather around the blazing fires at Conk Vandewater's and Austin Roe's, and Aaron Vail's; when Scott, and Brainerd, and Hyde, and Dr. Wood, Judge Davies, and all that ilk and generation, invested the hallowed precincts with an ichthyo sanctity which would have delighted the Apostle Peter and all the fishermen of Galilee. Then there were no spacious mansions of retired New-Yorkers along the shores, no private ponds and exclusive club-houses; but all fishing was free, so to speak—the ponds had not been poached bare, and anglers cast their lines in pleasant and not doubtful places. It seems now as if the seasons were milder then, and one was usually well repaid after his four-mile drive in the tedious sand from the Central Railroad to the appointed places. Besides, the seasons "opened" differently then. Perhaps there wasn't so much of an opening, but it was opening enough to have satisfied Jonah, or any other man accustomed to a swallow or two; though it is fair to say that the weather was sometimes cold and stormy, and that, so far from being spring-like or summerish, experienced men came to know that one swallow, or two, did not necessarily make a summer.

Whatever of a seemingly unseasonable character may attach to the time-honored custom of the old habitués of these island waters, we hope the opening may never be suspended, but continue to open through many generations to come, though, for ourselves, we should prefer it on the 1st of April.

DEEP TROLLING IN LAKE GEORGE.

LAKE GEORGE, N. Y., March 3d, 1877.

EDITOR FOREST AND STREAM.

Having promised to give you a full description of the fish in the waters of Lake George, I now furnish the same, which is as follows, commencing with that famous fish known as the "forked tail," or salmon trout. When a small boy, say over forty years ago, my father used to occasionally go a fishing for what he termed "them lake trout," and he was very seldom unsuccessful. When he had taken what was required he would always stop, take in his line, and say, "that will do, we have got enough for a mess, now we will go home." I remember of his going out one morning in the month of May with his trolling line to take some trout. He had been gone but a short time, when he returned to the house with one fish weighing about eight pounds. When asked if that was all that he had caught, he said, "Yes, that is enough for us all, and more than we can eat. Never catch more than you want to eat or give to your neighbor, because they bite; then we shall always be able to get a mess when we want them." His motto was: "Never catch more than you can make use of, and always dress and take care of what you do get, if it is but one." How few of our sportsmen at the present day think of the generation to come? There would not be the necessity of being to that extra expense of hatching and transporting to our waters yearly, as is now done, so many thousand little young fish, in order that it can be said that we have trout in abundance; for, with such economy, our waters would naturally be well supplied. Game laws would be unnecessary. There have been yearly, for some few years past, from twenty to sixty thousand young trout brought from the noted hatching establishment of Mr. Green, and turned into the clear waters of Lake George. Sixty thousand were put into the lake last month. There are now being taken daily hundreds of trout, weighing from four ounces up to ten and twelve pounds. There are quite a number of men who make their living by the sale of fish taken from the waters of Lake George; even the wives and daughters of these men spend their spare time in fishing. I have at this present time a trout that is doomed to be eaten by myself and family, that was taken by a woman, of whom I bought it on my return from the north end of the lake, where I had been to see a horse trot on the ice.

Since my remembrance, there never has been so fine sleighing on the lake for man or horse as there has been during the month of February. Boating has become stale. Youngsters from twelve years of age, up to the men of years, have had so much sailing that they have become tired of it. Trout fishing ten years ago was supposed to be nearly used up; but the ingenuity of man generally finds means to gain his points, let the case be what it may. Experiments for trolling in deep water were made by two or three of our best fishermen, and they soon got their plans so complete that they could troll in any depth of water from twelve to two hundred feet. The difficulty to overcome was, to have the bait run within two feet of the bottom, and not go to the bottom and get snagged. They have got it to perfection. I give you the manner in which it is done.

To troll at the depth of one hundred and fifty feet, use a small silk line, braided or hawser laid, oiled, three hundred feet long. On a heavy, single gut, make a gang of No. 6 and 8 Burr hooks. At the end of the line attach a small brass swivel; to the swivel attach the gang; from ten to thirty feet from the gang attach a small piece of much weaker line than your silk line, with a lead weight, weighing from eight to sixteen ounces, at the end. This line will be varied in length, according to the distance that you want your gang to run from the bottom. The longer the lead line, the higher the gang will run from the bottom. The object of using a weaker lead line is, if the lead gets fast, you can break the line with the silk, save your gang, attach another lead, and go on. With this invention it was found that Lake George contained numerous large trout. They have taken, and still continue to take, numerous quantities of these large trout. They run often to 8, 10, 12, 14 pounds, and have been taken to weigh 16 pounds, during the season of 1876. It shows that the more dainty the bait, the quicker the large trout become your game. By still fishing, the small ones are caught, the large ones not being so easily captured, although they are occasionally so taken. A small shiner is the best bait to put on the gang.

The inhuman practice of spearing trout is not so frequent as it was a few years ago; but it is done down among the mountains by some lawless wretches, that live between Lake George and Lake Champlain. Their practice is being broken up, and it is to hoped that, by next fall, it will be entirely stopped.

THE OLD PILOT.

BLACK BASS FISHING IN WINTER

WINCHESTER, Va., March, 1877.

EDITOR FOREST AND STREAM.

As the Black Bass seems to be the "coming fish," and the one that appears, at present, to most fully occupy the attention of the genuine angler, it may, perhaps, prove interesting to your Waltonian readers, to inform them that I have lately enjoyed considerable sport in angling for these noble fish, at a season when most fishermen are of opinion that they cannot be induced to take any bait. About the middle of last month, during a period of very mild weather that we were blessed with in this locality, I repaired to the banks of the lovely Shenandoah, for the purpose of angling for the yellow sucker—a species of carp of excellent flavor, but of little interest to the scientific angler, as it is exclusively a bottom biter. The bait employed was that commonly used in the capture of this fish, viz., the common angle or garden worm. I had not been engaged in my occupation long, before a heavy tug at my rod assured me unmistakably that a fish belonging to a family far different from the *Cyprinidæ* had given me the benefit of his patronage, and upon landing my customer, which I did, after a long and severe contest, I was delighted to find that I had captured a fine black bass, weighing about three pounds. I was, of course, much gratified to discover that this noble fish could be captured at a season when most anglers have laid aside their tackle, as the circumstance foretold an unlimited amount of sport in the future.

I continued my amusement for several hours, catching bass about as often as suckers, and at the close found that I had captured eleven beautiful bass, weighing in the aggregate sixteen pounds. I spent several days upon the river, securing, in all, seventy-five pounds of as pretty bass as I

ever saw taken from its prolific waters. The most successful mode of baiting was to run the hook through the heads of several living worms at a time, their efforts to escape seeming to attract the notice of the bass. The water fished in was quite clear, and the locality a deep pool at the foot of a long reach of shallow water, where the fish had apparently collected in great numbers during the rigorous weather of the earlier part of winter. The fish bit with great voracity, and were evidently very hungry, as the empty stomachs of those examined clearly indicated. It must be remembered, that the weather had been extremely mild for a fortnight previous to the time I commenced fishing, and I very much doubt whether similar success would attend efforts to take these fish during very cold weather. However this may be, I intend hereafter to experiment upon them with different kinds of bait, and at all stages of the water and conditions of the weather, and will be pleased to give your readers the benefit of my experience. A. W.

FLY-FISHING FOR BASS.

PHILADELPHIA, March 12, 1877.

EDITOR FOREST AND STREAM:—

Is it not about time that fly fishing for bass should be called something else than a "problem or question"? We wish "to add a little" to the testimony already collected by you, showing that bass *do* rise to a fly, and that more fish, and larger ones, can be taken with a fly than with bait.

We had never cast for bass until last summer (our efforts hitherto having been directed chiefly against brook trout), and although we fished a comparatively unknown stream (as far as fly-fishing was concerned), our success was a pronounced one. The river Shenandoah in Virginia was the scene of action. With little knowledge of the habits of the fish, and less of that river, we had little difficulty in taking more fish than the best of bait fishermen. When the water was not muddy, we usually took from 20 to 30 bass in an evening, the fish averaging over half a pound in weight. The largest fish caught by us weighed four and a quarter pounds. We noticed few points that have not been touched upon in your pages. Commencing operations early in May we fished more or less until late in September, and found July rather the best month, and after 4 o'clock in the evening the best time for fishing. We had little success in deep still water, taking them usually in moderately rapid water, three or four feet in depth, and at the extremities of pools.

Bass do not rise as prettily as brook trout, frequently taking the fly from six inches to a foot under the surface of the water, but being fully as game a fish as the trout, their larger size fully atones for any lack of "style" in rising, as to flies. We found the dark ones most killing. That the black bass is to be the "game fish of the future," we feel convinced, and indeed look for a great improvement in the art piscatorial, from the fact of there being such large numbers of the fish so near home. Every inducement is offered to the angler for bass, short distances to be traveled, open streams, and large game fish. Let fly-fishers take courage, and in time the bottom fisher, with his sinkers, poles, and whistle, will be a thing of the past. We believe in using trout tackle for bass, and know of one instance in which three large bass were taken at one cast with a rod that weighed little over six ounces. THE HORATH.

YELLOW PERCH OF OWASCO LAKE.

AUBURN, N. Y., March 5th.

Owasco lake, in the county of Cayjuga, is bound in by ranges of hills, down which, in sparkling rills, over rapids and cascades, come the minor tributaries of the lake. Two and a half miles from the foot of this lovely sheet of water, which is 750 feet above tide, twelve miles in lenghth, and one in width, is the beautiful city of Auburn. The lake contains trout and perch, and in limited quantities, bass and pickerel, the latter by introduction, much to our regret. Sitting upon the beach, in front of my lake cottage, one beautiful afternoon in August last, I observed frequent swirls upon the calm surface of the water. I immediately armed myself with my "old Conroy," that had done good service on the Muskoka, Beaver River, among the Adirondacks, on Pine River, Bowman's Creek, Salmon River, and Beaverkill, and pushed my skiff to within a reasonable cast of the disturbance. With a brown hackle for the stretcher, and a couple of gay droppers, the first cast was made, and two fine half-pound perch were struck. "Business" continued good and exciting for some twenty minutes, when one account of stock showed two dozen of as fine fish as one often sees. This was my first experience in taking with a fly any but fish of the real speckled persuasion, but it was evidence conclusive, in the absence of an opportunity to drop the "artificial" over the "real beauties," that good sport may be had, under favorable circumstances, with the yellow perch.

J. LEWIS GRANT.

THE NORWAY COAST FISHERIES.—About the latter part of January, the inhabitants of the Northern Ocean belonging to the cod family migrate toward the coasts of Norway, and in certain localities literally fill the water. As a Norse writer puts it, one might be inclined to believe that all the cod in creation had appointed an annual rendezvous under the banks of Lofoten. At times the vast shoals almost impede the progress of the boats, and frequently the "deep nets" with their heavy sinkers stop before reaching the bottom, being unable to push their way through the dense throngs of fish. Then the male population of the northern districts make ready their elastic, swift-sailing boats, and hurry out toward Lofoten, and only women, children, and decrepit old men remain behind in the valleys. It is a fine sight to see the vast fleet sailing out at the break of dawn toward the fishing-grounds, and again returning with the heavily-loaded boats, followed by a surging cloud of white, screaming seabirds. The winter fisheries usually close about the middle of April, and, about a month later, the summer fisheries commence. These, however, are not confined to the islands of Lofoten, but extend up the whole coast toward Russia. They do not yield so large a profit as the former; but, on the other hand, they are less dangerous, and even women are not prevented from engaging in them. The night is then as bright as the day; the weather is steady, and storms are rare. The midnight sun hangs large and red above the horizon's rim, throwing its broad bridge of flame out across the sea. —*Scribner's Monthly.*

AN ADIRONDACK FISH STORY.—A correspondent sends us the following as he received it from the lips of Dr. M., who gives Sinonds, of Elizabethtown, N. Y., as his authority, cautioning us, however, to receive it *cum grane salis*:—

"One day last week a gentleman, accompanied by his son, a lad of about ten years of age, went to Newcome Pond to fish through the ice. Meeting with unusual luck they decided to remain over night and fish the next day. In the morning the son, having opened his hole in the ice and safely landed two or three fish, was astounded by a bite that seemingly could only have come from the monarch of the lake, or a ward politician. Drawing up his line he beheld his quarry gazing at him through the hole, a large, hairy monster. Obeying his first impulse he chopped his line and retreated. After a moment's hesitation, however, he mustered courage enough to make another attempt to bag his game, whatever it might be. Again drawing up his line, the animal (undoubtedly suffering for want of air), with commendable consideration, landed himself on the ice at the boy's feet, who immediately killed him with the axe. It proved to be a very large and full grown otter. Its skin brought $12. SCOBIA.

Vergennes, Vt., March 9th, 1877.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

C. M. WIGGINS.—Please send your address to M. P. McKoon, Franklin Delaware County, N. Y.

J. F. B. S., Kingston,—The Moore gun is sold. This will answer many inquirers.

"CANOE."—We have lost your address. Please send it. You wrote an article on the Androscoggin lately.

G. A. S., Toledo, Ohio.—Where can I obtain the felt wad? Ans. From any gun dealer advertising in our columns.

CARTER, Philadelphia.—What taxidermist, in this city, can you recommend? Ans. George Boudroin, and John Krider, among others.

W. B., Detroit, Mich.—Can you refer me to a good work on trout fishing? ANS. "Domesticated Trout," by Livingston Stone.

H. H., New York.—Is there a place in this city kept by Ira Paine for practicing at glass balls, and where is it? Ans. There was such a place, in Prince street, but Paine is in Europe, and it is closed.

J. E. LE C., Philadelphia.—Please inform me of what kind of shooting there is at Atlantic City, between 1st and 15th of April. Ans. If you happened to strike the beach during the spring flight of bay-birds, you would have some sport; but the ducks would be apt to have passed by the dates you mention.

K. L., New York.—1st. Please tell me what is the best running-jump on record? 2d. The highest? 3d. Where could I get a good second-hand rifle? Ans. 1st. With 5 lb. dumb-bells, 29 ft. 7 in., made by John Howard, in England (1854). 2d. 6 ft. 2½ in., at London, by M. J. Brooks, April 7th, 1876. 3d. From Homer Fisher, Broadway, corner of Warren street, this city.

D. R. C., North-East, Pa.—I want a dog for running rabbits, hares, and foxes, with a view of shooting them. What kind of a dog shall I purchase? Will beagles run foxes well? and do they give tongue freely and loudly, as much so as a fox-hound? Ans. You want a fox-hound. Beagles would follow a fox scent, but if they have been used for rabbit hunting, would probably leave one scent for another.

C. J. P., Philadelphia.—Please inform me where I can go to get board, and good gunning and fishing can be found, such as deer, duck, and smaller game? Ans. We can not tell you where you can find fishing duck, deer, and small bird shooting, all at the same time and at this time of the year. At the proper season, say in winter, you could accomplish it at Homossassa, in Florida.

C. H. B., Uniontown, Pa.—I wish you would please inform me where, and at what price, I can get 200 or 300 live wild pigeons, suitable for trap shooting? Ans. We cannot advise you at present where you can buy wild pigeons. Those States in which the birds nest have passed stringent laws for their protection, and they will be hereafter difficult to procure.

A. C., Yonkers.—Please let me know the nearest place where I could buy small trout, or other young fish, to stock a brook and a little pond of 400 by 20? Ans. Apply to H. H. Thomas, Randolph, Cattaraugus County, N. Y., Stephen H. Ainsworth, Bloomfield, N. Y., or B. H. Porter Oakland, Bergen County, N. J.

R. L., New York.—When will the next meeting of the New York Rowing Club be held? Ans. The annual meetings are held on the first Monday in February; besides those, the club has no fixed meetings. A list of the officers will be found in another column.

W. E. W., Boston.—1st. Where can I get Colonel Dodges' book "The Plains of the Great West," and at what price? 2d. I have two vols. (3 and 4), unbound, of FOREST AND STREAM; also, nineteen numbers of vol. 5. Do you know of a purchaser? Ans. 1st. S. V. Putnam's Sons, 182 Fifth Avenue. We have advertised this book. 2d. Possibly your notification here may bring a purchaser.

H. H. F., Allegheny, Pa.—Is the shooting and fishing good in the vicinity of Lake Pepin, Wisconsin? Ans. Most excellent fishing for black bass, pike, muscalonge, and pike-perch, with the best hotel accommodation at Frontenac, and all around the lake. Good trout fishing in a dozen streams that empty into the lake. Good shooting in season.

C. R., Philadelphia.—Where can good duck shooting be had no further from Philadelphia than seventy five miles? What size bore gun would be best? Ans. In the season, your best point would be Havre de Grace, but it is rather late for duck shooting in that vicinity, and so we should advise you to try Barnegat Bay. A gun for duck shooting is only much a matter of fancy. We prefer a 10-lb., 10-gauge breech-loader, 32-inch barrels, rebounding locks, and choke-bored.

X. Y. Z., New York.—Could I get a few days good duck shooting at Babylon in the month of April? Can you recommend me a good guide? What would be the cost of a trip there, including the price of board, guide, etc.? Ans. We should suggest your going a little further on the island, and trying Good Ground, where your chances would be much better. Write to Wm. Laue, Good Ground, Long Island. Your expenses, including battery, etc., would be about $6 per day.

J. L. P., New York.—1. Will you be kind enough to inform me in your next paper where Kinney Bros., manufacturers of cigarettes, headquarters are in this city? 2d. Where can I purchase Audubon's Ornithological Biography, and at what price? 1st. Don't know the Kinney Brothers. 2d. Audubon, octavo and quarto edition, rare, costing $100. Address T. T. Wilson, 1 105 Filbert Street, Philadelphia.

J. A., Bluff City, Scott County, Ill.—Would you give us a practical article on black bass fishing for the West, giving us the best places to try in the Illinois River or the lakes, and the best tackle, and, in short every thing about it? Also, how do you make a duck call? Ans. You will find in Nos. 2, 3, and 6, of present volume, special instructions in fishing for black bass, with proper flies to use, etc. Previous volumes of FOREST AND STREAM contain very full information of like character.

G. R. H., Glen's Falls, N. Y.—Please advise me which you consider the most suitable for a cat-sail (of 44 square yards), duck, or canvas? the proper weight, and which is the best goods manufactured? Ans. You want duck, of course, but as to size and quality we should suggest that you write to some good sail-maker, say Chester & Kieffe, of Jersey City, who will make you a good sail, and cheap. Send them the following dimensions: Length of mast to top, length of boom, length of gaff, distance from top of mast to stern of boat, and also from foot of mast to stern of boat.

G. E. W., Washington, D. C.—Living at Portland, Oregon, I would like to know the best route to Brazil, the fare from New York to that country, and if there is a line of steamers on that route? Ans. There is no line to Brazil from the United States. The way to go at present, is to take steamer to St. Thomas, and from there, by English steamers to Para. Buy Orton's "Andes and Amazon," second edition, for full particulars.

W. O., Clinton.—Since I bought my dog he has lost all animation, and eats but very little. He drinks a great deal of water, and has an occasional hacking cough, together with some vomiting; runs some from the eyes, and has a diarrhœa. Ans. Give your dog, first, three drachms compound liquorice powder, and afterward a tonic composed of quin., one grain, and carb. of iron, three grains, made in to a pill; give three daily.

YES ON NO, Brooklyn.—A friend and myself went off the other day to shoot squirrels. We came across one after a short walk; the cunning fellow was on the trunk of a large tree, watching us; not being in a suitable position for a good mark, we walked a few feet to the left, but as far as we walked he would run around the trunk just enough to keep the trunk between us and himself; this continuing till we had encircled the tree. Did we, or did we not, encircle that squirrel? Ans. We replied to this question in our issue of April 6th, 1876.

P. D. M., Nashville, Tenn.—1st. Can you inform me of anything that will cure worms in dogs? 2d. What is good for mange, and for sore eyes? 3d. Is there anything that will improve the development of a dog's nose? 4th. What is good for flux? Ans. 1st. Areca nut, in powders of 20 grains each, three being given, and followed by an ounce of castor oil four hours afterward. 2d. For mange, Basilicon ointment, 2 oz.; flour sulphur, ½ oz.; turpentine, enough to mix. Would have to know further about the sore eyes before prescribing. 3d. No. 4th. Describe the symptoms accompanying the flux.

W. O., Clinton.—1st. Can you tell me how I can train my pointer? If not, will you recommend me to some first-class work on the subject? one by referring to which I can train him in a section of country where there is but little game besides partridges. 2d. What is a remedy for canker in the ear? 3d. Will you give me the address of some good trainers in this State? Ans. 1st. You will find the information you want in "Dinks, Mayhew & Hutchinson." We can send it; price, $3. 2d. Twenty grains sulphate copper, in four ounces of water; a little to be poured in the ear twice a day, first washing the ear thoroughly with castile soap. 3d. We must refer you to our advertising columns.

E. A. F., Newport, Ky.—1st. I have a setter, "Gyp," thirteen months old, who has just had a litter of seven pups, but in the last three days every one has died. They seemed to be doing fine, and were very lively, but the mother seemed to be careless of them, and did not give them sufficient care. Is there any remedy for this, or is it on account of her being too young? As all her pups are dead, how long before she will go in heat? I have another, a dog, who has a hacking cough, loss of appetite, and matter in the eyes, but is as lively as ever. What is the remedy? Ans. 1st. You bred your bitch too young, but there must have been some other cause for the death of the pups than want of care on the part of the mother. Bitches are usually in season twice a year. 2d, Your symptoms are rather indefinite, but we should give him five grains of quinine twice a day, and if he does not improve, twenty grains of calomel.

J. MCE., Elmira, N. Y.—1st. Can you tell me the nearest place to Elmira that I can buy some wild pigeons for stools, and price? 2d. I have a Scott breech-loader, 10-gauge, that has got rusted near the breech. Can I have it bored or emerged out, so as not to injure its shooting? Does it lessen its penetration and pattern, or increase it, to make it larger at breech? Who, in New York, can I send it to, and have a good job done, and cost of same? Ans. 1st. See answer to C. H. B. 2d. We should suggest that you show your gun to the nearest gunsmith, and get his opinion about re-boring. The increasing of the bore need not affect its shooting, if it is bored uniformly.

B., New Haven, Ct.—Where in Virginia would you recommend a sportsman to go for a few week 's snipe shooting before the 1st of May? Ans. Mark Horn, Hog Island, and along the tributaries of the lower Chesapeake. Take rail from Wilmington, Del., to Salisbury, and change cars for Chrisfield; or take steamboat from Washington to Cherrystone, and there hire boat or wagon. Any of the branches of the Wilmington road (down the Delaware Peninsula), leading to the Chesapeake or Eastern Shore, will give you all the snipe shooting you want. Chincoteague and Sinepuxent Bays are first-rate places.

E. H., New York.—1st. Please inform me, through your paper, of the cheapest way to get to the (Black Hills) Deadwood City, M. T.? 2d. Do you really think two boys, 18 years of age, could make a living out there? Ans. 1st. Via Bismark, on N. R. R. R., steamer thence to Fort Benton, thence foot it, or steal a wagon-ride for 16 miles. A tri-weekly mail service between Kearney, Neb., and Deadwood, in the Black Hills region, 339 miles, will commence May 1st, and a daily service between Hat Creek and Deadwood, 121 miles, April 1st. There is now daily mail communication with Hat Creek and the Union Pacific R. R. at Cheyenne. The distance from Deadwood from the the railroad is 235 miles. 2d. We really think they could not, and would advise them to be content to stay at home.

INQUIRER, San Francisco, Cal.—1st. Do you consider the breech-loading shot gun made by Joseph Braddell & Son, of Castle Place, Belfast, Ireland, a first-class gun? 2d. Would you advise me to have the barrels of a breech-loader, length 31 inches, bore 10, weight 9 lbs., shortened to 28 inches, or shortened at all; and if so, to what length? 3d. For what can a setter pup, with first-class pedigree, be bought and shipped to San Francisco? Ans. 1st. We do not know from personal inspection the guns of the makers you name, but they have the reputation of turning out first-class work. 2d, The barrels of your gun are not too long for the weight, and if the shooting is satisfactory we should not shorten them. 3d. A pup of good pedigree, boxed and shipped, would cost you about $40.

D. R. C., Northeast, Pa.—We cannot conceive of more favorable conditions for fish culture than your ravine and springs would seem to afford, from your description. If you will communicate with W. H. Crowell, Ludlow, McKean County, or J. B. Thompson, of New Hope, they will probably advise you to stock your water with trout fry. Experiments prove that propagation from the ova is tedious and expensive in the end. You will require no hatching-houses, but simply separate lateral ponds for different sizes of fish—one for the fry, one for yearlings, one for two-year-olds, and one for spawners. If you prefer black bass, adopt *g. salmoides*, the Southern variety. Livingston Stone's work, called "Domesticated Trout," is the best for that species. With regard to bass, all the published matter you can find will not contain as much information as can be collated from articles already printed in FOREST AND STREAM.

E. L. MCF., Scottsburgh, N. Y.—1st; My Gordon setter puppy, six weeks old, has a breach at the navel; the intestines protrude to the size of a hickory nut. Can there be anything done for it, and if so, what course of treatment would you advise? Should he be fed lightly? 2d. Also, one of his eyelids turn in so that the eyelashes come in contact with the eyeball, which makes the eye water badly. What can I do for him? Ans. 1st. Your puppy is afflicted with umbilical hernia. Any good surgeon can perform the operation for his relief by cutting down upon the hernial sac, reducing the hernia, removing the sac of liver peritoneum, and bringing the sides of the opening together by silver sutures. The abdomen should be kept well bandaged for several weeks, or until the wound is healed. The operation should be performed at once. 2d. Wash the eyelids frequently with tepid water, and, unless there is a malformation, the eyelid will grow into proper shape.

FOREST AND STREAM

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,

[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 22, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

☞ Trade supplied by American News Company.

CHARLES HALLOCK,
Editor and Business Manager.

TO OUR READERS.—Owing to the delays attending the substitution of new type for old, our paper this week presents some blemishes which we trust will be overlooked. Next week just look at our new dress and our "form!"

NOTICE TO SUBSCRIBERS.—It is our custom to send to subscribers a notice informing them of the date on which their subscriptions expire, and requesting that they advise us whether or not they wish to renew. If no response is received, the paper is stopped at the expiration of the time for which it is paid. To make exceptions to this rule would destroy all system in the mailing department and lead to confusion; and besides, it is simple justice to treat all precisely alike. If subscribers will notify us promptly, by postal card or otherwise, whether they desire to continue, they will prevent the erasure of their names from our list, and avoid any break in their files of the paper.

CHINESE QUAIL AND CALIFORNIA PIGEONS.—We have received from R. Tallant, Esq., of Cambridge University, two fine ornithological specimens, with the following note accompanying:

CAMBRIDGE, Mass., March 19th.

CHARLES HALLOCK, ESQ.:

One you will doubtless recognise as the wild pigeon of California, not found east of the mountains, I believe, while your Eastern pigeon does not extend to us in California. They are very wild and hard to approach, generally go in small flocks, breed in California, building in tall pine trees. Scientific name, *Columba fasciata*, from the not very distinctly marked band on the tail. The other is the quail of China (not the fighting quail) and the Asiatic Coast; they are found in immense flocks, and are so easily injured by the shot, that it is very difficult to get a good specimen to stuff; but the bird is so small that it ought to be hard work injuring them. R. S.

[Of course we need hardly express our appreciation of the gift, which we shall value very much, as adding two new specimens to our collection.—ED].

—The present condition of journalism in New York city, as compared with that of former times, illustrates the tendency to consolidation and concentration among newspapers—to fewer papers in number, of larger circulation, greater cost, and greater power. In 1840, there were eighteen dailies published in that city, with only 60,000 aggregate circulation; now, there are but sixteen dailies, with an aggregate circulation approaching 500,000 copies. Of these present, one is in the hands of the Sheriff, another is confessedly dying, and two or three have no sufficient excuse for living. Within five years, it is not likely there will be over a dozen daily papers in New York city.—*The Proof Sheet.*

VIRGINIA AS A SPORTING GROUND.

THIS State presents a wide and attractive theatre for the gun and the rod; with water, plain, and mountain, every variety of sport may be had in its season. There are 2,500 square miles of water within its limits, extending from the Potomac to Albemarle Sound, a distance of 130 miles, embracing most of the Chesapeake Bay, and stretching up into the interior, by several large tidal streams, 160 miles. In these waters are found numerous species of fish and every variety of water fowl. On the rivers, too, near the head of tide, sora and English snipe abound in their season in all the marshes. Of these rivers, beginning on the north, we have first the Potomac, then the Rappahannock—the two making the narrow peninsula of 60 miles in length, and 7 to 12 in width, called the Northern Neck—abounding in game and fish; then the Piankitank, and various streams in Gloucester and Matthews—an arm of the sea, as it were, emptying into Mob Jack Bay, a sort of inland sea—then York River, with its tributaries, Mattaponi and Pamaunkee—which make a peninsula of 30 miles in length, and from 2½ to 7 in width, bringing both streams within the range of the gunner and the angler, abounding with fish and fowl, and the dividing ridge with deer, quail, turkey, foxes, raccoons, and opossums. The sportsman, with an humble heart, might find a contented home here. Next comes the James, called in earlier and better days, the Powhatan—which, with the York, makes what is called, simply by the way of pre-eminence, *the* Peninsula. It was the theatre of the earliest civilization of the Old Dominion, and the seat of its first metropolis. It extends from the bay upward some 70 or 80 miles—its upper portion bounded by the Pamaunkee and Chickahominy. This peninsula also abounds with game. The deer have returned, verifying Horace—*Ferisque ursus occupabitur solum.*

South of the James and near its mouth are two tributaries—Elizabeth River, and Nansemond—having their sources in the Dismal Swamp. This whole region is well adapted for sporting adventure.

Next we have the Chowan and its tributaries—the Blackwater, Nottaway, and Meherin—and then the Roanoke, with its tributaries—the Staunton and the Dan, which rise in the Allegheny Mountains.

Every portion of Virginia is easily reached by steamboat or rail from Norfolk, or Baltimore, or Washington.

The Atlantic, Mississippi, and Ohio Railroad runs from Norfolk, 408 miles to Bristol, Tennessee—passing Suffolk, in Nansemond, near the Dismal Swamp, through Isle of Wight, Sussex and Surrey Counties (where deer and other game are almost as abundant as when the Indians ruled the land), by Petersburg, Burkesville, and Lynchburg, at each of which places it is crossed by railroads going North and South. The Sea-Board and Roanoke Railroad also runs from Norfolk through Nansemond and Southampton Counties, to Weldon, N. C., crossing the Blackwater, Nottoway, and Meherin—the tributaries of the Chowan. This railroad is an extension of the daily line of steamboats from Baltimore to Norfolk. A line of fine steamers also ply between Norfolk and Richmond, stopping at the various landings on the River. York River and its tributaries—the Mattaponi and the Pamaunkee—are accessible from Richmond and Baltimore by the York River Railroad, and steamers from West Point to Baltimore. All the landings on the Rappahannock are reached by steamers, which run twice a week between Baltimore and Fredericksburg. Every portion of the Potomac below Washington is accessible by steamers from that city, or Baltimore, or Norfolk. A line of railroad (the Richmond, Fredericksburg, and Potomac) extends from Quantico on the Potomac (accessible by steamer or railroad from Washington), due south along the head of tide-water by Fredericksburg, Richmond, and Petersburg, to Weldon, N. C. The Washington, Virginia Midland, and Great Southern Railroad, runs from Washington by Manassas (where it connects with the Manassas Gap Railroad leading to Front Royal and Shenandoah Valley), by Gordonsville, Charlottesville (where it connects with the Chesapeake and Ohio Railroad,) by Lynchburg (where it connects with the Atlantic, Mississippi, and Ohio Railroad), to Danville (where it connects with the Air-Line to Atlanta).

The great Shenandoah Valley may be reached by rail from Manassas, or from Washington and Baltimore, by Harper's Ferry, by Baltimore and Ohio Railroad, where it connects with the Valley Road, extending to Staunton, where connection is made with the Chesapeake and Ohio Railroad. On either side of this Valley Road, at distances varying from 5 to 40 miles, is found a great variety of game; deer, ruffed grouse (there called pheasants), bears, wild turkeys, etc. Most of the mountain streams have speckled trout—*Salmo fontinalis*—the more abundant and larger, the deeper you advance into the mountains, and the further from civilization. Perhaps the best trout fishing on the continent may be found in the head-waters of that river in Pendleton, Grant, and Archer Counties, West Virginia, and in the head-waters of the Greenbrier, in Bath and Highland, Va., and Pocahontas, W. Va., and in the Garsley River, in Nicholas and Webster Counties, W. Va. The Cheat River waters may be reached in 40 miles from the Valley Railroad, and the others from the Chesapeake and Ohio Railroad in less than 30 miles.

The Chesapeake and Ohio Railroad runs from Richmond to Huntingdon (423 miles), passing Charlottesville, Staunton, the famous White Sulphur Springs in Greenbrier, the Great Falls of the Kanawha, etc. After passing the Blue Ridge, this line supplies the greatest abundance and variety of game and the widest field for adventure of any district in the State. Deer, bear, ruffed grouse, turkeys, and trout are more abundant and accessible than elsewhere; it presents a magnificent field for camping parties.

The Richmond and Danville Railroad extends 140 miles to Danville, and forms a part of the Piedmont Air-line to Atlanta. It traverses Middle Virginia, where the game mainly consists of quail, hares, squirrels and wild turkeys, and where the waters contain very few fish, dams and seines being fatal to them. Above Danville, on the Dan River, the case is different. There the game becomes more abundant, and the mountain streams have many trout.

LEGITIMATE SPORTING LITERATURE.

THE lack of a legitimate sporting literature is becoming every year more and more apparent. When I say literature I do not refer to the sterling periodicals that grace the calling they represent, for it is an acknowledged fact that never before in the history of our country was each branch of that expansive field nominally quoted "sporting," so well represented; every part has its organ, and so ably and exclusively are they managed, that the lover of field sports can read his favorite journal, and find it devoted entirely to his pet branch, and his sensitive eye never distressed by the annals of anything out of his particular line.

We who shoot and fish, who delight in out of door exercise, who love nature in all her varied moods and forms, who delight in the protection of God's creatures, who have in us that right spirit that sees in the pursuit and capture of these creatures at the proper time, something more than the wherewithal to fill a hungry stomach, that sees in a gorgeous sunset, something more than natures simple promise of a fair day to-morrow. In a word, we who are not only quick at the trigger and deft at the reel, but in a certain sense artists and poets (for I believe the true sportsman is by nature something of an artist and poet) claim the name of "Field Sports" for our particular branch, and what we lack is books combining instruction and pleasure, pleasant narratives of personal experience in the field, seen through eyes that make a study of the reading of nature's open page. Where are the Frank Forester's the J. Cypress, Jr's. the Col. Hawkers and Charles E. Whiteheads, of to-day? We have plenty of treatises on the habits and haunts of game, on the breaking and rearing of dogs, on Ornithology, Taxidermy and Natural History, on the science of shooting with gun and rifle, but what have we beside? What have we left to please the eager sportsman when nature is wrapped in her winter mantle, when the gun is carefully oiled and laid away, the dogs warmly kennelled and nothing left but the pleasant thoughts of the happy field days past, and the blissful future. O so far distant.

What shall I read to night? FOREST AND STREAM is covered from title page to outside of cover, even the cuts of those enterprising advertisers who try to show in some small way the stock they deal in, by the open breech-loader are scanned and the reliability and soundness of the wares they represent mentally discussed. Let me look over my library again, the spirit moves and I must read something to remind me of the field. There they are! how natural they look, Frank Forester's "Field Sports," and "Sporting Scenes and Characters," "Porter's Edition of Hawker," "Fire Island Ana," by J. Cypress, Jr., "Camp Fires of the Everglades," by Chas. E. Whitehead, and Headley's "Adirondack or Life in the Woods." But these I know by heart. There are none of them younger than twenty years. Within ten years I have found but two books that smacked at all of the real thing so vividly portrayed by those old champions of a past generation, viz. Murray's "Adirondacks," and Prime's "I go a fishing," and neither of these gentlemen demeaned their cloth, when they added to the meagre store of real legitimate sporting literature.

The writer of to-day seems to aim at instruction entirely, and we are told over and over again what we were told forty years ago, and it is a fact that even when the modern sportsman wants an instructive work, relative to some important part of the shooter's or fisher's category, and asks advice from some reliable journal or sporting friend, as to what it had better be; does he wish to post himself on the training and management of dogs? he is told, Get "Dinks, Hutchinson and Mahew." Does he wish to become familiar with American game, its haunts and habits? he is told, get Forester's "Field Sports." Be he young, a mere novice in the handling of firearms, and desires to become a wing shot? there is nothing that can be recommended to him so honestly and unhesitatingly as Forester's "Manual for Young Sportsmen." And these are all old works, which since the introduction of the breech-loader and other devices unknown when they were written, might be greatly improved, but sad to say, they are not, and we cling to them, for we love them, and are unwilling to allow them to be supplanted in our affections by the indifferent matter these latter days produce.

There is one line of sporting literature that to-day is simply perfect. I refer to the books of sportsmen's routes that are now so numerous. The woods of Maine, the savannahs of Florida, the prairies of the west, the choice points on the Pacific slope, the streams and woods of Canada and the northern provinces, are all familiar to us through the medium of the guide book, and with means and leisure at our disposal we cannot go amiss. Ah! but we only need these when we have made up our minds to take our shooting or fishing vacation, and are undecided where to go. And we only need the instructive works when we get a new dog or gun, or rod, or reel, or some specimen, the genus of which is doubtful in our minds. We have neither time nor inclination to make Natural History and other field studies a life work. We want something that when sitting by the cheerful fire, pleasant memories of the chase with all its retinue of accident and incident, come stealing o'er our minds, and we become in our pleasant homes, almost homesick for that which now

is past, the truthful well written account of "moving accident by flood and field," something that will soothe and interest. It must be pure in style, choice in diction and so truthful in delineation, as to carry the reader there. I love to read a book in which when the sea is mentioned, you can almost smell the salt dank air, when a prairie is mentioned you can in your minds eye see the long level stretch of waving grass and nodding wild flowers; when a dinner is mentioned, the dinner-wrath, the green wood tree and the *menu* of the hunter's feast spread out before you, you can almost taste it, (this last requires great skill on the part of the writer and a vivid imagination on the part of the reader).

Let us hope that books of the kind to interest sportsmen in a pleasant kindly way will become more numerous than they are at present, that some of the talent which crops out in our sporting journals in short sketches may be induced to expand itself into volumes carrying out the experiences there so meagerly portrayed, and becoming a delight to the followers of woodcraft.

There are plenty of men who could do this thing and do it well, men of leisure and means, men whose field of action takes in the whole broad land, men of education and culture, whose name affixed to a book as author would be a sufficient guarrantee of merit and truthfulness and insure a sufficient sale among the fraternity to make it a success financially. However, among the class mentioned above, philanthropic motives should be the incentive, rather than love of gain, to think that the hearts of the brethren had been warmed, that the fireside had been made doubly cheerful, that an aching void (between fall shooting and spring fishing) had been filled, should amply compensate (after paying expenses) for whatever of brain work the author had expended. Let us have a legitimate sporting literature. H. W. De L.

GAME PROTECTION.

THE EARLIEST AMERICAN FISHERY LAWS.

THROUGH the kindness of his excellency, Gen. Lefroy, Governor of the Islands of Bermuda, our correspondent, Prof. G. Brown Goode, of the Smithsonian Institute, at Washington, who is now sojourning on the Islands, has been enabled to send us for publication copies of two of the laws enacted at the General Assizes of these islands during the seventeenth century. We believe them to antedate by many years any similar laws passed by any of the American colonies. Their antiquity, as well as the careful forethought of their proposers, entitles them to the attention of those who are interested in the subject of protective legislation.

The earliest was passed in 1627, two hundred and fifty years ago, fifteen years after the colonization of the Bermudas and about nine years after the establishment of the General Assizes. It aims at the protection of a small fish of the herring family, the pilchard (*Harengula macrophthlama*), to this day abundant in Bermudean waters. "Fry" is the name now applied to small fish, especially to the species of *Atherina* and *Engraulis* common in the harbors:

AN ACT AGAINST THE DRAWING OF PILCHARDS AND FFRYE TO MAKE OYLE.

Whereas it hath bene and still is a vsuall Custome of the Inhabitants of thcise Islands to hale and drawe pilchards in seuerall bayes and places where they doe frequent, more for the benefitt of the oyle than present vse of fishing, to the generall losse of the same Inhabitants, not only by reason of the distroying of very much frye but also to the greate losse and priudice of the said Inhabitants by chasing away other greate fishe from the shoare, weh liue vpon the said frye. And further doth hereby cause the said Pilchards and other small fish to be so shie that there is great scarcelty of Bayte for necessary fishing, wch beeing considered by this worthye and graue assemblie It is enacted by the power and authoritye of the same That from henceforth noe manner of pson whatsoeuer do hale or drawe any pilchards or other frye or small fishe (vnless for baite or food) out of any the bayes or other places belonging to these Islands as aforesaid And the rather for that it is a greate relicfe being taken only for baite to bring in sea fishe and otherwise a greate losse, especially in tyme of scarcelye of corne And it is further enacted by the power and authority aforesaid, that noe man of what quality so euer shall hale or drawe in any bay or about any Island with any long netts any manner of breames, to the distruccon and fraying (*sic*) of the greate fish from shoare, but only wth netts of Tenn fathom long at the most in forfeiture of the said netts soe vsed to be sould, and converted to genrall vses of the plantacon

Acts of Assembly, 1627.

At a later period the length of fry nets was restricted, I am told by General Lefroy, to two fathoms. It would seem as this measure must have almost put an end to the capture of small fish.

The other law, fifty years later, has for its apparent object the protection of the porgies (probably *Sparus calamus* and *Sparus orbitarius*) during the spawning season.

EXTRACT FROM THE WORDS OF THE ASSIZES HELD AT ST. GEORGES, DECEMBER, 1676. (vii., p. 6).

"Upon the presentment of the Grand Enquest presenting the euill practise of seuerall Inhabitants of these Islands, who at the season of ye yeare when the white bone Porgayes soules they ketch them through lucre of gaine, and kill them to dry for sayle to the priudice of ye whole Island, *Ordered thereupon* That when the white bone Porgayes soulls or are found in or about the easternost parts of these Islands in the month of Aprill and May yearly and every yeare that all manner of pson or psons forbeare ketching or killing, of any white bone Porgayes in the same time aforementioned more then is for their families use vpon ye forfeiture of five shillings for euery Porgaye so ketcht, or kild to dry, the Informer to haue one moiety and ye other moiety to be for Publique uses, ye same to be published in ye Governor's proclamation."

Prof. Goode says that he is not aware that any laws for the regulation of the fisheries are now in force in the colony of Bermuda.

CONNECTICUT.—The Connecticut Legislature on the 13th passed a new game law. It prohibits the shooting of woodcock or ruffed grouse between January 1st and October 1st, and makes the close season for quail for three years. The fine for violation is to be $25 for each bird.

CONNECTICUT.—*West Meriden, March* 16th.—The Connecticut River is very low for the season, and as no extensive freshet is anticipated, the meadows will be in better shape than usual for the birds, which will make glad the hearts of our snipe hunters, who love to roam the river meadows in quest of their favorite bird.

No summer woodcock shooting in Connecticut this year, for the Legislature has just passed a bill, "providiug that the close season for woodcock and grouse shall be from the 1st of January until the 1st of October." In regard to quail, the lower house has passed an amendment "providing, that quail shall not be shot for the next three years." It now remains for the Senate to act on the amendment. G.

INDIANA.—A new game law has passed both houses of the Legislature in Indiana, of which the following is a brief abstract:

SEC. 1.—The killing of deer in any manner is prohibited between January 1st and October 1st, under a penalty of $10.

SEC. 2.—Prohibits the killing of quails or ruffed grouse between January 1st and November 1st. Penalty, $2 for each bird.

SEC. 3.—Makes a close season for prairie chickens between February 1st and October 1st, and makes trespass upon the grounds of another without permission a misdemeanor, and punishable by a fine of not less than $5, or more than $25.

SEC. 4.—Protects insectivorous birds.

SEC. 5—Makes a close season for woodcock between January 1st and July 1st and for ducks between April 15th and September 1st.

SEC. 6—Refers to transportation of game out of season.

NEW YORK.—A committee of citizens residing near Lake George has engaged H. A. Howard Esq., of Glen's Falls, as counsel in the case of any or all violations of the laws by persons illegally taking fish from the waters of the lake. Citizens to whom knowledge of such violations may come are requested to report them to said counsel.

PENNSYLVANIA.—By a letter from a valued correspondent, the Secretary of the Greenville Sportsman's Club, we learn that fifteen sportsman's clubs have already joined the State Association, and that many others are likely to affiliate soon.

Ex. Governor William Bigler, of Clearfield County, Pa., has been elected President of the Sportsman's Club of that County.

MASSACHUSETTS.—We are indebted to several correspondents for copies of the new game law of Massachusetts which has passed the Legislature, and which is the result of the efforts of the Committee of the State Sportman's Association. Our space only permits us to give a brief abstract:

SEC. 1.—Makes a close season for woodcock and ruffed grouse from January 1st to September 1st, and for quail from January 1st to November 1st. The penalty for having in possession is $25.

SEC. 2.—Protects wood ducks, summer ducks, black ducks, and teal, between April 15th and Sept. 1st. Penalty, $25.

SEC. 3.—Makes a close season for upland plover from January 1st to July 15th. Penalty $10.

SEC. 4.—Protects insectivorous birds.

SEC. 5.—Prohibits the killing of any game bird except wild pigeon by means of traps, snares, nets, or springs, and also the use of batteries, swivel or point guns, torch or jack lights, in wild fowl or brook bird shooting.

SEC. 6.—Names a close season for deer until 1880, and then after between December 1st and October 1st; and for gray squirrels, hares, and rabbits between March 1st and October 1st.

SEC. 7.—Prohibits the killing of prairie chickens or pumated grouse.

The remaining sections refer to penalties, forfeitures, etc.

NOVA SCOTIA.—A new Game Bill has been presented in the House of Assembly of Nova Scotia, of which the following is a synopsis: "After this law comes into operation it will be lawful to kill moose and cariboo in the months of October, November, and December. Not more than three moose and five cariboo can be killed in one season by any person or number of persons forming a hunting party. Hunting with dogs, setting of traps, pits or snares, are absolutely prohibited, under severe penalties. Beaver are protected from the first of April until the first of November." Another section of the law provides for the issuing of game licenses at a charge of twenty dollars each, to all persons residing out of Nova Scotia. With regard to this enactment, we are inclined to think that the charge of twenty dollars for a game license is exorbitant, and the effect will be to keep out of the province a much larger sum of money than would be realized from all the moose or cariboo killed by residents. It is very true, as one of our Halifax contemporaries states, that the game belongs to the people of Nova Scotia, who pay for its protection. But the question of property being admitted another arises, and that is, how can that property be disposed of to the best advantage. It is an undisputed fact that sportsmen, particularly those who would go from the United States to the Province of Nova Scotia, spend a great deal of money in their excursions, and the amount they would leave behind them would be of very considerable importance. The law restricts them to a certain number of animals to be killed, and this, with the addition of an obnoxious tax of the amount proposed, would effectually keep them at home, and many people in Nova Scotia may revel to their heart's content in a diet of moose or cariboo meat—but unaccompanied by those luxuries or creature comforts which would have fallen to them had they been visited by Yankee sportsmen.

—A Wisconsin correspondent reports that about 1,500 pounds of brook trout were caught on the Brule River, thirty miles from Superior City, during December and January—of course against the law. These despoilers find a market and encouragement from the hotel and eating houses in St. Paul, Minnesota. Hundreds of pounds spoil before they could be brought in.

—At a stockholder's meeting of the Blooming Grove Park Association, held at the Park, in Pike County, Pa., March 13th, the following named Board of Directors was unanimously elected for the year ending March, 1878:

Genio C. Scott, Dudley Field, George S. Greene, Jr., E. R. Wilbur, George H. Glenney, Sanders O. Bruce, John Avery, F. S. Giles, A. H. Wellington, Chas. Hallock, Joseph Dore; Inspectors of Election, Robert Edmiston, and William Hickson.

HAMBURG, Penna., March 15th, 1877.

EDITOR FOREST AND STREAM:—

Considering the severity of the past winter, Berks County has still a goodly number of partridges within its precincts. Thanks to the farmers for their kind heartedness, in providing for so many of the poor birds. One lady caught nineteen one morning, which, added to a neighbor's flock, swelled the number to fifty-seven. The birds are becoming quite tame comparatively, and now, having once more full freedom, are loth to leave the premises of those who provided for them so long; in fact, seldom leaving the houses for a great length of time, and always ready for the "crumbs" when the poultry receives their rations. Partridges *are*, to a certain degree, protected by our game laws; but they are far from enjoying perfect immunity. Since the disappearance of the snow-drifts, the dead bodies of a large number of them have been found.

Our veteran trapper, "Fritz"—Horlocher—told your correspondent that he has four wild pigeons (decoys) in readiness for expected flights. That the English sparrows have either been starved or frozen, is a matter which has engaged attention, for their number has been fearfully diminished, through some cause or another, in this locality.

PERO NIXON.

OUR WASHINGTON LETTER.

(FROM OUR OWN CORRESPONDENT.)

PERCH FISHING ON THE UPPER POTOMAC—PAYNE'S EDDY AND THE LITTLE FALLS—BAIT AND TACKLE FOR PERCH—COMMERCIAL FISHERIES OF THE POTOMAC—WILD DUCKS, ETC., ETC.

WASHINGTON, D. C., March 16, 1877.

THE citizens of Washington who are inclined to the pleasures of shooting and fishing, are probably favored with as great variety of these sports as those of any other section of the country. There are not more than three months in the year when the followers of these sensible and health giving recreations cannot enjoy themselves, and even during that period, if the river is not closed with ice, those fond of aquatic shooting have the Potomac, with its millions of swans, geese, and ducks, where there is no end to such sport. Our fishing season opens generally about the first of April, with the magnificent white perch fishing in the neighborhood of the Little Falls and above Georgetown. The perch, with the herring and shad, ascend the river to spawn, and remain in this locality two or three weeks before returning to salt water. During the season it is a very common thing to take them weighing from three-quarters of a pound to a pound and a quarter each, and measuring from six to twelve inches in length, and when of this size they make a delightful pan fish. But before speaking of the habits of the perch, a brief description of their favorite haunts will not be out of place. Their spawning grounds extend all the way from Ead's Mill to the foot of the Little Falls, a distance of about a mile. The river between these points varies in width from seventy-five to one hundred and fifty yards, and in depth from four to fifty feet. The bottom is rocky, and at low tide numerous rocks are visible above the surface of the water. The shores on both sides are almost a solid mass of rock, and many fine perch are taken at high tide from the eddies formed by the rapid current behind some of the larger rocks.

Payne's Eddy, the largest and most notable one on the river, has an extensive reputation. It is located just at the foot of the Little Falls, and is an excellent fishing place, not only for perch, but for bock, or striped bass, and black bass in season, while the wild scenery surrounding it adds to its attractiveness. On the Virginia side, towering above the stream, is an immense cliff, fifty feet high, forming a bulwark of solid rock for the turbulent waters, which at this point rush down a narrow gulch for a distance of a quarter of a mile, with a current at the rate of ten miles an hour. Immediately above the Falls the Potomac is nearly half a mile in width, very shallow, and filled with rocks. At the Falls it suddenly narrows, and forms a cascade ten or twelve feet high. I will not attempt in this brief letter to give a complete history of Payne's Eddy, which has heretofore been noticed in FOREST AND STREAM, but a few weeks ago. I believe some of its ancient traditions were graphically told in rhyme by Mr. Shoemaker, of Georgetown. For more than half a century did Joe Payne capture the members of the finny tribe at this place. It was here that Daniel Webster, General Gibson, Judge Bibb, and many other prominent men of our own country, as well as diplomats residing at the seat of government, were always taken by old Joe, and many were the anecdotes he had of the fishing excursions of these distinguished persons. The legend of the phantom drummer of the Little Falls is already familiar to your readers, so I will not dwell on the history or traditions of the Falls and Eddy, but say something of the fish therein. The angler to be successful must have that knowledge of the habits and feeding time of the perch, which is essential in this, as well as all other sports, to insure success. Tide water of the Potomac extends as far up as the foot of the Little Falls, covering the noted Eddy, where the tide has a rise and fall of about three feet. The angler must always avail himself of the tide to have good fishing, as perch begin to bite about an hour before high tide, and continue to take the bait lively until an hour or more after the ebb tide has set in. Small perch will bite at most any stage of the tide, but high water is always best for the large ones. No other bait is required than the ordinary angling worm, and the bunching of three or four on a hook to make an attractive appearance generally entices the best fish. I have frequently caught fine perch with live minnow, but believe the worm to be equally as good bait.

A few hundred yards below the Little Falls is the chain bridge—or rather, what is known as the chain bridge, but in truth, it is a handsome iron truss bridge, built on stone piers, fifty feet above the surface of the river, at a cost of more than $100,000. Many years years ago, I believe, there was a bridge suspended by chains over the Potomac at this point, but it was long ago washed away by the freshets, and two or three

old wooden structures met the same fate. Below the bridge, as far down as Ead's Mill, there are many good fishing places, the favorite ones being in the eddies formed behind rocks, where the water is ten or fifteen feet deep. Sometimes when the river is very high there is a heavy current above the mill, and it is often a difficult matter to take a boat up as far as Payne's Eddy, or even to the chain bridge, but an expert oarsman can most always ascend the stream, although the rapid current will make his progress rather slow. Many start out from Georgetown, where comfortable boats can be procured, and get along very well as far as the Mill, where they encounter the current, and soon abandon any further attempt to go up; consequently, they lose the best fishing.

The ascent of the rapids, however, has its attending dangers, and several times boats have been capsized there, or swept upon the rocks by the swift current, and one or more of the occupants drowned. Great caution, as well as skill, is required to pass the dangerous places, but the boatmen in the neighborhood, who make their living by fishing, have no trouble in sculling their heavy bateaux to any point they may desire. The dipping of shad and herring in the neighborhood of the Little Falls, during the spawning season, affords a living to many of the country people residing in that neighborhood. They are equipped with a circular net attached to an iron rim of about four feet diameter, this is fastened to a stout pole twelve or fifteen feet in length, and the fish are thus dipped up. A good many pursue their avocation from the rocks on the Virginia shore, and others have boats large enough for two persons to dip from. The most successful dipping is at night, and very often the fishermen capture many shad and herring during a single night. Rock, black bass, and perch are also frequently taken in these nets. The dipping business is a dangerous one, and it very often happens that the dipper, perched upon some narrow ledge of rock, is over-balanced by his heavy net, and tumbles headlong into the stream. They are generally hardy men and expert swimmers, and therefore recover terra firma, though not without the loss of their net.

Many persons, in fishing for perch, do so from the rocks along the river bank instead of from a boat. At high tide they often have good sport, but never take as many large fish as the more experienced fishermen, who have their boats anchored over the deep holes, and above eddies, where they take out the larger ones, oftentimes as fast as they can bait their hooks. On many occasions two or three of us have captured over two hundred perch in less than three hours by fishing from a boat.

The tackle used for catching perch is very light and easily arranged. I always use a fourteen foot rod, braided linen line, and reel; the latter is a matter of convenience. The perch is not a game fish, and therefore the reel is not necessary to give him line, as in fishing for rock, bass, and other game fish. Perch bite rapidly and swallow the hook, but offer no resistance, and are easily taken from the water. Two or three small hooks (Limerick, Aberdeen, or Kirby) are attached to the line above the sinker, and the best fish are caught near the bottom.

After spawning the perch start down the river early in May, and at this time very fine ones are caught between Georgetown and Analostan Island, where a portion of the river has a rocky bottom, but as the Potomac at this point is much wider than above, in the neighborhood of the Little Falls, the fish have a larger body of water in which to distribute themselves, and therefore do not bite as rapidly. They are caught here in water from fifteen to twenty feet deep. Old fishermen declare that it is the favorite spawning ground of the sturgeon, and that the perch stop there, on their return to salt water, to feed upon the sturgeon spawn.

As the perch season ends, that for rock, or striped bass, opens, and continues two or three weeks. These fish also ascend the river to spawn, and they are taken at Payne's Eddy and many other localities. One of the favorite haunts for them is at the "Riffles," just opposite to Ead's mill, and the bait used is fresh herring cut in strips, or live minnow. Black bass are also captured near the chain bridge and at the foot of the Little Falls, but the favorite places for the latter fish are above tide-water. I will have something more to say about these game and ravenous beauties in a future letter.

The shad and herring fisheries of the lower Potomac, which have formerly given employment to a large number of persons in the spring, and, until within a few years past, supplied this section of the country with those fish, have been gradually failing, and from present indications there will be very little effort made by our seine haulers this season in prosecuting that business on the shores of the Potomac. From the experience of the past few years they are disheartened. Some of the most extensive fishermen are desirous of selling out their seines, traps, boats, and other property at less than cost, if possible to find purchasers. Hundreds of laboring men, who have heretofore been employed at the fishing shores, are disappointed, and are seeking other employment. Quite a number of landings have been abandoned, and will not be worked at all this season.

Wild ducks were beginning to re-appear in large numbers on the waters of the Potomac and Chesapeake, until the recent cold snap, which seems to have retarded their flight in this direction. A heavy gale a few nights ago played sad havoc among the ducking blinds down the river, but repairs are being made, and it is thought the ducks will be plentiful in a week or two.

In a recent letter I referred to the eagles and owls caged in Franklin Square, in this city. Col. Casey, the new commissioner of public buildings and grounds, does not favor the idea of keeping them caged. It costs about $40 per month to feed them, and of late, had it not been for the persons residing near the Park who sent food to the birds, they would have been starved to death, there being no money to feed them. Col. Casey has offered to give them to Prof. Henry, of the Smithsonian Institute. If he does not want them, and no one else asks for them, Col. Casey intends that they shall be set free to roam where they desire. They must be disposed of in some way this week.

Rifle.

SUB-CALIBRE RIFLES.

THE question of fitting a rifle-barrel within the barrel of a shot-gun, and thereby converting the latter into a weapon which could be used for large game, is a question which is at present being very generally agitated. For ourselves, we think that while the scheme is perfectly practicable as far as the mechanism is concerned, it would yet make a nondescript piece, that would possess but very little value. For instance, if the gun was wanted for long trips and mixed shooting, where would the rifle barrel be carried? Under the barrels? Then why not have it made a permanent fixture, as in the Baker gun. It certainly could not be carried in the barrels, if small game was to be killed. As a rule, but few combinations of this kind prove to have sufficient practicability to bring them into general use, although there is no question but that, at the present time, there is a large demand for something in the shape of a combined rifle and shot-gun. We have had a number of letters on the subject, extracts from two of which are given below, both from old gentlemen. One writes:

"Although my rifle-shooting days are evidently about passed away, I take a lively interest in your rifle columns. I was particularly interested in the brief article of 'B. L.' last week, under the above caption.

"Just fourteen years ago I took a Sharp's army carbine, and cut out the grooves, making thereby an excellent small-box, breech-loading shot-gun. After a long series of experiments I succeeded in making a compound powder and shot cartridge, with which in this small box gun I made the best patterns I have ever seen.

"After transforming the army carbine into a shot-gun, I made a rifle barrel that would slip into the short barrel from the breech. Of course the rifle calibre was very small, taking I think about 250 round bullets to weigh a pound. With this diminutive gun I killed more small game than with any other gun I ever owned, and I have owned and used several valuable rifles and good shot-guns, and have been accounted a successful hunter by all my acquaintances. I took this gun to the Sharp's Rifle Works, then at Hartford, and urged the company to manufacture double guns of 10s calibre, and fit therein rifle barrels of any calibre that might be required. Some members of the company were decidedly favorable toward the scheme, but the president opposed it, and nothing further was done.

"For my hunting I would much prefer such a gun, with one rifle barrel of large calibre and the other small, to any weapon yet in use. "MACAUTAR."

A Canadian correspondent from Toronto writes, that he has tried having rifle barrels made to fit inside of his shot-gun, but that it did not work. He says:

"The two barrels did not shoot alike from the same sight, and at 100 yards, I could not hit aboard two feet square with both barrels; with one rifle barrel in one shot-barrel it did very fairly. I have had three double rifles, and not one of them shot perfect with the same sight. I am surprised, however, that some of the American rifle manufacturers do not make double rifles. With their perfect machinery, and their true way of working, they could make a double rifle shoot correctly at the first time of asking. I am very fond of deer hunting, and have taken 14 days yearly at it for the last 25 years, and although I am now nearly 70, I get keener for it as I grow older. In my rifle the rifling is something like the Rigby plan, that is, not cut sharp, but running, so as to have no sharp corners. I then cut a bit off the muzzle for a bullet mould. These bullets I immerse in hot grease before using; the contraction of the lead just gives room for the grease and they go down easily. The only fault I find with this rifle is, that I cannot protect the caps from getting damp, and many a good shot I have lost from missing fire. A breech-loading double-rifle is the best for bush hunting; you never get more than two shots, and you don't require to take the rifle from the shoulder, and with your left eye shut you can see the deer through the right; but I don't approve of keeping both eyes open, as you can't look through the sight of a rifle with both eyes at the same time. I have had a rifle from every celebrated maker, and I have a 40 calibre of Sharp's now, which is the best shooting rifle I ever owned. I think at 40 rods I could kill 50 turkeys with 50 shots (if there was no wind).

"Very respectfully, "TORONTO."

THE INTERNATIONAL MATCH.—The following circular has been sent by the Amateur Rifle Club, of New York, to rifle clubs throughout the country:

DEAR SIR—An invitation has been received by this club, from the riflemen of Ireland to the riflemen of America, to shoot a match in June next, under similar conditions of those governing the Irish-American matches of 1875-6.

Will your society send one or more men to represent America in this contest? Each man selected, as one of the team, will be required to bear his own expenses. It is expected his club will provide for him to the extent of $500, gold.

Please lay this matter before your society, and communicate its answer before the 1st of April next, as it is necessary that this club should know by that time whether a representative team can be got together or not.

The Amateur Rifle Club earnestly desire the active co-operation of the rifle clubs of America in this matter.

C. B. MITCHELL,
G. S. SCHIEMBHORN, JR., } Committee.
E. H. SANFORD,

JOSEPH HOLLAND, Secretary.

CONLIN'S GALLERY.—We write our caption, but "Conlin's" is a thing of the past. The insatiable fire fiend has opened his rapacious jaws and swallowed the earnings of years. Wherefore, we call upon all good riflemen, and upon Mr. Conlin's numerous other friends, who, like ourselves, may be poor riflemen, but warm admirers, to respond to the call issued by the committee appointed for the purpose, for a Benefit Rifle Tournament, tendered to James S. Conlin, by his friends, patrons, and fellow riflemen, which opened at Zettler's Rifle Gallery, No. 207 Bowery, on Saturday, March 17th. The ticket are but 50 cents each, and the prizes, comprising gold and silver medals, to amount to over forty. If any of our readers are too bashful to shoot in public themselves, they can send their subscription tickets to us and we will shoot for them, guaranteeing in each instance that the scores will not be such as will bring their names into notoriety.

MILEY'S GALLERY.—A rifle match in the lying down position has been commenced at Miley's Brooklyn range. The following are the best scores made so far out of a possible 50, shooting at a Wimbledon target graduated to 120 feet: F. P. Pike, 45; Ransom Rathbone, of the American Team, 44; J. W. Wallis, 44; A. H. Anderson, 43; H. Stanton, 42; J. F. Burns, 42; Col. B. E. Valentine, 42; E. B. Castner, 40.

A match for members of the press commenced on Monday evening of last week. Several handsome prizes are offered for both matches.

RIFLE NOTES.

—The American Rod and Rifle Association of Jamaica, L. I., held their annual meeting and elected officers last week. The officers are as follows: President, George H. Creed; Vice-President, John Fleming; Treasurer, Charles J. Stewart; Secretary, Samuel S. Aymar; Executive Committee, John H. Sutphin, John M. Crane, Theodore Rogers, William S. Cogswell, James P. Darcy, Albert J. Watkinson and William S. Elmendorf. Their first match this season will take place in April.

The Irish Rifle Association seem to entertain considerable hope in the government for the changing of the laws in relation to the Volunteer Act, in order to allow their countrymen to be represented in the future competitions for the Queen's prize at Wimbledon, as the following letter of Major Leech's to the Editor of the Dublin *Times* will show:

DUBLIN, March 1, 1877.

SIR:—I beg to inform you that at a meeting of the council of our Association, held this day (March 1st), the subjoined resoultions were unanimously adopted:

"That the Council, although deeply interested in our proposal, which promises to extend in other parts of the British Empire, for the attainment of skill in rifle shooting, desire to leave the initiative in the hands of the government."

"That, in view of the impending discussion in Parliament of the proposal to extend to Ireland the provisions of the Volunteer Act, as now extended in England, a deputition be sent to London to ascertain what course the Government intend to adopt, and to urge them to make some concession, with a view to enable residents in Ireland to qualify to shoot in all volunteer competitions at Wimbledon."

R. B. LEECH.

MILEY'S GALLERY.—The following is a record of the best shooting made up to Monday, March 19th. This match commenced on the 12th of March and ends on the 15th of April—laying down position, distance 120 feet, Wimbledon target reduced in proportion, ten shots, possible 50:

Name.	Total.	Name.	Total.
W. H. Dougherty	48	J. F. Burns	45
A. H. Anderson	46	R. Rathbone	45
John Kinkaid	46	H. Fisher	44
D. T. McQuillan	45	E. B. Castner	44
F. P. Pike	45	A. Dougherty, Jr.	42
J. W. Wallis	45

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, &c.

LOW-PRICED GUNS.

NEW YORK, March 13, 1877.

EDITOR FOREST AND STREAM.

As high and low-priced guns attract the attention of many of your correspondents, I send you my experience in the matter.

I used a stubb and twist Manton from 1832 to 1846, 12-bore, that cost me sixty pounds sterling. From 46 to 52 I used a Westley Richards, 10-bore, that cost a little more. From 52 to 68 I used an Ely, 10-bore, that cost thirty-five dollars. From 68 I have used a breech-loader, 10-bore, laminated steel, made by Whitney, of New Haven, that cost forty dollars.

The best of the muzzle loaders was the Ely—which was rather well known at John Maxsons, or Perrines, on Barnegat Beach, for several winters. The next was the Manton that was in service twelve years, in Buenos Ayres, and Patagonia, one day or more each week, and is there now.

Eli Whitney, about eight years ago, began making breech-loading sporting guns by machinery. He made 1,200, which were sold to the trade at about $30, and then turned the machinery to make his military rifle. A better gun to shoot, in every respect, I never saw, and Prof. Baird, of the Smithsonian, fitted out eight or ten naturalist's expeditions with them, and told me that he always had most satisfactory reports of them.

Remington low-priced guns are made by machinery, and each gun is more perfect than can be made by hand.

When brass shells were first made in this country, I was connected with a cartridge manufactory, and spent some weeks in testing different calibres. I tested nearly one hundred guns that were by the best English makers, all high-priced, 50 pound and upwards, of 10 and 12-bore, and found but eleven guns that had both barrels exactly alike. They were made by hand, and a brass shell would fit tight in one barrel, and be very loose in the other. They are more careful now, but this difference cannot exist in a machine-made gun.

I recently saw a bill for making one model rifle at Colt's, that was for $460, being hand-made, and it would not compare with one of Colt's Berdan, that they made by machinery, to fill a contract with the Russian Government, that cost $10 and let me add here, that Colt's Berdan Russian Rifle, cal. 42, is the best finished military rifle yet made.

The cost of making guns by machinery is so much less than by hand, and they are better made, that they must get profitable to make, with increased consumption. So far not much profit has been made.

I consider all cost of over $50 retail for a double-barrel shot-gun as superfluous—the same as a book for $1; or bound in Russia and extra gilt for $6. All the value over $50 is in ornament, hand finish, etc., which those that can afford it have a right to; for which heresy I hope you will pardon me, as I am a believer in the FOREST AND STREAM in all but high-priced guns.

The best military rifles cost $8.50 to make now, and if Remington or other good makers sell 10,000 a year, they can wholesale a good, serviceable, reliable sporting gun at $18 to $20. C. D.

[Our correspondent *may* be right, but we hold to our original opinion, that a $50 gun cannot be made with the same

serviceable and lasting barrels as are put on higher-priced guns, whether they be of home or foreign make, to say nothing of the finer workmanship throughout, which prevents the gun from rattling after one or two season's use.—ED.]

CAPT. BOGARDUS LAST FEAT.—On Friday night last Capt. Bogardus accomplished the feat of breaking 1,000 glass balls in the remarkable time of one hour forty-two minutes and fifty seconds. As one entered the building the almost constant succession of reports was like file firing, and it seemed incredible that it could be produced by one man with one gun. Unfortunately, a stormy night prevented the captain from having the full house that otherwise would have greeted him. Those who stayed away missed a rare exhibition of skill and endurance. Still, the attendance was large, but in the immense Hippodrome a thousand or more persons are scarcely noticed. At the upper end of the arena a wooden screen had been erected and covered with white muslin. Some ten or fifteen yards in front the six traps were arranged, with strings leading to the shooter's stand, eighteen yards further in the rear. Capt. Bogardus used Dittmar powder and No. 8 shot, shooting 3¼ drachms measurement of black powder, of the former and 1¼ ozs. of the latter. Many of the balls were hit but not broken, which we think would not have been the case had the captain used Childs shot. He had set his task to be done in two hours and forty minutes, but it was evident after the first hundred balls that he would be even aside of that time. The first five hundred were shot at in 45 min. 50 sec., when an intermission of 18 minutes was taken, the second five hundred were shot at in just 43 min., and the 136 necessary to make up the misses occupied 15 minutes. When the shooting was over, time had been beaten 57 min. and 10 sec. He was 10 minutes in shooting at the first hundred, but the fifth hundred occupied only 8 min. 51 sec. As many as fourteen balls were marked in one minute. We trust that Capt. Bogardus will repeat his performance, when we would suggest to all who wish to see a wonderful exhibition to be present. Mr. Bergh was on hand, but did not interfere.

The Captain informs us that he will repeat his performance at Gilmore's Garden on Friday night, backing himself for $500 to break 100 *glass balls in* 100 *minutes*. After the performance he will back himself to break 100 balls while any person in the audience is breaking 80.

—The Kentucky State Sportsman's Association have engaged to give a tournament at their annual meeting at Lexington, on May 12, 14, 15, 16, 17, and 18, at the time of the great races. Prizes to the amount of $3,975 will be given, including a gold medal, for the championship of the South and Southwest, and a silver service set for the club championship of the same. The tournament will be open to the world, and among those certainly to be present is Abe Kleinman, who goes, so Mr. Martin writes us, with the expectation of meeting and matching Captain Bogardus.

VALUE OF THE COMPASS IN TRAVELING.—Col. Dodge, in his new book, "The Plains of the Great West," says:—

"The importance of having always a compass cannot be too strongly impressed on all who travel on the plains. "Old Plainsmen," and so called "scouts," or guides, who desire to be regarded as "Old Plainsmen," frequently profess a great contempt for a man who cannot travel without "one of them little boxes." With some this contempt is real, and comes from the entire ignorance of the nature and use of the instrument. Others who profess this contempt are actuated by interested motives. They desire to be employed as guides of scouting or hunting parties, and not unnaturally are very indignant at seeing an officer or civilian, with no guide but his "box," plunge unconcernedly into a country the details and difficulties of which it has taken them years to become acquainted with.

Besides this, old plainsmen and guides who ignore the compass, in my experience are not always to be relied on for close or direct traveling. They will lead a party into the wilderness and bring it back, but for my own part, and with ample opportunity to form an opinion, I would not give up "the box" for the best guide on the plains. Of course this is very different in mountainous regions, where the lines of possible travel are very few, and local knowledge almost absolutely necessary."

A PANTHER HUNT.—A friend sends us the following extract from a letter to him, describing a panther hunt near Wells, in Hamilton county, this State:—

I came across a panther track a short distance from my shanty recently. My brother was with me, and I proposed we should go after him in the morning, but Lysander said it would do no good—as we had no dog we could not catch him; but I told him we would hunt him, and if there was any deer we would find them, as he, the panther, was a better hunter than we were. So we started in the morning, soon after daylight, with our knapsack and hatchets. We started the panther in about an hour, and we pressed him as fast over the worst mountain you ever saw as possible. About noon we succeeded in running him in a cave in the mountain. I watched the place where the panther entered, and Lysander went in after him. Lysander, traveling about fifty feet or more through the rocks, found another place the brute had got out, and then we pursued him again, and at about one o'clock we had followed him so close he came down to the foot of the mountain, and run under a log that had fallen down by the side of a rock so close that the snow from the rocks and log was connected, and when I stepped on the rocks I stepped so close to the edge that the snow was broken down, and I saw the panther lying at my feet, perhaps two feet from where I stood, not more than that, and I commenced firing. The first shot went down through by his back; he then began to try to get up on the rock, and when he turned around I put another ball through his fore shoulder, and then he put his head almost against my feet, and then I put a ball through the center of it, and that ended his life. He was a large one, measuring eight feet from tip to tip. Thus ended one of the most exciting hunts I ever had. SILAS CALL.

CHAMOIS HUNTING.—At gray dawn the chamois hunter is on the alert, and by the aid of his clear-eyed Swiss guide and a good deerstalker's glass, he sweeps the rocky peaks and ledges within his ken. If he is lucky enough to spot the sentinel chamois perched on some pinnacle of rugged granite, the party separate in order to circumvent the flock—a proceeding which in nine cases out of ten ends in miserable discomfiture. Sometimes, however, the party above the chamois get a crack, at others those below. Even should the bullet take effect, not a bone of the quarry may ever be picked at the camp fire. Sometimes the death-struck chamois topples off the giddy ledge, and bounding from projecting crag to crag, as he falls downwards, eventually lodges in some inaccessible crevice, a mere pommelled mass of shapeless skin and bone. At other times the hunters find it impossible to get at the ridge upon which the chamois has fallen. Should the party, however, succeed in catching the old goat, great is the rejoicing and horn blowing, and many the nips of old cognac indulged in. The flesh of the chamois eats more like a goats than deer's meat, and from a gourmand's point of view is a dead failure. The wild, sterile and romantic scenery, the dead silence of the Alpine heights where the dangerous sport is pursued, and the extreme arduousness of the pursuit, all have charms for the true sportsman and lover of nature.—*British Mail.*

RARE SPORT IN LOUISIANA.

EDITOR FOREST AND STREAM:

We have had rare sport in ducking, and are now turning our attention to the snipe, whose "scaip-scaip" rarely fails to arouse the ambition to tramp through mud and mire, heedless of the depth of the numerous musk-rat holes our prairies afford. Deep and dangerous, too, are some of these abodes of prairie vermin, and to sink down suddenly into the cosy parlor of the alligator who, snugly ensconsed, dormant and oblivious to all transpiring in the wintry outer world, is a realization from which the writer beseeches exemption. Sometimes guns are lost, bags and all, in the struggles to regain firm footing.

We have *no game law;* an institution most earnestly needed. Turkey, partridge, deer, and all game indigenous to this locality, are slaughtered and trapped at all seasons, to the lasting shame of our legislators, irrespective of political persuasion. The sportsman is blessed, indeed, with the rare advantages our country affords. Within a radius of thirty miles of New Orleans game of great variety can be successfully bagged. Of course, our prairies do not afford us the engaging sport of grouse-shooting—concerning which, I have been delighted in the perusal of many accounts in your pleasing journal—nor do our Western friends know the keen flavor of our "papa-bottes." Altogether, our bags are different; so, too, do our grounds differ.

Our prairies are peculiar—mostly affected by the tides of the lakes—are covered with a tall, rank growth of reed and grass, ranging in height from three to six feet, and almost impenetrable. Throughout the prairies are found shell-banks, or islands, showing unmistakable indications that, at some remote period, this whole expanse of marshland must have been covered by the waters of the sea. We burn the grass in early fall to afford "snipe-burns," where they feed in great numbers, and along the edges of the bayous and lagoons we rather like the grass to grow, as it furnishes the best of blinds for concealment in ducking. In ducking, the prevailing custom is to hunt in the piroque; very cranky specimens of the ship-builder's craft to the inexperienced. To the experienced, the piroque is safe and comfortable as a Clyde steamer, and the writer remembers having frequently seen men so expert as to stand upon the gunwale and shoot or paddle without materially rocking the boat.

Among the most popular resorts within easy access are Miller's Bayou, Chef Menteur, Bayou des Allemandes, and Bayou Labranche. The first two-named are situated upon the Mobile R. R., the latter, respectively, upon Morgan's R. R. and Jackson R. R. At Miller's, the hunter or fisherman, as the case may be, finds a camp, so to speak, of three or four houses, situated upon a shell island of the prairie near the shore of Lake Catherine, and direct upon the bayou, where ample provision is furnished—such as piroque, decoys, a clean bunk, and plenty of duck, and fish, and coffee, and other consolation for the inner man, all for a moderate sum; and at an equally modest sum can be procured guides. These guides are experienced in manœuvering the piroque across the betimes angry waves of Lake Catherine, or through the intricate maze of a crooked, narrow bayou. Woe to him who, under "Tom's" care, fails to kill ducks at Seven Ponds, Bayous Bob, Pecan, or Cassenay, at Grand Point, or the Corridors, or snipe on Frederic Burn, or Ween's Island! Black, gray, mallard, canvas-back, teal, "fan-fan," "bec sec," "dos gres," and many varieties of duck, with names peculiar to the creole vocabulary, are found here in great numbers from November 1st to March 1st. Prior thereto and after large bags are not frequent. We have as jolly and open-hearted hunters as the land affords, and boast as fine shots, good guns and dogs. We have, too, as enthusiastic disciples of Isaac Walton as of "Forrester;" and here again, Miller's Bayou offers superior inducements—the possible catch including red-fish, sheeps-head, green trout, and striped bass. The green trout I conceive to be very much like your black bass. Am I right? Perhaps some of your readers might kindly venture enlightenment.

New Orleans, March 10, 1877. EARNEST HUNTER.

THE HERMIT OF MT. DESERT.—"Old Cling" is a character well known to the people of the western part of Mt. Desert Island. He seems more like a hermit than he does like a maniac, but some would probably call him the latter. He lives in a hut near the seashore made of brush and sea weed, which are packed between perpendicular stakes driven into the ground, and not much larger in appearance, than a large cock of hay. He lives principally on raw pork and molasses, but he eats raw clams in their season. When he leaves his hut, as he frequently does to get his pork and molasses, he carries with him a short piece of hard wood plank to sit on. He will not even sit in a chair without first placing this piece of plank upon it. He wears nothing on his feet even in the coldest weather, but a pair of old stockings, and these are seldom whole, especially in the region of the toes. Any one going near his hut soon after a light snow may see the prints made by his very large feet, and not unfrequently the marks of his toes. When he goes into a house, as he is sometimes oblige to do, he always stops the clock, if he is allowed to do so, for he can not bear the least noise, not even that made by an ordinary clock; and the crowing of a cock almost drives him mad. When he hears that dreadful sound he will place his hands over his ears and commence to cry "murder" at the top of his voice. He has been heard on such occasions for the distance of nearly a mile. He has another strange habit, which is steaming himself over a tub of hot water every morning. He earns enough money by making baskets and by repairing trinkets and tin-ware, to supply himself with his simple food, and is said to have quite a stock of bank bills which he keeps between the leaves of an old book. He came to the island in a boat a few years ago, but what his history is previous to his coming to the island is not generally known, and nothing can be drawn from him in regard to it.—*Maine Farmer.*

—A woman has made a heroine of herself in Marion, Ill. She is the wife of a bank cashier, and one night robbers entered her residence, tied her to her bed, and threatened to kill her if she did not tell them where the keys of the bank were kept. She screamed boldly, and the robbers fled, after cruelly beating her to make her keep silent.

The Kennel.

THE KENNEL REGISTER.—List of dogs whose pedigrees have been entered in the Kennel Register for the week ending March 20th:—

SETTERS.

Clip—Red; R. H. Gillespie.
Brag—Black and tan; H. B. Northcott.
Cora II—Red; Emett Smith.
Cale— do do
Bruce— do do
Cosette— do do
Range— do do
Ruby— do do
Aileen— do G. H. Tousey.
Dixie—Black, white, and tan; G. K. Harrison.
Page—Black, white, and tan; G. K. Harrison.
Lou — Red; C. P. Noland.
Buck— do do
May— do do
Ruby— do do
Punch—Red; C. P. Noland.
Chance—Black and tan; C. H. Hinkle.
Don—Orange and white; R. Valentine.
Sir Fred—Orange and white; H. P. Carlson.
Glenlloewk—Charles De Rouge.
Red Hugh—Red; John Fettler, Jr.
Hoxo—Orange and white; E. D. Hempbill.
Dash—Black and tan; R. Pancoast.

FOX HOUNDS.

Colon—Black and tan; G. A. Edmunds.
Judy—White and lemon; G. A. Edmunds.

THE NEW YORK BENCH SHOW.

From William Lincoln's letter, which we print below, it will be seen that the New York Bench Show is fairly under way:

WESTMINSTER KENNEL CLUB, March 20, 1877.

EDITOR FOREST AND STREAM.

In assuming the responsibility of superintending this show, I do so with the greatest confidence that the managers have only one object in view, viz.: The improvement of the various breeds of dogs. The judges will be chosen for their well-known capabilities and unbiased opinions, and those sending dogs may rely on having fair judgment, as far as the Committee are concerned. In all probability, a noted English judge will act as Advisory Judge, particularly with regard to non-sporting classes. The premium list is now ready for distribution; the prizes are valuable, and embrace nearly all breeds of dogs. All prizes given in gold, will be paid in "gold coin," before the show closes. In addition to the prizes offered by the Club, numerous and valuable special prizes have been promised, none of which will be of less value than about $50. When all are received, they will be published in a separate list. The non-sporting classes will receive a good share of the special prizes, and it may be expected that such a show of St. Bernard's, mastiffs, shepherd dogs, terriers, etc., will be collected together, as never has been seen before in America.

The place of holding the show (Gilmore's Garden) is, without doubt, the finest and best place in the world to hold such an exhibition; plenty of light and air, and enough room to hold and exhibit two thousand dogs if necessary. I have great pleasure in inviting all breeders to enter their dogs, as I am sure they will find everything done for the care and comfort of their dogs. Entries close the 25th of April. Prize Lists, etc., can be had by applying to me, at 17 Chatham Street, Box, 2,333.

Yours, truly, CHARLES LINCOLN, Superintendent.

We have received a copy of the Premium List, of which we give a brief abstract—all that our space will permit. The pamphlets, themselves, will be forwarded on application.

LIST OF PREMIUMS.

DIVISION 1.—SPORTING DOGS.

CHAMPION CLASSES.—For either native or imported dogs or bitches that have won first prize at any Bench Show in this country or abroad, the Centennial Bench Show at Philadelphia not included.

CLASS 1.—Champion English Setters.—For the best dog; prize valued at $50. For the best bitch, prize same value.

CLASS 2.—Champion Irish setters. Prizes as above.

CLASS 3.—Champion Gordon setters. Prizes as above.

CLASS 4.—Champion pointers. Prizes as above.

(Judges in this Class will be instructed not to discriminate with regard to weight.)

OPEN CLASSES.

CLASS 5.—Imported English setters, or their progeny of the first generation: For the best dog, $30; second best, $20. For the best bitch, $30; second best, $20. For the best dog puppy, under twelve months of age, $10. For the best bitch puppy, under twelve months of age, $10.

CLASS 6.—Native English setters. Prizes as in Class 5.

CLASS 7.—Imported red, or red and white Irish setters, or their progeny of the first generation. Prizes as in Class 5.

CLASS 8.—Native red, or red and white setters, either Irish or cross-breed. Prizes as in Class 5.

CLASS 9.—Black and tan, or black, white, and tan, Gordon setters, either native or imported. Prizes as in Class 5.

CLASS 10.—Pointers of fifty pounds weight or over. Prizes as in Class 5.

CLASS 11.—Pointers under fifty pounds weight.

CLASS 12.—Pointer puppies. For best pointer puppy, under twelve months of age, $10. For best bitch puppy, under twelve months of age, $10.

CLASS 13.—Chesapeake Bay dogs. For best dog, $20; second best, $10. For best bitch, $20; second best, $10.

CLASS 14.—Irish water spaniels. For best dog or bitch, $20; second, best, $10.

CLASS 15.—Retrieving spaniels other than pure Irish. Prizes as in Class 14.

CLASS 16.—Cocker spaniels. Prizes as in Class 14.

CLASS 17.—Field spaniels of any other breed. Prizes as in Class 14.

CLASS 18.—Fox hounds. For best couple (dogs or bitches), $20; second best, $10.

CLASS 19.—For best couple (dogs or bitches), $15; second best, $10.

CLASS 20.—Beagles. For best dog or bitch, $15; second best, $10.

CLASS 21.—Dachshunds. For best dog or bitch, $15; second best, $10.

CLASS 22.—Fox terriers. For best dog or bitch, $20; second best $10. For best puppy, dog or bitch, $10.

CLASS 23.—Greyhounds. For best dog or bitch, $15; second best, $10.

CLASS 24.—Staghounds. For best dog or bitch, $15, second best, $10.

CLASS 25.—Deer hounds. Prizes as in Class 24.

The non-sporting classes will be printed next week. The Special prizes will be particularly valuable. Up to date a number have been contributed. One class, which was omitted in the General Class, will be included in the Specials; that is, a class for native black and tan setters, either pure, or cross-bred with Irish, or English, or both. The prizes will be of the value of $30 for dogs and bitches, respectively.

PROFESSIONAL DOG STEALERS.

HOW PET ANIMALS MYSTERIOUSLY DISAPPEAR.

AN officer in the Chairmont Savings Bank, on Greenwich street, not far from Fulton street, in the course of a conversation, mentions facts corroborating the common impression that dog-stealing in New York is reduced to a science. He purchased from a gentleman, a high-blooded pup, which a day or two after suddenly disappeared from the bank. Calling a boy, who was well acquainted in that neighborhood, and directing that an advertisement should be put in one of the newspapers, the boy remarked, "I guess I can find that dog." Sure enough, the next day word came that the dog could be seen in the store of a dealer in animals, birds, &c., at no great distance. Accompanied by the original

owner of the lost dog, the bank officers went to the place in question, inquired the price of a game rooster, and finally stood before the cage of the little pet for which they were searching. Calling out "Cæsar!" the imprisoned animal seemed frantic with joy; the recognition was mutual. The store-keeper previously wanted $25 for the creature, and even now under suspicious circumstances, refused to surrender until threatened with difficulty. He at least demanded the return of seventy-five cents, which he said he paid to the man who brought him.

In another instance, a beautiful Maltese cat, which disappeared from a provision store in the Second Ward, was found under circumstances much the same. Again, when a stolen dog had been identified and recovered, the animal picked up strychnine in the street (reasonably assumed to have been placed in his way by an emissary of the professional thief) while on its way home, and died the next day. Again, the alleged receiver of stolen pets was heard on a certain occasion to inquire of one of his skirmishers, if he remembered a house on Madison avenue, where he sold a cat a few days before. "Well," he said, "you bring back that cat; I've got another customer." These statements, as above, received from various sources, suffice to account for singular disappearances for which no other explanation can be given. So, look out.

DOGS IN NEW YORK CITY.—We have not always been in accord with Mr. Bergh in his crusades, but in his present fight with the Common Council of this city, his efforts to have the recently passed ordinance regarding dogs so modified that they may be humanely dealt with, Mr. Bergh has our warmest sympathies. As the new law was first worded, any dog which might happen to run astray, or escape temporarily from its master, was liable to be seized by paid ruffians, or their sattelites, who, under the inducement of the reward offered by the city, would not be particular as to the means by which the dogs would be brought within their clutches. The poor beasts would then be carried to some place prepared for the purpose, and there tortured to death.

Mr. Bergh's proposition is, that the whole matter pertaining to dogs in this city shall be turned over to his society; that a proper place shall be provided for the reception of the dogs, and that after a reasonable time has been allowed for their owners to reclaim them, all remaining unclaimed shall be put to death in a merciful and and painful manner. Mr. Morris's plan, that a license should be taken out and a fee paid for every dog, is an excellent one, and if it is enforced, our streets will soon be rid of curs; only, we think that the fee should be made $5 instead of $2.

A GOOD OMEN.—The first application for an entry blank for the forthcoming New York Bench Show was received from a lady. We regard this as a good omen, the managers having counted upon a large entry of pets. Nor will the prizes for these classes be less valuable than for the others, as several ladies of this city have already presented valuable cups for Skyes, Pugs, etc. The entry in question is of pure English Toy Terrier, the mother and father of which have taken the first prize at the Crystal and Alexandria Palace shows.

—Mr. H. R. Bostwick, of Atchison, Kansas, writes to claim the name of "Fanny Esler" for his white-and-black ticked puppy, born Aug. 16, 1876; dam, C. F. Demuth's (Fort Dodge, Iowa) imported Laverack bitch, Pickles; sire, Arnold Burgess' Rob Roy. He says that Fanny is the perfect image of her sire, both in markings and in build, and promises to make a field dog that will be hard to beat.

—Mr. F. B. Farnsworth, of Paris, Ontario, has sold his imported Field Trial setter bitch, Rose, to Mr. J. H. Dodge, of Detroit. The price, we understand, was $300. Mr. Houghton's (of Detroit) Fan visited Carlowitz on the 12th ult.

ST. LOUIS KENNEL CLUB.—Rowe's Peg and Waddell & Sherwood's Daisy have visited Rock. F. H. Bierbower's Katty, by Plunket, out of Kitty, has visited Erin.

THE FOREST CITY KENNEL.—Mr. Mathews's Fan (of Toledo, O), visited Plunket last week, and Dr. S. J. Croym's (of Chicago) Belle has visited Rapp.

TICKS ON DOGS AND HORSES.—A correspondent writes from Santa Fé, New Mexico, under date of March 3, as follows: "In your issue of February 22d your correspondent, 'Fred. L. R., Longwood, Fla.,' complains of ticks troubling his horses and dogs, and asks 'what will take them off,' etc. While serving in Texas I met with the trouble he complains of, and allow me to differ with you in your advice—'the ticks must be picked off in the first place.' If the tick be picked off, its head is invariably pulled off and left in the flesh to fester and create a sore. Any kind of oil will make the tick let go of its own accord, if well rubbed into the hair of the animal. The theory is, that the oil fills the pores of the skin and deprives the tick of air to breathe. However correct or incorrect the theory may be, the practice is good, and it is the only safe way of getting rid of ticks when they have taken hold. I believe the 'seed-tick' and 'wooded-tick' are found in all the Southern States, in bushy or wooded districts; and experience has taught me that they are as fond of the human as of the brute creation.

"Yours truly, C. A. STEDMAN."

[Our answer was given to our first correspondent under the impression that he was alluding to that swollen, red, disgusting looking tick, which, in California particularly, affix themselves to a dog's skin, usually about the head and ears. Those we have found could be picked off, or pulled out, by using a little care, and our instructions from the natives were always to burn them if possible. We are much indebted to our correspondent for his letter. We are quite aware that the use of oil is most efficacious. It is well known that grease will destroy, or disperse, lice and fleas.—ED].

A SIMPLE DISINFECTANT.—One pound of green copperas, costing seven cents, dissolved in one quart of water, and poured down a water-closet, will effectually concentrate and destroy the foulest smells. On board ships and steamboats, about hotels, and other public places, there is nothing so nice to purify the air. Simple green copperas, dissolved in anything, will render a hospital or other place for the sick free from unpleasant smells. In fish markets, slaughter houses, sinks, and wherever there are offensive gases, dissolve copperas, and sprinkle it about, and in a few days the smell will all pass away. If a cat, rat, or mouse dies about the house, and sends forth an offensive gas, place some dissolved copperas in an open vessel near the place where the nuisance is, and it will purify the atmosphere. Then keep all clean.

SEAWANHAKA YACHT CLUB.—In publishing last week a report of the recent meeting of the Seawanhaka Yacht Club, the programme of races adopted was accidentally omitted. It was as follows:

First Race.—To come off on June 16th; open to all clubs, with the usual restrictions. This is to be a Corinthian race for first and second-class sloops and second-class schooners; one prize in each class of $150, making the amount for prizes $450. The steamboat to cost not more than $200, and the lunch $250.

Second Race.—To come off on June 23d; an ocean race for first and second-class schooners; owners to command and steer their own boats, with the usual restrictions. One prize in each class of $200, making $400 for prizes. The steamboat to cost $125 and the lunch $60. Two entries in each class, and no race in the class that fails so to fill.

Third Race.—Annual regatta of Oyster Bay, July 4th; there being five prizes of the value of $50 each, making $250. The steamboat to cost not over $125, and the lunch $50.

Fourth Race.—To come off July 28th; a race for open boats at Oyster Bay, one prize in each class of the value of $50, making $100 for prizes.

Fifth Race.—A series of four races for open boats, to be sailed at Oyster Bay on the last four Saturdays of September. The prizes to be of the value of $50 in each class, said prizes to be awarded to the boats scoring the greatest number of victories, a "walk over" to count. Should there be a tie, it will be sailed off on October 3 over the usual club course.

Sixth Race.—"Ladies' Day" regatta, to come off in September, the date to be appointed by the Commodore. The prizes to be colors in each class, to the value of $150; the expenses not to exceed $50.

NEW BEDFORD YACHT CLUB.—A meeting of this club was held at the new club-house on the 16th inst., the object being to adopt a constitution and by-laws. The following was adopted:

"The name of the club is fixed as the New Bedford Yacht Club, and the officers are to consist of a commodore, vice-commodore, captain, secretary, treasurer, measurer, and twelve directors. The admission fee is to consist of five dollars, and the annual fee five dollars. The club will also admit a limited number of honorary members.

Charles F. Monroe, Peleg Macomber, and Walter Myrick were appointed a committee to nominate a list of officers, and reported the following list, which was adopted:

Commodore, John A. Hawes; Vice-Commodore, Edgar B. Hammond; Captain, Thomas G. Wing; Secretary, George W. Parker; Treasurer, Edwin Dews; Measurer, Willard Nye, Jr.

Directors, George W. Parker, Frank C. Bancroft, John H. Garnett, C. Warren Fisher, James R. Forbes, Alfred G. Alley, Charles F. Monroe, Gilbert D. Kingman, Robert S. Lawton, William Sanders, Joseph A. Bullard, Henry F. Hammond.

Thomas G. Wing was appointed treasurer *pro tem.*, and a large proportion of those present paid the entering fee as an earnest that they meant business. It was stated that 44 persons had already placed their names upon the books, and that 13 names additional had been presented for consideration, all being oarsmen or yachtmen of repute. The club starts under most favorable auspices, and we anticipate recording many stirring contests in the waters of Buzzards Bay.

ST. AUGUSTINE YACHT CLUB.—The 4th annual Regatta of the St. Augustine Yacht Club took place on March 17th. The "Idlewild,"—J. W. Keep—received the first prize in the 2d-class yachts, by time allowance from the "Neptune," Vice-Com. Morrison. The "Henrietta," N. Edgar, won the prize of the special class yachts, and the "Carrie," R. Pinkham, in the 3d-class. In the contest between the canoes "Emma" and "Ella" of the St. John's Canoe Club, the former won; and the fisherman's canoe, "Mullet," by Benet, won in her class. The race between the gigs of the Bache and yacht Wanderer, manned by men from the respective boats, was won by the Wanderer's crew.

SCIENTIFIC APPARATUS FOR TAKING FLYING SOUNDINGS.—The apparatus for taking flying soundings—an English invention—has attracted much notice from nautical men. It consists of an oval weight of lead, thirty pounds, attached by half a fathom of hemp cord to a ring or thimble properly secured on one end of a length of two hundred fathoms of piano forte wire coiled on an exceedingly light wheel of thin galvanized sheet iron of about a foot diameter, mounted on a frame-work fixed in a convenient position on the ship's taffrail. The wheel has a second rim, with a simple kind of friction brake, by which a constant force of five pounds is applied to it when the wire is running out. There is also attached to the same shaft a ratchet wheel and pawl, which can be thrown out of gear or into gear at pleasure. A counter to count up 200 turns completes the apparatus. To take a sounding by it the plan is to let the weight hang by a short cord direct from the wheel and clear of the taffrail, and then to lift the pawl and throw it out of gear, holding the wheel by hand till ready to begin, then to let go the rim and stand by. The moment the wheel is heard to go slower the rim is to be laid hold of with both hands, protected by a piece of canvas or thick leather gloves, and stopped. It is only necessary to read the counter, and the sounding is complete. Two men, working on handles applied for the purpose, haul in the wire and recover the lead easily and speedily.

Rational Pastimes.

SKATING.

Ice skating ended in the metropolis the last of February, since which time the in-door form of skating on the Plympton patent roller skates has become a popular recreation, especially with the fashionable class of society in Brooklyn, where no less than four roller skating halls are now in operation; on the Rink in Clermont avenue, Gallatin Hall on Fulton avenue, Burnham's Academy on Schermerhorn street, and Apollo Hall in Williamsburgh. The Rink is the largest building, but it is not managed on the best interests of the new exercise, inasmuch as the high-pressure Parisian system of variety performance has been the plan pursued on the special entertainment nights, and the result has been a large falling off of the patronage. People prefer to see exhibitions of graceful figure skating, in the place of mere trials of speed and endurance in the form of dangerous hurdle races and steeple chases on rollers. The best arrangement in the way of catering for society people, is that introduced at Burnham's Gymnasium, which was opened on Wednesday night last. The popular plan of moderate prices is pursued as Gallatin Hall and Apollo, where no rapid skating is allowed, and crowds are attracted nightly to see the exhibitions of figure skating.

CRICKET.

—The annual meeting of the Young America Cricket Club, of Germantown, took place on Tuesday week, at Wilson Hall, Philadelphia. The officers of the ensuing year are as follows: President, E. M. Davis, Jr.; Vice-President, T. P. C. Stokes; Secretary, J. Waln Vaux; Treasurer, E. N. Wright, Jr.; Ground Committee, George M. Newhall, Sidney L. Wright, Edward Waln, Jr. The Secretary's report gave a full account of last year's business and the averages of the first eleven as follows: R. S. Newhall, 33; George M. Newhall, 26 3-7; E. N. Wright, Jr., 26; D. S. Newhall, 25½; John B. Large, 24½; R. Loper Baird, 14 1-6; H. L. Newhall, 14; C. A. Newhall, 12; Thomas Baxter, 9 4-5; Harry Stocker, 7; A. A. Vanrensallaer, 6; E. S. Buckley, Jr., 6; F. C. Baird, 5¾; E. W. Clark, 5. The Treasurer's report was well received, there being a cash balance of over one hundred dollars on hand. The prospect for the coming year is very promising, Lord Harris having written to say that Mr. G. W. Grace and himself intend getting up a gentleman team to come over in the fall to play Canada and "The States."

—"I don't call that binding," as the sick man said of the castor oil.

New Publications.

MAGAZINES.

The opening paper in *Appleton's Journal* for April is on the Austrian Arctic Expedition, derived from Julius Payer's "New Lands Within the Arctic Circle." The article is illustrated with fifteen excellent engravings, depicting the scenes and incidents of the expedition. The other articles of the number are of notable variety—an excellent short story of New York life, by Thomas Dunn English; one by the lamented young Albert F. Webster, the last production from his pen, bearing the title of "The Owner of Lara;" a third, entitled "The Wild Dove's Nest," a Russian Easter story. There is an entertaining sketch under the title of "A Hero of the Old Régime," which describes the remarkable career of the Marshal de Richelieu, and a paper by Geo. Cary Eggleston, on "Phases of Russian Life," which contains many interesting facts. "Cherry Ripe!" is continued, and is full of fresh interest. There are other papers, poems, etc., and the editor, who discusses many current topics, gives some statistics in regard to the New York savings-banks, which are of great value, and prove the general trustworthy character of these institutions.

Good habits learned in youth are apt to remain fixed through life. This is one reason why B. T. Babbitt's Toilet Soap is certain to become, by and by, a monopoly in the toilet line, beyond all question, the chief. Custom from babyhood up will make this the most desirable and pleasing of all articles in use, for what is good for the child will be no less valuable for the man and woman.—*Adv.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

Adv.

THE

FAVORITE FIELD JOURNAL

OF AMERICA.

—o—

OPINIONS OF THE PRESS.

This paper is a model of typographical neatness, and its contents are sufficiently varied and interesting to secure for it a cordial reception from that class of the public to whose taste it caters.—[New York Times.

It is a handsome sheet, filled with a variety of very interesting reading.—[New York Sun.

There is need for an advocate to make the American people more in love with outdoor life, and FOREST AND STREAM does the work admirably. The various departments are edited with knowledge and skill.—[New York Journal of Commerce.

Its prepossessing appearance is no slight confirmation of its claim to a high and manly tone in its conduct.—[Home Journal.

It is tastefully arranged and handsomely printed, and seems to be well adapted to persons of cultivated tastes.—[New York Tribune.

Mr. Hallock is an enthusiastic sportsman, a good writer, and competent to make a "sporting paper" fit for household reading.—[New York Commercial Advertiser.

We commend with special earnestness the claims of FOREST AND STREAM to favorable attention.—[The South.

We may safely predict its success.—[New Orleans Home Journal.

It is neat as to typography and varied and interesting as to contents.—[Hartford Times.

It occupies its own position, intruding upon no preoccupied ground, but it is an elevated position. To sportsmen of the gun and fishing-rod it is invaluable.—[Brooklyn Review.

Got up in a handsome manner, both as to presswork and arrangement of contents.—[Philadelphia Ledger.

It is decidedly the most *recherche* thing of the kind ever issued in this country, and as far as we know is the peer of anything similar in England. All its departments show a practical and intellectual filling up which challenges general favor.—[Germantown Telegraph.

We can unhesitatingly recommend the FOREST AND STREAM to all who take an interest in outdoor recreation and physical culture.—[Every Evening, (Wilmington, Delaware).

The terms are very reasonable for such a large and necessarily expensive paper. We commend it to our sportsmen friends most heartily. We like the ring of its editorials, evidently written by the true Lover of nature in its multiplied and beautiful forms.—[Niagara Falls Gazette.

There is a standard of excellence and usefulness not yet attained by any sporting paper in the country, and FOREST AND STREAM will find its success at the top of the ladder.—[New York Graphic.

It covers ground not occupied by any other journal.—Waterloo (New York) Observer.

Sincerely hope it will live long and prosper. It certainly deserves success.—[Springfield (Mass.) Union.

Health, longevity, and happiness largely depend upon such open air pursuits, and a journal like this is the best means to effect the object.—[Portland (Me.) Argus.

"FOREST AND STREAM" is the most reliable and thorough Sportsmen's journal in America.—[St. Lawrence Advance, (Chatham, Canada.)

WHAT THE PEOPLE SAY.

I hope you will meet with entire success in your project. My days of active life in the field and forest have gone by, but I recall my experience with pleasure, and I feel that I owe my health in a good degree to early habits of free exercise in the open air in forests and along streams.—Horatio Seymour.

There is a demand for just such a paper as this. It will give me very great pleasure, indeed, to do all I can to help your journal.—[Professor S. F. Baird, Smithsonian Institute.

I have no doubt that FOREST AND STREAM will have a large circulation. Consider me a subscriber.—[George A. Boardman, Naturalist.

Such a journal, and conducted upon the principles and with the spirit which you announce, will certainly find warm support.—[Rev. J. Clement French.

I have no doubt you will make a marked success.—[Hon. J. D. Caton.

I wish you the best sort of success in your effort to make such a journal of outdoor sports as a gentleman can read and write in.—[Charles D. Warner.

I doubt not it will be a great success. It is wanted, and must be called for.—[Major John H. King, U. S. A.

I have long wished just such a journal to receive into my family, that my boys may learn from a better teacher than myself the best way in which to follow the sports that in years past have given me so much pleasure.—[Henry W. Abbott, Boston.

Under your management it ought to be a success.—[W. H. Venning, Inspector Marine and Fisheries, Canada.

You shall have all the aid and comfort I can give you in your enterprise.—[Com. L. A. Beardslee, Washington Navy Yard.

I must congratulate you on the very attractive appearance of your paper. Keep it up to the standard you have marked out for it, and it will become an assured success.—[Rev. Charles F. Deems.

Nothing but the exigencies of my roving life have prevented me from starting, or trying to start, just such a journal as yours. You shall have my hearty cooperation.—[Professor Elliott Coues, Smithsonian Institute.

Your paper is just what we have long wanted, and will take well in the Southern States.—[Dr. R. P. Myers, Savannah, Ga.

The editorial matter, the contributions, and the make-up and general appearance of the paper are just such as Fish-rod and Nimrod admire.—[Genio C. Scott.

I am glad to hear of your literary enterprise. It will give me pleasure to put you, or any one else representing the FOREST AND STREAM, in the way of getting information for your paper.—[Andrew H. Green, Comptroller, and Central Park Com'r.

"I take the heartiest interest in FOREST AND STREAM. I have always thought that an American "Land and Water" was needed, and that many valuable observations are yearly lost, through the want of some such medium of communication between field-naturalists."—[Prof. G. Browne Goode, Middletown University.

I wish the FOREST AND STREAM every success, and will be most happy to lend any assistance in my power to make it so.—[Hon. Robert B. Roosevelt.

Success to your enterprise. I think the field a broad one, and not yet occupied to any good purpose.—[Prof. N. A. Newton, Yale College.

You have got a handsome paper, and one admirably made up. I hope you will continue in your success.—[J. M. Bailey, Editor Danbury News.

The Surveyor General of Washington Territory, who sends us a club of five subscribers, writes, saying: "I consider that your journal has done more to properly educate the sportsmen of this country than all the other publications put together. I shall induce every true sportsman to become a subscriber that I can."

Mr. Thomas A. Logan ("Gloan") says: * * * You are doing good work with the paper, and you have—more and probably greater than you dream of—the wishes and God speed of the *gentlemen of the gun.*"

I inclose herewith, the price of one year's subscription to your very interesting paper. I wish to be considered a subscriber.—[Gen. Wm. S. Harney, U. S. A.

Benj. Smith, Esq., member of council of the Nova Scotia Game Protective Society, says of FOREST AND STREAM:—"Your paper has become so great a favorite among Canadian sportsmen as to be a *sine qua non.*"

Samuel Wilmot, Esq., Superintendent of the Dominion Fish Works, at Newcastle, Canada, in sending an official communication to FOREST AND STREAM, remarks:—"As your paper is becoming so widely distributed, it is the best medium by which any information of this kind can be disseminated."

I am pleased to see that the sportsmen of this country have one paper that is not *tied up* to any particular manufacturer. I hope you will continue to let all sportsmen that are honest and reliable express their views and experience through your paper, and let it be seen that sportsmen have *one* impartial paper in this country. You shall have my support as far as it goes.—[GEO. HALDEN, Jacksonville, Ill.

Inclosed find money to renew my subscription to your valuable journal, which has become a necessity to me.—[Gen. Wm. D. Whipple, U. S. A.

Hundreds of similar endorsements from prominent gentlemen sportsmen might be added, showing the estimation in which FOREST AND STREAM is held by its readers.

ADVERTISERS' TESTIMONY.

SEDALIA, Mo.

EDITOR FOREST AND STREAM:—
You would be surprised to see the number of letters I receive on account of your advertisement.
JAS. D. BROWN, G. P. A.,
Missouri, Kansas and Texas R. R.

—

GRAND RAPIDS, Mich.

EDITOR FOREST AND STREAM:—
I take great pleasure in sending copy for my advertisement, which please insert from May 1st. You did us a "power of good" last year. Wish all our advertising paid as well. J. H. PAGE, Grand Rapids and Ind. R. R.

—

ROCHESTER, N. Y.

EDITOR FOREST AND STREAM:—
We desire to say that we recognize as one of the most important sources of our successful introduction of "Vanity Fair" to the sportsmen of the United States, the valuable columns of FOREST AND STREAM, and advertisers who wish to bring their goods to the attention of the sportsmen of this country, would certainly be amply paid by patronizing your columns. WM. S. KIMBALL & CO.

—

VALPARAISO, Ind., Dec. 24th.

EDITOR FOREST AND STREAM:—
Since I began to advertise in your paper my trade has kept me at work night and day. I guess I will have to take out the advertisement, or let my gun rust; have no time for shooting, or anything else. But, on the second thought, let it run, because I would be a public benefactor, and am nearer that when making a good shooting jacket than any other time. Yours truly, W. H. HOLABIRD.

—

LISLE, Broom county, N. Y.

EDITOR FOREST AND STREAM:—
In renewing our advertisement of the Baker gun, I take much pleasure in informing you that your paper has been of much value to us, and greater than we anticipated, although previously convinced of its worth. Our correspondence has been very heavy, no less than between 800 and 900 letters having been received as inquiries resulting from the advertisement referred to.
We now find that it will be necessary to increase our facilities for manufacture to meet the growing demand for our gun. Respectfully, W. H. BAKER.

—

CANTON, N. Y.

EDITOR FOREST AND STREAM:—
There has hardly been a day since my advertisement appeared in your paper that I have not received from one to eight letters of inquiry from all parts of America. I have sold all the boats I had on hand and all I could build. I would like to send one to your office, and believe it would please you. Very truly, J. H. RUSHTON.

—

MANCHESTER, Vt.

EDITOR FOREST AND STREAM:—
As a result of the excellence of your paper as an advertising medium, I have received orders from nearly every State in the Union faster than I anticipated or was prepared for. FRANK GOOD.

Sportsmen's Routes.

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y
Respectfully invite attention to the
Superior Facilities

afforded by their lines for reaching most of the TROTTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of
The Pennsylvania Railroad Company
also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVA, BRADFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to
TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for BAIT WATER SPORT AFTER FIN AND FEATHER.

G. W. Simmons & Son,

32 to 38 North St., Oak Hall, Boston, Mass.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own.

The Boston Shooting Suit.'

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,

Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G.W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the "BOSTON SHOOTING SUITS" have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT $13, TO INCLUDE HAT OR DOUBLE VISORED CAP. DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT:—
BREAST MEASURE.
WAIST MEASURE.
INSIDE SEAM COAT SLEEVE,
INSIDE SEAM PANTALOONS.
SIZE OF HEAD.
MENTION HEIGHT AND WEIGHT.

Paints.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)

MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition

therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. CURLED OR WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE On

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

ADIRONDACK GUIDE.

BY E. R. WALLACE.

Gives all possible information relative to Routes, Hotels, Resorts, Outfits, Guides, Distances, &c., with amended railway schedules, &c.

The Only Complete Guide to the North Woods.

The instructions embrace everything that can be desired. Taking it all in all, it is the most complete book that has been published on the Adirondacks, not excepting even my own—*Hon. J. T. Headley.*

I regard your "Descriptive Guide" and the "Appendix" as a most useful—nay, indispensable, manual for tourists to that wonderful Wilderness. A tour in that region is eminently a practical matter, and for that reason I regard your "Guide" as an important, useful, and timely publication.—*Benson J. Lossing.*

It is the *only* thing of the kind that has yet been published—the very thing that has been so long wanted and waited for.—*Alfred B. Street*, Author of "Woods and Waters."

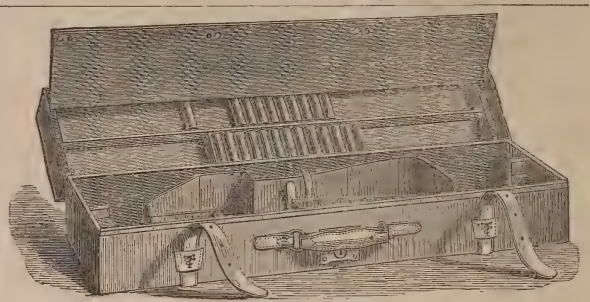
Sent by mail on receipt of price, $2.

FOREST AND STREAM PUB. CO.,

(by whom the copyright is now held.)

Aug 10 tf 17 Chatham street, N. Y. City.

W. & C. SCOTT & SON'S.



First Prize Medal and Diploma awarded Centennial Exhibition, for excellence of workmanship and material in their **Premier Quality** and medium grades. Their **New Patent Triplex** Lever Grip Action and **Compensating Lump.** The attention of sportsmen is requested to the above new action. Its superior strength and solidity impart greatly improved shooting powers. Hard hitting, being the desideratum required, is obtained by this powerful gun. Prices of the New Triplex Lever Grip, $175, $225 to $400. Marked the Triplex 10-bores extra. Our highest grade is as usual marked the PREMIER QUALITY.

Extract from FOREST AND STREAM, *New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial:*

This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about $10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

"EVEN AS THYSELF."

"E'en as a flower?"
No, fairest! not to me a flower;
The uncertain sun calls forth its odorous breath,
The sweetest perfume gives the speediest death,
The sport and victim of a summer hour.
Fairest—be not as a flower.

"E'en as a star?"
No, brightest! be not to me a star;
'Tis one of millions, and the hurrying cloud
Oft wraps the glittering splendor in its shroud;
Morn pales its lustre, and it shines afar.
Brightest—be not a star.

"E'en as a dove?"
No, purest! be not to me a dove:
The spoiler oft breaks in upon its rest,
Robbing the young bird of its soft nest.
And plunging silence through its native grove,
Purest—be not a dove.

"E'en as a rock?"
No, my most faithful! be not as a rock;
It mocks the embracing wave, and stands alone,
In loveless gloom, in dreary wastes unknown,
Senseless alike to Fortune's smile or shock.
Changeless—be not a rock.

"E'en as thyself?"
My soul's best idol! be but as thyself,
Brighter than star, fairer than flower,
Purer than dove, and in thy spirit's power,
Steadier than rock,
Dearest—be but thyself.

For Forest and Stream.

The Club-Footed Buck.

BY "JOX."

HAVING read in the Forest and Stream accounts of successful hunts in different parts of the country, I thought, perhaps, it might be of interest to your readers to hear how one hunter in this section had hunted for three years after one deer, the truth of which is vouched for. It was on the upper waters of the Susquehanna, in Clearfield County, Pa.; and one night, as we lounged about the shanty, Jacob, our guide—always "Jake," for short—suddenly said that he had that day "crossed the trail of Old Club-Foot."

This remark on the part of Jake excited the curiosity of some of the party, who failed to understand just what he meant by "Old Club-Foot," and therefore called upon him for an explanation. He had known this particular deer for the past three years, his attention having first been attracted by the peculiarity of his trail. When he traveled slowly, as if in a walk, he made about double as many tracks in the snow as any other deer, and here and there was an angling scrape across the trail from left to right. When hard pressed, he made prodigious leaps, leaving each time, as he alighted, a hole prodded backward between the tracks of his hind feet. The cause of these strange marks was a mystery, which every hunter who ever came across him was anxious to solve. Jake's theory was, that he had been shot in the shoulder, so as to disable his right fore-leg (and, in fact, there is an old hunter in this neighborhood, who declares that he shot him in the shoulder), but his tremendous leaps would appear to oppose this view of the case. However, Jake looked at the matter in his own light, and for that reason had called him the "Club-Footed Buck"—a name by which he was known all through the section of country over which he ranged.

He received much attention, not only from Jake, but also from many others, and so numerous were the bullet holes claimed, that if his hide contained them all, it would resemble the lid of a pepper-box.

He was possessed of cunning almost human, as the following will serve to illustrate: It is a well-known characteristic of the deer to always make a circle, and come back to within sight of his track before lying down, so that anything passing on the track could be seen long before the deer himself could be seen; but the buck of which I write has been known to circle around as often as five and six times, and then move off and lie down on high ground. He invariably made from two to three circles before risking a halt, and would thus have ample time and opportunity to observe his pursuers, if his hearing failed him, which it rarely did. To get a shot at him from the rear was next to impossible, and it was almost as difficult to hit him from in front, unless he was driven from the rear, and would come upon the watcher soon after being started, for he would not run long on one track.

Well, the club-footed buck had become so notorious that he was thought to be a prize worth striving to win, and Jake has been spending much time each season, during the past three years, in crawling after him—on his hands and knees, I might say—but he invariably escaped. For the first time during the season, just closed, Jake discovered his track early one morning in the latter part of November, and he immediately sent a man in on his track, while he himself, and two others, went to watch the "crossings;" but the old buck was too sharp to keep on the accustomed run-ways, and three times in succession, on three different ridges, he escaped the watchers, always scenting his enemies, and passing over, just out of shot, as would be found when the driver came up on his track.

There was one more chance. Jake arranged things with the greatest precision and judgment, determined that nothing but some new dodge on the part of the old buck should frustrate his designs. It was the driver who came very near doing the mischief this time, by being too hasty; for scarcely had Jake reached his post, and stepped upon an old root to have a fair out-look, when he saw the buck coming directly toward him. He leveled his rifle on an opening in the bushes, into which he knew the buck would jump, and had but a moment to wait until his sights were darkened, when he sent a bullet whizzing in that direction. The buck raised up on his hind-legs, like a kangaroo, and quick as a flash was off over the hill, in the opposite direction. It was but a few minutes until all four of the hunters appeared on the brow of the hill, just in time to see him leaping up the opposite slope, several hundred yards distant, having passed through an almost impenetrable laurel bed. With a parting volley from four rifles, the club-footed buck made his escape for that day. But Jake was not through with him, nor had he left him entirely uninjured this time, for there were blood marks all along his trail, and on the bushes, so high up that it was supposed he had struck him in the neck. The following night it snowed heavily, and for two weeks the buck hid himself completely. Finally, in the second week in December, the writer and three others, all novices, went to spend the balance of the season with Jake. Having occupied several days in unsuccessfully hunting over the hills, we were becoming a little low-spirited, when new interest was inspired by Jake's remark, that he had seen the track of this famous buck, and his recital of the foregoing made each one still more anxious to try his metal. We "turned in" at rather a late hour, but nevertheless were up early in the morning, impatient for the start.

By the time we had breakfasted all was in readiness; Jake had made up his mind that this particular deer was not to be his meat, and he replaced his gun upon the pegs, with the remark, that he would follow the track, and give each one of us an equal chance to put a feather in our cap.

Now, one of the party, who was particularly anxious to slay this rival of the Creedmoor sheet-iron deer, reached for Jake's rifle, as well as his own, and started off with the two double-barrelled weapons, one on each shoulder. The first watch was about a mile from camp, and here the man with the guns halted, resting his arsenal against a jack-pine. After Jake had put the rest of us in position, he took his way off to one side of the thicket, striking the track where he had the day before discovered it. In about half an hour the toot-toot of Jake's tin horn reached our ears, and each one looked anxiously for the buck to come his way. Three of us were disappointed, for suddenly, from the direction of the first watch, came bang! bang! in close succession. The second shot settled the question, to be sure, and all hands made haste to have the first look at the hero of so many battles, and to congratulate our comrade on his good fortune; but when we arrived on the ground, there he stood, with Jake's gun in his hands, and casting upon it the most contemptuous look. The buck had passed him at about seventy-five yards, but, he said Jake's gun was too light on the trigger, and he had discharged both barrels without having it to his shoulder either time. No, he didn't get the ague, but he had forgotten to take off his mittens! As boys are wont to do who are hunting for amusement, we wasted considerable time in making sport, at the expense of our crest-fallen companion, but were called to order by Jake, who said: "Well, boys, don't fool your time away. We must give old Club-Foot another heat."

We started off, to make the next crossing, but before we reached it, we came upon two fresh tracks, and Jake decided that it was best to take these, and leave the old buck for the next day. We accordingly dispersed to the four sides of the thickets, while Jake went in; and he was not long in bringing out a fine doe and a well-grown fawn. The doe was "brought down" by one of our number, but the fawn made good use of its legs, and escaped. When Jake had dressed the doe—he was Master of Ceremony here, as elsewhere—we "snaked" the carcass to camp, being somewhat elated over our trifling success, and were satisfied to lay over until the next morning. We were all in a happy mood that night, and, before going to bunk, a preamble and resolution were adopted, expressive of the sentiment of the crew, which set forth that no man should carry more than one rifle; and, secondly, that it was inexcusable to attempt to shoot with mittens on, unless a bad case of ague should be acknowledged!

We were out again early the next morning, eager for the fray. We partook of a hastily-prepared breakfast, examined the priming of our guns, and started. After a brisk walk of about three miles, we arrived in the neighborhood of where we supposed the old buck would be, examined the ground, and found that he had not passed over the ridge, and quietly scattered out, and took our stations. It was a cold day, with a strong, cutting wind, and I had kept my stand until about half frozen, and had made up my mind that the shrewd old fellow had given us the slip, although we thought we had him so nicely caged. My reverie was disturbed by the well-known signal from Jake's horn, and taking another look in the direction from which the sound came, I saw the old buck bounding toward me, in such a way that he would cross in front of me at an angle. He came to within about sixty yards and stopped, broadside, close beside a clump of chestnut saplings. The instant he stopped he turned his head to look back, and I did not wait for a better opportunity, notwithstanding the sapling. With the crack of my gun, he raised upon his hind-legs, as he had previously done, and was out of sight in the opposite direction long before I was ready with another load. I found blood where he had stood, and would probably have killed him; but a scar on one of the chestnut bushes told the tale. This time he had almost baffled Jake by his repeated circling around on the night before, and on this occasion he also exhibited shrewdness which surpassed any of his former tricks. He followed on the last circle he had made until he came to an old log, thickly grown about with bushes, off to one side, when he made a tremendous leap over the log, without leaving any suspicious marks in his trail, thus delaying Jake for some time in hunting his track.

We took his trail, and followed it until darkness set in; but, although bleeding all the way along, he was apparently little hurt by my shot. The next morning we resumed the chase; he traveled as well as ever. By noon we had driven him back to within two miles of camp. With the exception of Jake, we returned to camp for dinner, but this time we couldn't coax him off with promises of a warm dinner, as we had always succeeded in doing before. We had not left him long, when he found that the old buck was again resorting to his circus-ring business, and Jake immediately left the track, and went around, and came in from the opposite direction. It appears that the buck, for the nonce, had lost a little of his customary shrewdness, for, so entirely absorbed was he in watching his back track, that Jake came upon him lying down. He was shrewd enough still, however, to lie down behind a log, so that nothing but his head could have been seen from his track. Jake chuckled, and slowly and deliberately brought his rifle to a level with his eye; he knew that he was unobserved, and could afford to be deliberate. "After many weary years" this was *too much* satisfaction! He hesitated. He chuckled again, and enjoyed his position too much to be in a hurry; but he thought "now, or perhaps never," and pulled the trigger. The old buck, imagining the shot to have come from the direction of his track, leaped up, and almost ran over Jake, who, to make the matter certain, gave him the contents of the other barrel as he passed, "on the wing." With a few more leaps, he was out of sight. Jake reloaded, and following up, found the buck lying dead near by.

At last! It was great satisfaction to Jake, to be sure; but the chagrin of four boys can better be imagined than described, as they saw the former dragging the old buck down the hill toward camp. I, for one, however, did not begrudge him his good fortune, for he was deserving of it, if ever a persevering hunter was.

The first thing in order was a close inspection of the noble slain. He was a large deer, measuring six feet along the spine. The mystery concerning his trail was solved. His right shoulder was out of place, the shoulder-blade lying close against, and parallel with, the spine. The right fore-leg was ten inches shorter than the left, and the cords contracted in such a way as to keep it drawn across to the left side, and bent up toward the body at the knee. The leg was, of course, useless, and like any other four-footed animal similarly situated, he could run without much difficulty; but to walk, it would be necessary for him to

gather himself up on his hind-feet, while the one fore-leg stood still, and then raising on his hind feet, and coming down at full length on his front one, repeat the operation. Thus the numerous tracks are accounted for. The ribs on the right side were about five inches shorter than on the other, and this, together with the short leg, go to show that he was injured while a fawn, and the growth of the right side thereby retarded.

After this critical examination, he was hung up to be dressed, and we were all anxious to see the scores (?) of bullet marks the pulling off of his hide would disclose, and solve another mystery, viz., why he had not been killed by any of them. First, came two holes in the hips, made by the same ball, that gave evidence of being probably a month old; then four fresh ones through the body, back of the lights, the result of Jake's last shots. Now came the lame shoulder; but when it was stripped, the closest examination failed to disclose a bullet wound, or a wound of any kind. The shoulders had, in all probability, been displaced by a fall upon a rocky hill-side. In despair, I continued hauling the skin off, until the ears were reached, but still no mark for my shot—the head was sound also; but finally I discovered a small, fresh bullet hole through the thick part of the ear, which set my mind at ease.

When those "old hunters" claimed bullet holes in the hide of the Club-Footed Buck, they probably thought that he was bullet-proof, and would never be killed for examination. After the hide was hung over the pole, the venison quartered, and we were all seated in the shanty, Jake looked at the floor, and soliloquized: "Well, I'm a'most sorry I killed old Club-Foot. When I couldn't find any other, I could always hunt him up, and hoof him around awhile."

For Forest and Stream.

SOME INCIDENTS ON A WHALER.

"YES," said our friend, Mr. B——, "I have had some rough experiences, and when I was on the whaler I saw some things I would gladly forget.

"A portion of the ship's crew were Portugees, and good sailors, but unprincipled men, and their company was anything but agreeable to me, and before I had been long on board I heartily wished myself at home once more.

"I was the youngest child in my father's house, and had never known hardship, but had been indulged even more than the other children. But home had become insipid to me, and I did not appreciate my friends there. I fancied they were very unlike the rest of the world—staid and, in fact, queer; and I ran away at length, and that is how I came to be on the whaler.

"The new men, I mean those that had never before sailed seas over, came on board dressed in their new uniforms, and walked about the vessel with an important air, and imagined that the suits made them sailors, but before many days seasickness overcame them, the shiny belts were lying here and there, and the becoming blue shirts were carelessly donned, and the countenances lost their important expression, and we all concluded that a uniform did not make a seaman.

"As for myself, I stood the tossing and the tide, and was never seasick but once; and then only for a few hours.

"Among the new men, as they were called, was one we named Carpenter. Now Carpenter was, of all the men, the most sullen and brooding.

"He had enlisted while in a state of intoxication, and had sorely repented of it when he became sober, and seemed to be constantly discontented and moody.

"Our Captain, Capt. Cook, was quite an elderly man, and was cross, impatient, and sometimes even violent.

"After we had been out a few weeks, there was quite a commotion in the ship one day, because two pair of shoes were found in an out of way place, and the Captain quickly recognized them as part of a box he had brought out with him.

"He ordered the men's trunks searched, and in Carpenter's was found another pair, and still another in the trunk of a sailor we called Curly.

"'How did this happen?' thundered the Captain, when we were all brought up before him.

"'I stole those shoes, Captain Cook, and I gave the pair to Curly,' said Carpenter, calmly.

"'Well, you will repent of it,' answered the Captain, angrily.

"Now Carpenter had done the deed, hoping he would be put on shore at the first opportunity after it was discovered; but he was sadly disappointed; he was put in the hold and kept there a month, and fed on bread and water, and when he was brought out to the light what a sorry looking object he was, pale, emaciated, and so weak he could scarcely stand.

"But his punishment was not yet ended; he was tied up by the thumbs to the mast, and then Captain Cook, with a tarred rope in hand, approached him. 'Now Carpenter,' said the Captain, 'I am going to make you dance in your blood,' and then truly he lashed the poor man till the blood ran from his back.

"We were now not far from a small island (our friend told us where this island was, and what was its name; but we have forgotten this part of the story); Carpenter was then made to dress in the worst suit he owned, all his pockets were searched, and the contents taken from them; among other trinkets was found a picture, and when Mr. Smith, the first mate, took this in his hand, Carpenter said, 'Mr. Smith, that is my wife and child, do not take it from me; please give it back,' and the culprit spoke imploringly, and held out his hand. But the first mate put the picture in his own pocket. Carpenter's clothes were all taken from him, with the exception of the one suit, and he was put into a boat and rowed to the island referred to above. The first mate went with us to the island, and when Carpenter was put on shore, and we were about to shove off again, the latter said, 'Mr. Smith, if you'll give me back that picture, I'll forgive all the rest of the injuries.'

"But Mr. Smith did not heed the request, and we rowed back to the vessel, leaving poor Carpenter in the lurch, though this was not an uninhabited island. I was not surprised at the Captain's acting as he did in the matter; but our first-mate was a good, kind man, and it seemed strange that he should withhold from the poor man so sacred a reminder of home as the picture so dear to him. 'Now,' said Mr. B——, 'we might make a great hero of Carpenter, but will not hide the truth. He was a rough, bad fellow, and perhaps deserved almost all the punishment he received, but it did not seem to be the sort to make him better.'

"After my three years voyage was over, I saw Carpenter in New Bedford, which proves that he got back to home and friends.

"And now I will tell you about the death of our poor Captain, which accidentally occurred. As the months went by Captain Cook became dissatisfied because we took in oil so slowly, more slowly, in fact, than some other vessels. So he determined to have more work done; and picked out the best men to man two boats that were to go in search of oil. In one of these boats he took his place, and I was one of the men.

"After we set out we soon saw a whale coming directly toward us. The lookout gave warning of this, and our Captain growled out, 'Let her come,' determined to take it at all hazards. It is considered a perilous undertaking to try to take a whale in this way, but we were ordered to go to work, and the fish was soon wounded. The Captain was all the while excited and cross, and when one of the boys made a misstroke with his oar, he threatened to send a boat cup through his head. Scarcely had Captain C—— spoke thus roughly, when the whale came up under the boat and went flukes, as the sailors say, which threw us up in the air as quickly as if we had been shot. I found myself in the water, going down, down, down, so deep, so far, that it seemed to me that I never would stop; yet I was not greatly frightened; one shoe slipped off, and I wondered if I had not better throw of the other, as an odd one would be of no use. I was a little afraid of sharks, though even then I believe I remembered that it is thought the sharks never bite a man while the water is bloody from a wounded whale; I was also fearful of coming up under the capsized boat. After what seemed a much longer time than it actually was, I came up to the surface, and found the men clinging to the broken boat; and the second mate was holding up the Captain, who apparently was not able to take care of himself. We all roared, and beckoned to those in the other boat to come and help us.

"'Here,' said the mate, 'John, hold on to the old man, don't let go of him,' and he entrusted the half-fainting Captain to one of the Portugee sailors. The men in the other boat came to our assistance, and we were all soon picked up, with the exception of the Captain, who was missing.

"'John, where is the old man? what have you done with him?' asked the mate, sternly, looking hard at the Portugee who had last hold of the unfortunate Captain.

"'A shark took him out of my hand,' said John.

"No one at the time knew further than this; the poor, old Captain was gone, and the sea tells no secrets; it hides well and deep. Afterward the said John told a different story; said the Captain's jaw was all knocked away, and he could not understand what he said, and there was a heavy sea and he could not hold on to him.

"Perhaps the Captain was injured when the boat was thrown up so violently, but we could not know about the certainty of that, and we all suspected that the Portugee did not try hard to save him. The Captain was disliked, and John was rascally, but all that we can say with certainty is, that the old Captain will sleep in the deep till the sea gives up its dead. We succeeded afterward in killing the whale that had caused the accident."

A. D. H.

For Forest and Stream.

NOTES FROM THE COAST RANGE.

AFTER a dreary ride, of a day and a night, from Gilroy, then the terminus of the Southern Pacific Railroad, south through the uninteresting Salinas Valley, we dismounted from the stage in front of the Paso Robles Hotel, and stretched our weary legs on the ample portico in front. Twenty-four hours of continuous stage riding, behind six unbroken mustangs, and over equally unbroken roads, is not conducive to good nature, and it was not, until we had put ourselves outside a liberal quantity of mine host's excellent venison, that we felt thoroughly at ease, and like looking around to see what manner of place we had dropped down at.

Some time before our arrival we had left the sterile Salinas, and had been clambering over hills and down cañons, and through beautiful parks of moss-covered oak, totally devoid of underbrush, unless for an occasional *manzanita*, with its strong, red branches, and green, juicy-looking leaves, ribbed with scarlet. These natural parks are many hundred acres in area, but gradually narrowed down as we neared the hotel, until, half a mile beyond it, the river touched the hills, and gave the place its name—*Paso Robles*—Pass of the Oak's.

In front of the hotel, and its surrounding cottages, flanked by an immense cañon and masses of chaparral, bubbled a hot sulphur spring, whose waters were considered, by the proprietor, at least, a cure-all for mankind. Beyond this the river ran between banks wooded with cotton-wood and heavy underbrush; still beyond the country rolled in undulating waves to the eastward, crossed here and there by cañons, and dotted by little plains—favorite feeding-grounds for antelope. The cañon sides are almost invariably covered with oak, and their bottoms with underbrush. Back of the hotel and toward the sea (distant four leagues), the hills rose abruptly from the plains, their faces bare, or covered with brush knee-high.

In a cañon, among these hills, I had the honor of "jumping" my first grizzly. The day had been excessively warm, and I was strolling homeward, from a walk among them, when I noticed a particularly heavy bunch of *chaparral* below me. Thinking it a good place to find a drove of wild hogs, numbers of which roam the country, I got to leeward, and carefully worked down—and here let me say, that for acute hearing and keen scent, a deer is nowhere, compared with a wild hog, and when wounded, they are as ugly as a bear, although, fortunately, far more easily killed; but to return, the underbrush was so dense—three feet above the ground—as to defy progress, but below that it was comparatively free; so I dropped down and worked forward on my stomach. I had nearly reached the bottom, and was saying to myself that my labor was in vain, when something jumped from a bush, fifteen feet in front, and plunged into the thick *chaparral* above, without giving me a chance for a shot. I crawled to where he had been lying, and saw his tracks in the moist earth, that he had scraped up to make a cool bed, and bunches of his hair on the bush, against which he had rubbed. I remember thinking that I had but three cartridges in the magazine of my Henry, and stories of grizzlies making off with a dozen balls flitted through my mind. However, I got out of that cañon, and invited him out, but he wouldn't come, and I didn't feel like going in after him. Nothing pleases a bear more than to fall in with a dozen of hogs; they are fleet, and make the best of it; but he is fleeter, and one of them is sure to make his lordship a meal. He takes but one, and him he skins as neatly as a butcher would do, leaving the hide in a compact roll, with the head in the centre. As an illustration of his strength, I will say that I once saw a medium-sized native cow, dragged ten rods from the place where killed, and hidden in a clump of *manzanita*, and of his agility, that when thin and in running order, he will run down an ordinary horse. Apropos, is an adventure of an acquaintance of mine. Deer-hunting one day, his steps led him to the bottom of a gloomy cañon, and there, sunning himself, in a glade, lay a baby grizzly; he picked it up, and putting it into the bosom of his shirt, made tracks for camp. It was a long way off, and before he had made half the distance, he heard the stones rolling down the hill-side behind him, and the angry snort of the pursuing mother. He didn't wait for returns from the back counties, but dropping cub and rifle in his haste, swung himself into the nearest tree. The bear tore his rifle to pieces, gnawed the tree quarter off, and did not leave him until the next morning. He says, he don't like grizzly cubs any more. Almost like this was an accident that happened B., a young man from the "States," with a complete shooting outfit, and all the patents added. He was a fair shot and a good fellow, but was a little *off* on large game. At last he got a jumping shot at an old prong-horned buck, and as he fell, sprang forward to cut his throat, dropping his rifle in his excitement. At the first touch of the knife there was a transformation scene, and when our hero came came to his senses, he found himself up a tree, his gorgeous hunting suit in a dilapidated condition, and the buck standing triumphant below. He finally went off, and D. shot him, finding that his first ball had grazed the skull. I will remember that I did the self-same thing with my first deer, but, fortunately, my ball had broken his neck.

Antelope are not plenty, but roving bands are often met with, and afford capital sport. I once had a curious encounter with one in the San Joaquin Valley. I suddenly came upon a female, lying under a bank, who, instead of running away as usual, made directly for my horse, running around him, and gradually narrowing her circles, until I could almost touch her with my hand; then she would stop, stamp, lower her head, and charge a few footsteps. I would not shoot her, knowing she had a young one near, but reached for my lasso, thinking to take them to the ranche, but found the *tientos* broken, and it gone. I watched her play some time, and then rode on, and saw her gallop off and join her fawn, hidden near by.

While I am on the subject of the San Joaquin, let me tell how a representative of a prominent New York paper was taken in by stage driver, from Modesto up to the valley. It was just after the completion of the Pacific Railroad, and he was on a tour of observation through the State of California. It was winter, and the geese were dying thick; the morning he left Modesto was very foggy, and, in consequence, the birds flew low. He had the seat of honor, beside the driver, who, holding the reins of his light mustangs in his left hand, was playing with his long whip. One of his leaders did not work to suit him, and, as he swung his whip back, with a motion peculiar to the profession, to chastise him, it so happened that the lash wound around the neck of one of a flock of geese, and was pulled in, by John before it had time to slack, and thrust (the goose) beneath the capacious boot. The young man stared, but the driver rode on in silence. At last the sun rose from behind the Sierras, driving the fog banks back, until all was clear. John wrapped the lash around his hand, and, with a pensive sigh, remarked: "Shan't get no more this mornin'." "What!" said our friend, "you don't mean to tell me you did it on purpose?" "*A prepos!* in Eastern paper came with a letter from "Our Special Correspondent," detailing the goose story as fact.

The thick bark of the oak trees, in the parks I have mentioned, is perforated, by the woodpecker's in quest of insects, with numberless holes; into these the squirrels and gophers put acorns, to keep until time of scarcity. When that time comes, many and fierce are the battles between the owners and the blue jays. Tradition says, the birds themselves make the holes for the express purpose of making storehouses of them, but I incline to the first solution.

The coyote, that jackal of California, abounds, and many are the tales told of his cunning. Following are a couple, which, however, I do not vouch for: Some bright, moonlight night, master wolf, on his rounds, spies a turkey roosting, in fancied security, in the branches of a tree. He barks to attract her attention, and then runs slowly around her; his innocent victim, after the manner of her kind, follows his movements with her eye, and also, unfortunately, with her head. Soon dizziness overcomes her, and she falls from her perch, and the coyote, over her bones, reflects on the foolishness of turkeys. Again, he spies a flock of sheep, guarded by shepherd and dogs. Calling upon a few companions to aid him, they wait until the keeper is drowsing under the mid-day sun, allow the flock to wander away from them: the wolves rush in from all sides, and circle around the flock, whose weaker members are soon stamped under foot by their terrified companions. They then allow them to disperse, tear open the throats of the maimed, and lap their blood, and, by the time the shepherd awakes, are off.

Wild cats are numerous, and, in time of famine, bold, preying upon the *rancheros'* sheep and sucking pigs; they haunt the borders of streams, feeding upon quail, and smaller birds, stranded fish, and offal, indiscriminately. They are hunted with dogs, treed, and shot, or shaken out for the dogs to kill. I have also seen them lassoed from trees, where they had taken refuge. They are cowardly brutes, as are their cousins, the California lions, so-called, identical with the Eastern panther, although, I think, a little larger. These, when very hungry, will attack man; but, always from behind, or springing on him from a tree; never, as does that king of all American brutes, face to face.

I shot my first California deer within sight of the house—made a snap shot at him, as he cleared a space between two trees, and tumbled him. In the early morning the bare hill tops are favorite haunts for them, where they congregate to catch the first rays of the sun, for no matter how warm the days, the nights are always chilly. One of our party, on one of these hills, one morning, saw a deer killing a rattlesnake; something I have never seen, but often heard of. He was attracted by the actions of a buck and two does, who, unconscious of his presence, were intently watching something on the ground before them. The buck was running in short circles, his hair on end, horns laid back, evidently in a great rage. Suddenly he backed off, made a short run, sprang into the air, and struck the ground with his feet all together. These actions he repeated several times, and when my friend examined the ground, he found the remains of a large snake, its head literally severed from its body by the sharp hoofs of its antagonist.

Hogs wage a deadly war against these snakes in particular, and all in general, and apparently pay no attention to its bite, or its effects; at least, I never heard of a hog being killed by one, and I know that ranchmen often keep domestic hogs for the express purpose of clearing the neighborhood of these dangerous pests. By the way, let me give a receipt for snake-bite, which I have used on animals without a failure, and have known to cure men. It is very simple, consisting of pulverized ammonia, moistened to a thick paste with alcohol. Apply externally, and give a weak solution internally. If the fang has not struck an artery, or a large vein, it will cure; if it has, I advise the victim, if a human, to make his peace with God, and drink all the whiskey he can hold. He *may* live, but it is extremely

doubtful. The Digger Indians bury the patient neck deep, in river mud.

I have already wearied your readers, and will bring this lastily written letter to a close, only saying, that if a brother sportsman be dyspeptic, he will cure himself by joining the *vaqueros* on the plains, and with a good mustang under him, take their wild delights. If he be weary in body or mind, let him shoulder his rifle, and sojourn awhile in the Coast Range, and when he returns again to the haunts that knew him, he will often let his mind revert with pleasure to the days and nights passed among the hills. For Forest and Stream.

MY FIRST DEER;

OR, TWO DAYS' HUNT AT BRANDY POND, ME.

ABOUT the first of November found me at North Milford, where I had gone for a month's sport, also to recruit my health. I stopped, "and was at home," at Mr. James Fothergill's, Jr., who, I may say, is an experienced hunter, fisherman, and canoist, and who was my companion and guide in most of my hunts. Mr. Fothergill is pleasantly situated, for one so far back in the country, and he and his son take pleasure and pains with any parties who may be fortunate enough to secure their services. He has been guide and hunter some eighteen or twenty years.

The first few weeks I was enjoying myself about the woods and streams, gunning and trapping. Grouse were plenty, but the dense woods and swamps made it very difficult shooting on the wing, yet I managed to get several fine shots over my pointer. While out after game, we saw several times recent "signs" of deer, and my guide said to me, "the first deep snow that comes, so we can use snowshoes, we will have a good deer hunt." In less than a week we had a heavy fall of snow, and as it cleared up, James said to me one morning, "Charlie, I suppose you would like to kill a deer, would'nt you?" Nothing suited me better; so making arrangements, and packing up, we started for a couple day's hunt at Brandy Pond, about twenty miles distant. Our kit consisted of, first, our guns, a Romsdell rifle and my Parker breech-loader, and a good sized hand-sled. Then strapping on our snow-shoes, spreads, ax, cooking utensils (tea kettle, fry pan, plates, slippers, knives, spoons, and forks), with sufficient grub for three days, we took an early start, and having a very good road most of the way, we arrived at our stopping place (an old lumbering camp at the head of the lake) about 11 o'clock. Building a roaring fire, and after a hearty meal, we stretched out for a good smoke and a couple hours' rest. About 2 o'clock James said to me, "Well, my boy, do you feel like trying the deer this afternoon? Here we are right in the deer country, and, what is fortunate for us, they are close at hand." Although we had traveled nearly twenty miles, and, I must confess, I was somewhat tired, yet, the idea of deer being about us put new life in me, and I was eager to get away. As I could use snow-shoes quite well, and as the snow was deep, and good snow-shoeing, we did not anticipate a very hard hunt.

James knowing the country well, we struck out for the "Big Buffalo," about one and a half miles distant, and in less than a half an hour we had found a deer yard. Following it up, James pointed to a fresh track in the yard, and says to me, "Now, Charlie, look sharp and go easy, for they are right here.

Big Buffalo empties into Brandy stream, which is an outlet of the lake, and a branch of Union River. A little ways further on we saw where they had started, and deep as the snow was, the leaps those deer made was ten, twelve, and fifteen feet apart. "They can't do that long," said James, "so we will go easy and let them run it out." After trailing them for half an hour, one old fellow, probably the leader, turned one side and struck out for himself. Thinking that he was getting a little tired, and that I should soon come up to him, I followed after his track as fast as I could make my way through the brush. Following him some fifteen minutes, I found he was making for the stream, which was open in several places, and I expected he was making for the open water. But, on arriving at the stream, I was surprised to find that he had run down aways, and then turned and was coming directly back in the same tracks. Seeing me, he turned and crossed to the other side, and made through the woods toward the lake, that was about a mile distant. On I went, "pluck well up, and considerably excited," for this was my first deer, and I knew I should get him, sooner or later, and my ambition was to get him alive. I could have shot him as he crossed the stream, but felt more like "giving him a chance," as my companion had told me he would give up and fight it out. Coming out to the lake, I saw the fine fellow out on the hard snow resting himself. There he had the advantage, as the snow was hard and gave him a good chance to run, yet he did not improve it, as I expected. Taking off my snow-shoes, I tried to head him off, and again run him into the deep snow; but he was wise enough to keep the lake, so I drove him directly across the head of the lake, and, fortunate for me, in a line of our camp. Running him into a lagoon, I drove him up the bank, and once more into the deep snow, then putting on my snow-shoes, which I had carried under my arm, I once again started for him. Now, old fellow, thought I, you are my deer. I was within seventy-five yards of him, and could see that he was pretty well tuckered (like myself). In less than fifteen minutes I had him—but not without a struggle. Jumping, and making tremendous leaps, he went about seventy-five rods, then stopped, and faced me. As I come up to him, I saw, as I imagined, that he was an old buck and meant to fight. My companion had previously told me, that by jumping onto him, I could easily get him down, and once down, 'twas an easy matter to handle him. I remembered this as though it had just been told me; so getting as near as I dared, I made a jump at his head, but the old fellow was so much quicker than I, even in the deep snow, that he reared on his hind-legs, and bringing his front-legs and hoofs onto me, knocked me over, and easily got away; running about two rods, he turned and again faced me. Getting up to him, and a little to one side, I jumped onto his shoulder, grabbing him by the ear and one front-leg, I managed to get him down, but my snow-shoes being so clumsy, "and he not liking to have that ear fooled with," he got away the second time. Just about then I felt like putting a charge of buck-shot through him. Running about a rod, he again stopped and faced me. Picking myself up, and feeling a little "riled," I made for him again. Now, my fine fellow, said I, no more fooling; its either you or I. I again faced him, and jumped directly at his head, grabbed him by the nose and one front-leg, and with the strength I had (and I felt pretty strong just then) I managed by a sudden jerk of his head, to turn him over, then getting straddle of him, I got his hind and fore-leg together, and had him fast. Next thing was, how was I going to get him to camp—I was alone and nearly a mile from camp, and had nothing to tie my deer with.

Was I tired? I had only traveled a little over twenty-five miles that day, and run that old buck nearly three miles through swamps and across the lake. Thinking that James might be within hearing, I called and hallooed until I was hoarse, but no reply. As I was wet with perspiration, I did not dare to remain long, especially in the uncomfortable position I was in. Suddenly a thought struck me; I could take the thongs off from my snow-shoes and tie the deer's legs together; no sooner thought of than I was at work. As the leather thongs were strong and about a yard long, they answered the purpose well. Then taking off my Cardigan jacket, I brought both fore and hind-legs together, and tied them securely. Seeing that my game was safe for the present, I started, in my shirt sleeves, and with my snow-shoes under my arm, and made tracks for camp. As I got on the lake, I met James coming after me.

"What's up now, Charlie? where's your coat, and what's the matter with your snow-shoes?" As I was chilled through, and in a hurry to get back to camp for my over-coat, I did not stop long to give the particulars, but told him I had caught that deer, and had him tied, ready for camp. So starting back, we reached camp, and after a cup of hot tea and a lunch, we started back with ropes and hand-sled for our game.

It was but short work to get the deer on the sled and back to camp. Then came the particulars of the chase after I had left James, and a hearty laugh, on the part of my companion, at my getting "histed" by that buck deer.

Next morning we took an early start, and arriving at the "yard," and where the other two deer had kept on, we once more commenced our hunt. Before 1 o'clock, we had both deer, which made three large bucks in less than a day's hunting. Getting our sled, we got these two bucks to camp, and felt well paid for our hard tramp, by having killed two three-year-old bucks, and captured one four-year-old buck alive. Getting a horse and sled from a neighboring farmer, we hauled our game and luggage back home, and though somewhat stiff in the legs, and pretty well tired out, yet we felt satisfied with our hunt, and I well pleased at having caught, alone, my first deer. CHAS. E. WOODS.

North Milford, Me., November 29, 1876.

THE KANKAKEE MARSHES.

IN 1875 I followed the advice of older and would-be-wiser heads, and obeyed the popular cry, "Go West, young man;" and having already been West of the Rocky Mountains and enjoyed many a merry camping and hunting frolic in California, and having friends in Indiana with whom in more prosperous days I had been on terms of boyhood intimacy, I bent my steps from New York City in that direction, not now only in pursuit of pleasure, but of that very necessary essential to happiness—occupation—it being at the commencement of the wide-spread and prolonged panic in all kinds of business ventures. I was not long in finding out my mistake and vain hope of success, and I would here say—young man, let no delusive hope beguile you into obeying the cry—"Go West," but rather dig and delve in scenes with which you are familiar, where fond and loving hands *can* administer to your necessities, and where there is a field for your energies of man's invention, and not that alone of nature's own.

But I forget; it is 1875, and I am already in the West and with my friends, three brothers, with a widowed mother. Our meeting was both sad and joyous, as each had by death been deprived of a loving link, the helm that was to have guided us to a haven of prosperity. We talked of the past, when life with dazzling promises was just opening to us, of our later experiences in the rebellion, in which two of us had borne our part in the federal forces, and of all our hopes and fears for the present and the future; but of this we soon wearied, and our efforts for employment proving fruitless, a proposition that we make up a camping party met with a ready response. Our first study being economy, combining some degree of comfort, the next in order was a congenial party. This being accomplished, and the geography of the country examined, we found all things favorable to the Kankakee River or swamp, which was easy of access, and by inquiry we learned that game and fish did there abound; so this we decided should be our happy camping-ground. And now we must arrange for the kind of habitation best suited to our purpose. A board-house being given the preference over a tent (though some contending that it would seem too much like home life), we proceeded to put our plans into execution. Our lumber purchased, it, with stove, camp chairs, bedding, cooking utensils, boats, and provisions, we saw carefully stowed away in a freight-car, which left our point of debarkation at 11 o'clock A. M., arriving at Kankakee bridge at 6 P. M. On the 3d of October a party of five, Capt. H., the three C. brothers, and myself, might have been seen with our guns, dogs, high boots, and baggage innumerable, embarking on the Louisville, New Albany and Chicago R. R., on pleasure bent; and here let me say, we found the Road employes courteous, polite, and accommodating. Arriving at the Kankakee bridge in about four hours, there we met Capt. S., of the Crawfordsville Club House, who kindly invited us to take up our quarters with him for the night, dogs, guns, and all, which we accepted, being willing for that night to realize the sweet visions of home in a good bed at a comfortable house. This bridge is crossed by the L. N. A. and C. R. R.; there are four club houses at this place, Crawfordsville, West, Williamson, and Hayden, and in the shooting season there will be from twenty to thirty hunters stopping at these houses, who make it pretty lively for the birds. As a general thing they (each member) have their own boat, decoys, etc. This point is about ten miles from English Lake (another point of interest, but of this further on) by river, and half that distance by across-country. We were astir early, and after selecting our ground, which was a high point of elevation under two towering oaks and sloping banks on the Kankakee River, and getting our lumber, we all went to work with a will that would have done credit to a more remunerative purpose, and by night we had a habitation; yes, and furnished, not with rosewood bedstead, but with bunks and beds made of prairie hay, and now our guns on their respective pegs and a place made for "Chick," a red Irish settler, and "Shot," a liver colored pointer, and the stove already blazing away doing its share of the work, and we already to partake of its labor, sat down to our first camp meal, after which and our pipe of peace we retired to sleep the sleep of the weary. We awoke with the early dawn to make more improvements on our house, and ourselves familiar with our surroundings and prospects. It was about a week before we were ready to receive company (the friendly trapper) who were often enticed there by the novel appearance of our palatial mansion, while on their way up and down the river from English Lake, a small station on the Pittsburgh and Chicago R. R. There are two good hotels at this place for the accommodation of hunters and their families who come here from the prominent cities on the line of this road. The duck shooting at this point is good in the spring and fall. The hotels furnish boats, decoys, and a pusher, a man who pushes the boat, for which you pay, board $2.00 a day, a boat pusher and decoys, $3 a day extra. Their boats are made double bowed, flat bottom, very wide, and can go anywhere, from two inches to a fathom of water. Our household arrangements completed, and some of our party out fishing with trolling line and pole, and as the day and wind are favorable they will doubtless have good luck; but what have we been doing, but prospecting and making ourselves known to friend and foe. We have been up to English Lake and visited our friends at the Bridge, and now it is time to commence business operations; it is only an hour to sundown, and we have just discovered that the land on the opposite side of the river has been overflown, and our practiced eyes discover traces of woodcock. "What do you say, Frank, to our trying our little game for an hour before dark over there, and see if we can put any up. We will leave L. to look out for camp and finish his letter to the only one he ever loved." We loaded half a dozen shells with No. 10 shot apiece, and with dogs in boat pushed over. We no sooner landed than the dogs came to a stand. While Chick, the youth, was a little too fresh, and flushed his bird before we could get out of the boat. Steady, steady, Chick—come in here and down charge. Well done, Shot, I'll have to walk this bird up; he will stand here until doomsday if I don't go in ahead of him and flush it. Up he got, and I let him have the left barrel, which dropped him. Dead bird, Shot; dead bird, good dog. Frank, you look out for Chick, and take that thicket at the left, while I strike out to the right. I heard Frank talking to his dog. We could not work them together, as we had not the time before dark, and we wanted birds for our supper. We managed to bay in less than an hour three brace, I having missed two and Frank one, all we raised; and, our appetites sharpened, we returned to the wickie to cook them; and such a supper! woodcock (not on toast), fried potatoes, coffee, biscuit, which, Frank said, if there was anything he could make it is biscuit, which tasted pretty good I'll admit; and we did not know the merits of the oven; it baked like a charm, and we immediately christened it (the lively baker). Captain and J. arrived with four black bass, averaging four pounds apiece, and a salmon, which I afterward learned was the name, but at the time called pickerel, and are considered the gamest fish in the river. We finished our supper, and of course the "Durham" followed, and sat down to a game of whist, after which we loaded our shells, preparatory to the morrow's tramp, which we intended to take, having heard from Hunt, our neighbor, that about a mile west of us was a slough, and that he had never failed to see ducks there. We retired early that we might be up with the early bird. After partaking of our morning meal, and each one providing himself with a lunch, we headed for the "slough." We had no difficulty in finding it, as it covers about a mile square and is covered with wild rice. Frank and I separated from our party, and were walking through the rice in about two inches of water and six of mud, when we stumbled upon a small pond, when, quack, quack, from about two hundred mallards were heard; up they got, and we let them have four barrels. We picked up nine, taking our stand at this place, and keeping the dogs "Down charge," and ourselves out of sight, thinking they might wheel and come back, as this was evidently a favorite feeding ground of theirs. We had not been long in our blinds, when they commenced to come in by twos and threes, and I tell you it was like the 4th of July there for a time. We heard occasional shots from the other party, but were too busy with our own sport to know anything but ducks. We shot there until dark, and with the help of the dogs, bagged forty-five mallards, and returned to camp the best way we could, with our loads, to find the others had also made a good day of it, the three having brought in twenty-five, making our total bagged seventy; pretty good for a starter, I thought. Of course, Frank and I had the cream of the shooting. We all devoted our time mostly to ducking, with an occasional change to hook and line, but we never got up to our original number on ducks, averaging only about thirty a day. The woodcock we tried again, but found them few and far between. And for the benefit of those contemplating a trip there, let me say, that by all means take your own boats and camping utensils, and camp out; and go in the month of March, or now, if you go for ducks. If you stop at English Lake, do not fail to see Dr. Geo. Yeakel, who will be pleased to give you all needed information, and whose latch-strings are as long as he is. C.

Furs, Skins and Pelts.

INDIAN TANNED SKINS.

HIDALGO, Texas, March 12, 1877.

EDITOR FOREST AND STREAM.

In your issue of February 22d, you quote instructions for curing skins, and allude to the Indian method. Though no secret here, it may be new and interesting elsewhere.

The skin is stretched either on the ground or on poles, and all fat or flesh removed. When well dried it is washed in soap and water to cleanse the fur; the brains of any animal are then taken and mashed into a paste with hot water, and this paste is thoroughly rubbed into the flesh side, and the skin hung out to dry. When dry it is scraped, and exposed to the dew for one night, and next morning rubbed and pulled until soft.

Buckskins are made by rubbing off the hair with a horse-rib, while the skin is fresh, or, after soaking in a weak lye; then dressing with brains, and staining a reddish color in a decoction of Wasatchie bark. Alum and salt are very good, but alum is rather scarce in the chapparal, and also are doors and boards. Some stretch skins on the ground.

Care should be taken, by the way, not to use too much salt, as advised by "The Ploughman," as it causes the skin afterward to absorb moisture too readily. Smoking a skin is done by first dressing with brains, sewing it up into a funnel-shape, and suspending over a slow fire of buffalo chips, or dry prickly pear, built in a hole in the ground. The tips of the funnel being pinned down close around the hole; a clear, calm day, is selected, and the smoking requires about two hours. It gives a velvet-like finish, and the skin never shrinks or gets stiff from wetting, but washes like cloth. QUERO.

WHAT RELATION TO A BUTTERFLY IS A MILLER?—*Ans.* The miller makes the flour—the flour makes the hot-roll—the hot-roll makes the butter-fly.

—A great deal of this world's sympathy is much like standing on the bank, and asking the poor drowning man if he is wet.

Fish Culture.

ABSTRACT OF THE ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF PENNSYLVANIA.

The Commissioners report that the Inland Fisheries Restoration movement continues in Pennsylvania to be at least abreast of what it is in the other States of the Union, in which it has been inaugurated, and that the appropriation has been expended judiciously.

BLACK BASS.

The waters of the State being admirably adapted for the growth and increase of this fine fish, particular attention has been paid to it. The Susquehanna, from its mouth to the head waters of both the Juniatas, may now be said to be full of black bass. The same may also be said of both the West and North Branch for considerable distances above their confluences at Northumberland. The Delaware, from the head of tide water, along the whole State border, is equally supplied. Several of the Pennsylvania branches of the Delaware are filling by degrees, and soon both those great rivers may be said to have had one most admirable tribe of edible fishes added to their product. The black bass has also been introduced into the upper waters of the Conemaugh, west of the Allegheny Mountains, and is there increasing and multiplying in the same satisfactory manner which has been observed in the eastern streams. The present abundance of this fish more than repays all the expense the State has been at.

OTHER SPECIES.

The different species of fish to which the Commissioners have given attention comprise black bass salmon, brook trout, salmon trout, land-locked salmon, shad, and California salmon. While the fishermen have not shown alacrity in obeying the laws, which were made absolutely necessary by the deterioration of the fisheries, they will soon learn that they are for their own benefit, and even now a decided improvement is seen in the shad fisheries of the Susquehanna. Large numbers of shad have been artificially hatched, and turned into the waters of that river and the Delaware. As yet, the Commissioners are unable to judge whether their artificial hatching is a success or not. The fish turned out in 1873, should have reappeared in 1876, but that year the run was meagre, beyond precedent. Still, they are hopeful of success. The say, "the shad artificially hatched may have been destroyed by some sub-marine cause undiscoverable by us, or from some similar cause the reinforcement which we sent to the sea may have been prevented from returning in three years. But, if that be so, may they not return in the fourth year, in the fifth, the seventh, nay, later—judging from the heavy specimens which it was not at all uncommon to take yearly as the fishing seasons returned." The number of shad hatched by the Commissioners of New Jersey (Pennsylvania bearing half the expense), and deposited in the Delaware, at Block's Eddy, amounted to 1,400,000.

CALIFORNIA SALMON.

The California salmon placed in the streams by the Commissioners cannot be said to have yet returned. But here they are even more in the dark than they are in respect to the shad. The first placed in the Susquehanna were the first deposited in any of the Atlantic waters, having been presented to Pennsylvania by the United States Commissioner, Prof. Baird, being all that he had as yet received from the Pacific. Pennsylvania received the preference, because her streams seem to be more like those of the Pacific slope, in general characteristics of temperature, etc., and so the number on hand (but little exceeding six thousand) were placed in the Susquehanna, at Harrisburg, by Col. Worrall, in the early spring of 1873. The fourth season now approaches, and they hope to find them take their places among the migratory fishes of the Atlantic coast. Repeatedly since the deposits have been made, and year after year, strange, individual fishes, have been caught, sufficiently resembling what the fish ought to be, to show that these strangers must be stragglers of the deposits, which have made their way to the sea. Fishermen who have caught them, and who, in almost all instances, have returned them alive to the water, have said that they resembled brook trout more than anything else, and this is an extremely favorable evidence that the strange fishes are half grown Californians.

LAND-LOCKED TRIBES.

The Commissioners have endeavored to find some mode of hatching, artificially, the pike-perch, sometimes called the Susquehanna salmon, but without success. Special protection will have to be afforded these fish. Considerable numbers of salmon trout have been deposited in both the lakes and rivers of the State, from which most favorable accounts have been received. Attention has also been paid to the land-locked salmon, some thousands having been deposited in Harvey's Lake, Lucerne County, where, it is hoped they will succeed. The Commissioners are negotiating for an invoice of grass bass (*Centrachus Hexacanthus*), a fish which has, as yet, received but little attention at the hands of fish culturists. It is said to be an excellent pan fish, possessed of great endurance and strength, and, above all, a fish which lives harmoniously with all other species; not predatory itself, and protected from attack by its formidable dorsal and abdominal fins.

PENNSYLVANIA WATER-SHED.

The Commissioners devote considerable space to a description of the water system of the State, the whole drainage reaching the sea by but four outlets; namely: Hampton Roads, Delaware Bay, Gulf of St. Lawrence, and Gulf of Mexico, and these are, therefore, essentially but four different streams, let the branches of those streams number what they may. This shows, that the physical geography of Pennsylvania is admirably arranged for the ultimate dissemination of fish throughout her borders. At a comparatively small expense, the process of filling the streams may be materially hastened.

HATCHING HOUSES.

The liberality of the State has amply provided for these. There has been established now, for nearly three years, a hatching house at Donegal Springs, near Mariette, in Lancaster County, from whence many millions of young fry have been sent forward to every part of the State, and since the present Legislature has commenced its sessions, hundreds of thousands of California salmon, salmon trout, and brook trout have been sent out or delivered to parties calling for them. The appropriation of last year was increased, so that a Western hatching-house should be established, on a suitable site, located west of the Allegheny Mountains, where abere would be a sufficient quantity of never failing water. The Commissioners finally came to the conclusion to purchase the establishment of Seth Weeks, near Corry, in Erie County. Mr. Weeks had, for several years, out of the brook leading from his springs, propagated many thousands of brook trout in a somewhat primitive manner, but successfully. The place place consists of nine and one-half acres of land, having thereon erected a good dwelling house, and every appurtenance and facility for prosecuting the undertaking. Add to its advantages, abundance of water, regularity of temperature, the appurtenances of dwelling-house, hatching-house ready stocked, the close vicinity of one of our most interesting piscatory regions, the waters of Lake Erie, and the choice cannot but be approved. The State has now two such establishments, and its operations will compare favorably with those of any State in the Union.

All Legislative enactments, the Commissioners complain, so far seem to have been successfully disregarded. Gill-netting, with all its injurious tendencies, ought to be regulated, if possible, both upon the Delaware and the Susquehanna. But, if it must still be allowed, let there be some restrictions short of absolute license; or, let the twenty-four hours of the Sabbath be made a close time, and, thus, incidentally, protect the interest of the upper riparian inhabitants. On this and kindred subjects there must be concurrent legislation between sister riparian States—say New York, New Jersey, Delaware, and Maryland—and should any anadromous fish succeed in the Ohio, then with West Virginia, Ohio, and other of the Western States.

The pollution of streams is fully discussed in the Report, and it is claimed that the deposition of deleterious liquids and substances of various natures, in streams from mining and manufacturing establishments of many kinds, must also be regulated. The purity of the water can be preserved without unduly restricting parties pursuing legitimate occupations, but carelessness should be punished. With regard to fish-ways, the Commissioners say, "The plan we have adopted is a gentle, inclined plane, sixty feet wide, through which, when the water is just flowing over the dam, a stream passes three feet wide, at a rate not exceeding eight miles per hour—against such a current a boat can be polled; indeed, that has actually been done through our fish-way, and yet the fisheries above the dam are not resuscitated. True, we catch fish (shad) above the dam yearly; even last year (1876), when the run of shad in the Susquehanna was very much below the average, some five or six hundred shad were caught many miles above our fish-way. But this is not a satisfactory result; we want the old fishing grounds brought back to the old activeness; we want thousands caught at every old battery. Our fish-way does more for shad than any or all other fish-ways, but the *status quo* existing before the dams were built, is not yet returned." The crooked fish-way which salmon will ascend, they claim, is but suitable for shad, as, instead of going by platoons, or in single file, the latter fish move gregariously, like sheep, and, if the leader takes a sluice or a rapid, he is followed by the school, and they all make a simultaneous rush and pass through. But the leader will hesitate at the slightest obstacle—will stop and tremble at a shadow; for instance, the shadow of a bridge span. It has been sometimes thought that they got their name (shadow-fish) from that circumstance, and if the shadow scares the leader away, they dart again to the rear of the whole flock or school, and nets which they escaped before are extremely likely to take the panic-stricken crowd on the rebound, as it were. The plan, therefore, is recommended as being the simplest. But now, they say, comes in the difficulty; no law which has yet been passed seems to be efficient to keep the fishermen about the dam from fishing immediately in front of and around our fish-way continuously, during the whole fishing season. And, instead of wondering why the fish do not ascend our fish-way, it seems difficult to imagine how a single shad can pass it, beset, as it is, by these deliers of the law, uninterruptedly and continuously, day in and day out, night in and night out, from the very first to the very last run of shad in the season. But Pennsylvania has always been supposed, at any rate, to be a community observant of the law, and however the laws have been got around, however they may been evaded, the time must come at which we shall reach a mode of expression which will preclude all chance of evasion—a mode of execution which will terrorize the marauders.

"The restoration movement, then, may be said to be fairly progressive. The States around us are all engaged with us in trying to forward it. We must co-operate with them; we must have concurrent legislation with the co-riparians, and when that is offered, let it not be opposed by men, who, mistaking their own interests, oppose the movements intended for the benefit of all."

The Report closes with further suggestions regarding legislation, and a copious appendix, detailing the operations of the Commission in depositing the various kinds of fish, and giving the numbers placed in each body of water.

WHO FIRST INTRODUCED BASS INTO THE POTOMAC.

LETTER FROM W. W. SHRIVER, OF WHEELING.

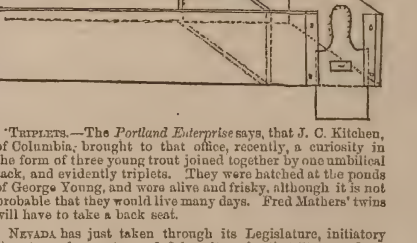
As many of our readers are aware, the question as to how and by whom our Ohio river bass were first introduced into the Potomac is not a new one, and the enterprise has been at various times credited various persons. It seems that in the Valley of Virginia, and at the other points east, considerable interest is still felt on the subject, as the bass fishery in that river is a matter of no small moment to many persons, not only to amateur fishermen, but also to many persons who get their supplies of fish from the Potomac. And, therefore, it is an item of curiosity to all such persons to know for a fact just how the bass were first introduced. This feeling on the subject accounts for a letter lately written by Dr. Wall, of the Valley of Virginia, to General Shriver, of this city, making inquiries of the latter as to what he knew upon the subject. The following is the General's reply:

WHEELING, West Virginia, September 17th, 1867.

DR. A. WALL—*Dear Sir:* Your official communication of the 1st inst., on the subject of transferring the black bass of the Ohio to the Potomac river, came duly to hand, and I herewith send you a printed slip having an extract of a letter I wrote to Philip T. Tyson, of Baltimore, Agricultural Chemist of Maryland, in reply to his letter to me of Sept. 4th, 1860, upon this same subject, which I hope will give the desired information. The number of these black bass taken to the Potomac by me, as well as I can now recollect, was about thirty. The writer of this is undoubtedly the individual and the only person who adh ever anything to do with the transfer of those fish to the Potomac.

Very respectfully,
W. W. SHRIVER.

The following is the extract referred to:



"I have received to-day your very interesting communication of the 10th inst., upon the subject of an experiment made by me some six years since of transferring some of the several varieties of our finest game fish of the Ohio River to the head waters of the Potomac at the town of Cumberland, in Alleghany County, Maryland.

"The enterprise or experiment was contemplated by me long before the completion of the Baltimore & Ohio Railroad to the Ohio River at Wheeling, but no satisfactory mode of transportation presented itself to my mind until the completion of that great work (in I believe the year 1853), and in the following year I made my first trip (although I made several afterwards in the same year), carrying with me my first lot of fish in a large tin bucket, perforated, and which I made to fit the opening in the water tank attached to the locomotive, which was supplied with fresh water at the regular water stations along the line of the road, and thereby succeeded well in keeping the fish (which were young and small, having been selected for the purpose) alive, fresh, and sound.

"This lot of fish, as well as every subsequent one, on my arrival at Cumberland, were put in the basin of the Chesapeake & Ohio Canal, from which they had free egress and ingress to the Potomac River and its tributaries, both above and below the dam; and although somewhat ridiculed at the time by some of the intelligent citizens of Cumberland, I am gratified to learn from others as well as yourself, that in this, my first piscatorial experiment, the object of which was to supply the waters of the Potomac with some as fine varieties of game fish, both in size and quality, as ever inhabited the fresh water streams of any country, has been crowned with complete success, and I feel that I am fully compensated in this for all the time, trouble, and expense I have bestowed on the subject.

"I will add one singular fact in this connection, which is that there is not known to exist in any streams (as far as I have been able to learn) east of the Alleghany Mountains, from the Falls of Niagara in the north, to the Gulf of Mexico in the south, these varieties of game fish, while they exist in every stream west of the Alleghany, and in every lake and stream west of the Falls of Niagara, and as far south as the Gulf of Mexico."—*Wheeling (Va.) Intelligencer, Oct. 6th*, 1871.

FLOOD-GATE FOR HATCHING TROUGH.—Appended is a sketch of a flood-gate to be used on a fish-hatching trough. The design of the gate is to raise or lower the depth of the water in the trough at pleasure. It saves a good deal of labor in the way of dams. The gate has been in operation in the Virginia Fish Hatchery during the present season, and has given a great deal of satisfaction.

TRIPLETS.—The *Portland Enterprise* says, that J. C. Kitchen, of Columbia, brought to that office, recently, a curiosity in the form of three young trout joined together by one umbilical sack, and evidently triplets. They were hatched at the ponds of George Young, and were alive and frisky, although it is not probable that they would live many days. Fred Mathers' twins will have to take a back seat.

NEVADA has just taken through its Legislature, initiatory steps toward a system of fish culture in that State, and appointed Mr. Parker State Fish Commissioner.

"The Fish Commission of Vermont, with Dr. Goldsmith at their head, are proving successful with some most interesting experiments. Among the rest they have transplanted the smelt from the salt water to the fresh waters of the State without diminishing their fecundity, and with improvement in their quality. The fresh-water smelt, indeed, as raised by Dr. Goldsmith, is the aristocrat of his race. Herring have also been transplanted into some of the larger and deeper Vermont lakes, mainly to serve as food to the lake trout and pickerel."

Natural History.

OUR MOCKING-BIRD.

BY MRS. MARY TREAT.

OUR Mocking-bird owns a home and a tract of land. Like any other land-holder, he is supreme ruler over his own dominions, and no other bird is allowed here except such as he permits. Several mocking-birds of my acquaintance are real-estate owners; but, I think, all do not have the ambition to own landed property.

The hero of my sketch lives in a small cypress, just in front of the cottage where I reside. This cypress is covered by a native grape-vine, forming a complete dome, and a pretty bower beneath. His territory embraces a hedge of Spanish bayonets, which extends along the front of the the cottage; he also includes the piazza and its immediate vicinity as his property.

The Spanish bayonet bears a large, sweet fruit, about the size of a banana, which grow in a great cluster at the top of the plant, of which the mocking-bird is very fond; and this hedge bears fruit enough for all the birds of the neighborhood, yet this wealthy proprietor will not allow any bird, whether large or small, to partake of his fruit; and such a time as he has, guarding it! He can hardly find time to bathe and dress his feathers. But I suppose that he could not be convinced that he would be happier and more free with less property to look after.

One day, I thought I would regulate things, so that the other birds might have a share; so I took some of the fruit from the hedge and hung it upon some orange trees close by, where I could watch proceedings. But it was no use; the fruit is within his dominions, and he guards it just as jealously as he does the hedge—in fact, he prefers this that I hung upon the trees, as it gives him a better place to stand while he eats. At one end of the piazza is a large branch of holly, very full of bright-red clusters of berries. The branch is placed in a jar of water, to keep it fresh, and the long gray moss, which hangs on the trees here, is also used to help decorate and screen the end of the piazza. Our mocking-bird also claims this holly bush, and comes and eats the berries, while we are sitting on the piazza.

He is very observing; he knows just as well as I do what birds he can trust within his dominions. Every morning I scatter a plateful of cracker-crumbs and oats near the piazza, a large number of birds coming regularly for their food. Now, the mocking-bird does not care much for crumbs or oats, as he is perfectly willing that the birds should eat there, if they will only let his fruit alone; and many of the birds that eat the crumbs and grain do not care for his fruit, and these he will allow all about him. I suppose he considers them honest, respectable citizens.

Many of the birds that I feed are migratory, coming to Florida in the fall, and returning in the spring. Among them are several kinds of sparrows, and the little Maryland yellow-throat. This charming, sprightly, little bird is less in size than a chipping sparrow. Its general color is olive-green, but the throat is a bright yellow, and a jet-black band runs across the forehead, and extends down each side of the face, which gives it a quaint look, as if it wore large side-whiskers.

A large number of beautiful cheewinks have become quite tame; will come almost to my feet to pick up the crumbs. I have observed, however, that when I wear a gray dress, something like the color of the bark of the tree, and pull my hat down pretty well over my eyes, that the birds will come much nearer to me than when I do not take these precautions.

The blue jay also comes for a share of these crumbs, but he does not pick them up and eat them in the same manner that the other birds do; he looks around for the largest piece, and takes it and flies to a tree, and holds it against a branch with one foot, and breaks off small bits with his bill, and eats them in the same way that he does an acorn; and he is not satisfied with this, but he takes pieces and secrets them about the fence, and other places, and almost always when he comes to look for them they are gone—have been filched by the sparrows in his absence; and then, such a screaming as he sets up, I should think would frighten the little culprits, but they look as unconcerned and innocent, as if they knew nothing about the matter, so he has to content himself with the acorns he has stowed away, or picks up fresh ones from the ground.

The Carolina wren and the beautiful little ground dove also come for a share of the crumbs. The mocking-bird is on good terms, with all the birds I have mentioned, for they do not eat his fruit. But the lovely red, cardinal grosbeak, and his cousins, the thrushes, and even his own brothers, he will not allow to come near the hedge, nor to alight on either of his trees. And a charming, little green warbler, not as large as a sparrow, meets with no mercy, for this tiny creature likes the fruit, and, notwithstanding its small size, he drives it from his domain—singling it out from among the sparrows, and chasing it away—even when it is not eating his fruit. But the mocking-bird cannot always be on guard, for, like other epicures, he must have a variety of food; and, although he owns so much property, and is ruler over so many birds, yet he keeps no servant to supply his wants, and a large share of his food consists of various insects, which he must hunt for himself. And this tiny warbler has become very cunning; as soon as our imperious mocker leaves his home, the little warbler, who seems to have been watching and waiting his opportunity, now glides down from some tree, and eats in peace until he is satisfied.

Twice I have seen the mocking-bird make a mistake, and drive a bird that never touched his fruit. The first instance, was with a cheewink, which, certainly, was in a suspicious attitude, for I thought myself it was eating the fruit. Heretofore he had always trusted the cheewinks, and had let them come about him in his bower, and on his trees, but this time one alighted on a tree with something to eat—probably an insect—and happened to stand in such a position that he looked exactly as if he was eating the fruit. The mocking-bird was on his dome, where he could overlook all his property. He saw the cheewink, and acted as if he could hardly believe his own eyes; he turned his head first one way, and then the other, and peered at him very intently for a few moments; then he sailed down, and with a volley of scolding notes, drove the poor cheewink quite a distance; and, not satisfied with this, he returned and drove every one from the ground which were feeding about the piazza. Ever since this happened, he will not allow a cheewink to remain upon either of his trees, but I have not seen him drive them from the ground since the day he was in such a towering passion, but I suppose he can never be convinced that he was mistaken, and will never trust them as before.

The other occasion, a little yellow-rumped warbler alighted on the holly bush, at the end of the piazza, and was peering about among the moss for insects. Our mocker watched him awhile, and concluded it must be the berries that kept him there so long, so down he came, and drove him a long way off, and then returned to his home, and appeared as self-complacent and as much satisfied with himself as if it had been a bird of his own size that he had driven.

But, unlike most tyrants, he is very courageous; he will attack and drive a sparrow-hawk from the neighborhood, unaided by any other bird.

This hawk is elegat in his appearance, a trifle larger than the mocking-bird, and with his strong, hoked beak, he must prove a powerful adversary, if he should turn upon a bird weaker than himself.

A few feet from the mocking-bird's home a vane has been erected to show which way the wind blows; it towers above the tallest trees, and here a sparrow-hawk often alights. While I was sitting on the piazza, watching a flock of sparrows feeding close about me, this hawk came swooping down, and took one from right before my eyes. He caught it on the wing, just as it rose to fly; the other sparrows flattened themselves close to the ground, and remained perfectly still for a few moments. The hawk flew back to the vane with his prey, and now the mocking-bird, who had been a witness of the transaction, at once attacked him; but he was careful to keep behind, and strike him on the back, and this annoyed the hawk so much that he could not eat the sparrow, but he held it in his claws and growled at his persecutor for a while, and then flew away, the mocking-bird following, and hitting him on the back until they went out of sight.

With all his other entertainments, our mocker is a fine musical performer, and, unlike the songsters of the North, he sings at least ten months of the year. When we arrive in Florida, about the 1st of November, he greets us with his song, and acts as if he remembered us; but toward the last of this month his notes begin to lessen, and by the 1st of December he is quite silent; by the middle of January he commences again, at first in low whispers—so low that we can scarcely hear him; he seems to be rehearsing. He continues this for a week or more. There is something exquisitely beautiful about these low, tender strains, and during these rehearsals he always faces the piazza, and seems to be singing to us. Gradually his voice increases in volume, until, by the 1st of March, he is in full song. And now he leaves his home more frequently, and is gone longer—is neglecting his business—and the gay, cardinal bird takes advantage of his absence, and with furtive looks ventures to regale himself on the forbidden fruit.

This neglect of home and business continues for several days; at last he returns with a charming female, who inspects his bower with a critical eye, and seems pleased with all the surroundings; then she accompanies him to one of the trees, on which hangs the fruit. Now they both eat, standing side by side, and then return to the lower, and now on the topmost branch of his dome, this joyous bird proclaims his happiness in the most entrancing song, no longer facing us, but always facing and addressing his beautiful partner.

OSPREYS TAKING DEAD FISH.

EDITOR FOREST AND STREAM.

My question, asked in your columns, of January 11th, "If this incident occurred as related by S. C. C., was it not an unprecedented one?" was asked for information, as I had never heard of a similar occurrence. It is true that Audubon tells us of Ospreys taking the fish that had risen, dead or dying, to the surface of the water, in some of the lakes adjacent to the Mississippi River, where the water was too muddy for the hawks to discover them alive, and immense flocks of Wood Ibises were trampling the bottom, making it so difficult for the fishes to respire, that they were obliged to rise to the surface, and were then killed in great numbers; but he immediately adds, that "except in such places, and on such occasions," he had never observed the Fish Hawk to procure prey in any other than the usual way. I quote this high authority in answer to S. C. C.'s quotation from "Allen's Notes of Some of the Rare Birds of Massachusetts." At the conclusion of his article, in FOREST AND STREAM of February 8th, which reads, "one should not rashly question the accounts given by usually reliable authorities, because, in particular instances, they do not accord with their own observations." To relieve myself of the imputation of asking a question that was either egotistical or "rash," as it was not mentioned whether the incident related by S. C. C. occurred within thirty yards, or a thousand, of the observer, I suggested the possibility of a mistake, such as the closest observer may sometimes make. I once thought that I saw an Osprey take a dead fish from clear water, and it was by the merest chance that I discovered that I was deceived by exceedingly convincing appearances. I was on an island in the Gulf of Mexico, in search of ornithological specimens, and seeing an Osprey fishing near the shore, I concealed myself behind a sand-hill, to watch him while I rested to enjoy the cooling breeze ere plunging into the swamp again. At length, a fish was taken, and the bird flew with it directly toward me, until within six rods, when I fired, expecting to bring him down at that distance, although my gun was loaded with small shot; but with a scream, he turned and flew out over the water until about a hundred yards distant from me, when he dropped the fish. Then, to my surprise, he wheeled in the air, and darting down, rose again from the water, with, apparently, the same fish, and flew in over the beach. Seeing that I would not get a shot at him by remaining quiet, I ran quickly behind the sand-hills, in the direction of his flight, and as he passed over them, I discharged both barrels in quick succession, causing him to drop the fish, which I picked up and examined. It was of the same species and size as the one brought so near to me by the hawk in the first instance, and my companion, avowed that he caught sight of the first fish in the water after it was first dropped, and that it was belly up and dead. The incident was such a very unusual one, that I discussed it at some length, with my companion. We finally returned to the beach, to retrace our steps, and as we walked along, I noticed, at the water's edge, a dead fish, just washed ashore, which, on examination, proved by the marks of small shot and hawk's talons on it, to be the fish that our bird had dropped into the water, and which, but for thus accidently finding it, I should have certainly believed had been re-taken by the Osprey, although I had expressed to my companion my belief, that the fish must have had life enough to swim a little, or at least to make some life-like movement. The fact of an Osprey taking a fish immediately after being shot at, was paralleled in the interesting incident related by "Dom Pedro." Will he tell us if, on the second time, the fish taken was surely the one dropped? and if so, was it dead before being re-taken? My queries are not intended to be in the least in a critical spirit, but are prompted solely by a desire for knowlecge, believing that if observers would more frequently compare notes, and the columns of FOREST AND STREAM furnish an excellent medium for so doing, much valuable information might be dissominated.

I have seen white-headed eagles catch fish, although never "with the dash and grace of an Osprey," as I have seen related by same writer. On the contrary, the fish I refer to were eels, and caught in shoal water, after much flapping and dangling of legs, close to the surface of the water, by the eagles. I think eagles are by no means scarce in the Northern States, unless it be by comparison to their great numbers in some of the southernmost States, and in the spring and summer they are abundant in Maine and New Hampshire, where I have on many occasions observed the common incident, of the robbery of an Osprey of his prey by the white-headed eagle.

To mistake an Osprey for an eagle, at a distance, would by no means imply lack of knowledge or experience in observation of these birds, so similar in their flight, plumage, and size. Only last summer I had my attention called to a large bird soaring in circles, at each circuit revealing in the sunlight the white-head, which only the aid of a field-glass proved to be that of an Osprey and not an eagle. ROAMER.

THE BIRDS OF WEBSTER, NEW HAMPSHIRE, AND ADJOINING TOWNS.

BY CHARLES F. GOODHUE.

Continued from our issue of March 22d.

STRIGIDÆ—THE OWLS.

Otus Wilsonianus. Long-eared owl. Not common, except in the migrations; may breed, as I have seen it the middle of June.

Brachyotus Cassinii. Short-eared owl. Quite rare; have seen but one.

Syrnium nebulosum. Barred owl. Common resident; probably breeds.

Bubo virginianus. Great-horned owl. Common resident; the most common of the owls.

Scops asio. Mottled owl. Common resident; have seen more red birds than gray.

Nyctale acadica. Acadian owl. Not common; have taken one each winter for the last three years. It has the habit of taking up its residence in barns and out houses in winter, probably for the purpose of mousing.

Nyctea nivea. Snowy owl. Rare winter visitor from the north.

Surnia ulula. Hawk owl. Exceedingly rare; winter resident; have seen but two in four years.

FALCONIDÆ—EAGLES, FALCONS, AND HAWKS.

Haliætus leucocephalus. White-headed eagle. Rare; see but one or two in the course of a year.

Pandion carolinensis. Fish hawk. Common in the migrations.

Falco columbarius. Pigeon hawk. Not common; may breed, but have never met with the nest.

Falco sparverius. Sparrow hawk. Common in spring and fall; breeds. The only nest that has come under my notice, was placed in a hollow maple, about six feet from the ground; it contained six young.

Astur atricapillus. Goshawk—Blue hawk. Rare; perhaps less so in winter.

Accipiter Cooperii. Cooper's hawk. Common resident through the summer; may winter; breeds.

Accipiter fuscus. Sharp-shinned hawk. Common in summer; a few winter; breeds.

Buteo borealis. Red-tailed hawk. Common summer resident; a few remain through the winter; breeds.

Buteo lineatus. Red-tailed hawk. Resident; least abundant in winter; breeds.

Buteo pennsylvinicus. Broad-winged hawk. Rare; have seen but few specimens.

Archibuteo lagopus. Rough-legged hawk. Not very common; a few found in fall and winter.

Archibutes Sancti-Johannis. Black hawk. Rare; saw a fine specimen in the winter of 1875.

Circus hudsonicus. Marsh hawk. Common in summer; breeds, nesting on the ground,

COLUMBIDÆ—THE PIGEONS.

Ectopistes migratorius. Wild pigeon. Common summer resident; breeds. I think, as a general thing, that they lay but one egg, as I have found many nests, and there never was but more than one, with but one exception.

Zenædura carolinensis. Turtle dove. May occur, but have never met with it as yet.

[In our issue of March 1st, the White-throated Sparrow was referred to as *Tyndrichia leucophrys*, instead of *albicollis*, as it should have been printed. An error also occurs in the list of warblers, *Dendroica cerruleacens* having been spoken of as the Black-throated Warbler, instead of Black-throated, Blue. It will be observed that Mr. Goodhue separates the two forms of *Archibuteo*, instead of regarding them as different plumages of the same species.—ED.]

WHITEFISH OF THE OSWEGATCHIE.

CANTON, N. Y., March 20, 1877.

EDITOR FOREST AND STREAM.

I see in your correspondent's column, that J. B., of Montreal, speaks of whitefish being found in the Oswegatchie River. Once, early in July, nearly or quite ten years ago, at the mouth of a spring brook, known as the "old Indian fishing ground," some two miles below Cranberry Lake, we caught a fish that we called a whitefish—I suppose because we did not know what else to call it. They were letting off water from the reservoir, and the river was high, and the water foul. The mouth of the brook was crowded with trout, weighing from one-quarter to three pounds, and with these fish, which very much resemble a sucker in color and shape, only they were more silvery than the sucker. The mouth was much, but not quite the same. Neither they or the trout would "bite," and we "hooked up" enough for camp use during the two or three days we were there. Sometimes we got trout, sometimes "whitefish." The latter, when cooked, were very white, fat, and fine flavored. We pronounced these fully equal to the trout. They were free from all the loose bones found in the sucker. The same season they were found at two or three spring brooks some twenty miles below, on the river. I do not think we saw any over a pound in weight—most of them about one-half that. I do not know of any being caught there before or since.

Thinking it possible you might desire even the little information I could give on the subject, I took the liberty of writing. J. M. R.

THE CARP OF VIRGINIA.

BOSTON, March 16, 1877.

EDITOR FOREST AND STREAM.

Talking with a friend in relation to the introduction of carp into this country, as mentioned in two of the back numbers of your issue, he stated that in the year 1857, he was in Virginia, and, being an ardent lover of angling, tried his art one day in a pond, at the head of Moratico Creek, Lancaster County, at Ball's Mills, and caught six very large fish, weighing, in the aggregate, some thirty-seven pounds. They being an unknown fish to him, although he had fished in nearly all our States and Territories; they were shown to a great many persons in that vicinity, and none could give them a name, except a Dr. Ball, who said he was familiar with the fish in Europe, as *carp*, but had never before seen them in this country. Among the persons viewing the catch was an old negro, who said that, years ago, a Mr. Mitchell had brought that kind of fish from "away 'cross the sea," and put into the pond.

The publication of the above may bring out some further intelligence relating to this matter. D.

A COMPANION FOR THE "PIPE FISH."

WAREHAM, MASS., March 19, 1877.

EDITOR FOREST AND STREAM.

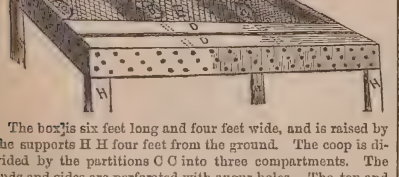
I this day mailed a package to your address, containing a well-grown oyster attached to the inner side of the bowl of a clay pipe, which, perhaps, it will be well for me to hand over to the New York Aquarium. The novelty was taken from an oyster bed a few days ago (in our river), and by examining the back-side of the bowl, there will be seen an indentation made by the tongs, by which it was taken from its resting place.

I was actuated in my interest in this specimen, by reading in FOREST

AND STREAM, of December 8th, 1878, page 276, under the caption, "Pipe Fish." The upper edge of the pipe, as you will see, is broken, but I have no doubt it was a sound pipe, and that the growth or expansion of the oyster's shell caused the fracture; but be that, as it may, the whole thing bears evidence that the bivalve was brought forth and cradled in the bowl of a tobacco pipe, and that he is true to his nature, is shown by his close adhesion to his house. Truly yours,

J. F. MURDOCK.

Ans. This really valued curiosity has attracted much attention in our office. We have acted upon our correspondents suggestion, and turned it over to the New York Aquarium.—[ED. F. AND S.].



THE MOLES.—If there be truth in the statement that is going the rounds of the press, regarding that most retiring of quadrupeds, the mole, it is, just now, worth while to commend it, with whatever truth it may be found to contain, to the management of the Greenwood Cemetery. From their last report, we learn that such a war has been waged upon the ground-moles, in the interest of smooth turf and solid path, that in the past year nearly 1,800 of these little animals have been destroyed. And the item we have in mind records a very similar fact with regard to a very choicely-kept estate abroad, where a similar work of extermination was carried out. But there, it is said, the result was not all that could be coveted, for such was the unexpected and alarming increase of insects and slugs in the sward, that the noble proprietor, discovering that he had disturbed one of the balances of nature, set at work, at large cost, and restocked his grounds with moles. The statement, which comes with apparent authenticity, is an interesting one, and by no means unusual in its bearing and argument. The mole preys on what are a far greater pest to cultivated tracts than he can be, with all the vexation caused by his little subterranean alleys. All authorities declare that this annoyance, easily repaired by spade and roller, is far more than counter-balanced by the services of the humble little Talpa family, who are classed as insectivorous mammals, and deserve to be protected as such. When the gardener has banished the toad for its ugliness, the warblers for the sake of his small fruits, and the mole because he burrows lawlessly in his lawns and pathways, the folly invites its own speedy penalty, for an army of insects and creeping things are ready to improve all such advantages, and revenge the unwise slaughter. Greenwood may need the moles, as well as the birds. We are getting wiser on such subjects, but we make wisdom sometimes very costly.—*Brooklyn Union.*

Woodland, Farm and Garden.

QUAILS IN CONFINEMENT.

ALTHOUGH it is rather late for such information to be of service during the present season, yet the experience of some of our correspondents, who have been keeping quails through the winter, for the purpose of turning them out in spring, may be of great benefit to those who propose following their example another year. And we would here say to our numerous readers, who are writing to us with regard to procuring live birds for this purpose, that they have delayed too long. During the month of January, quails could have been purchased in our markets in any quantity, but at that time very few cared to take the trouble and risk of carrying them through; hence, the dealers, finding themselves with large stocks on hand, declined making further contracts with their western or southern sources of supply, and when March came, or even in February, no birds were to be had. The moral of which is that those who wish to replenish their stock of birds must procure them early, and provide for them until the weather permits of their being set adrift to take care of themselves.

One of the most successful of our friends in keeping his birds over, is Mr. James Bryce of Madison, N. J., and to him we are indebted for the cut of his coop or box, in which his birds have thrived, and which we give herewith.

The box is six feet long and four feet wide, and is raised by the supports H H four feet from the ground. The coop is divided by the partitions C C into three compartments. The ends and sides are perforated with augur holes. The top and bottom are alike, being made with boards, D D D D, left half an inch apart, and wire netting E in the middle. B B B represents the water tanks. As regards feed, Mr. Bryce gives his birds just as much as they will eat, morning and night, of wheat, buckwheat, rye and corn mixed, with plenty of fresh water three times a day, and gravel and wood ashes morning and night. He also gives them plenty of cabbage (cut fine) celery tops, etc., daily, and twice a week onions, cut fine and mixed with hay or grass seed. The advantage of this coop is, that the birds keep it, in a measure, clean themselves, the refuse, etc., passing out at the bottom, or the apartments can be cleaned separately. Thus far this season he has lost only six birds out of some seventy. The coop is kept on an enclosed piazza, which has windows and doors, and the birds get the sunshine whenever it is possible.

—An excellent liniment to apply to sores on horses' backs, legs, or elsewhere, can be made as follows: Take inner bark of the ordinary white oak, boiled down in an iron kettle until it is as black as ink; while boiling drop in a piece of alum about the size of a hen's egg. Never use a brass kettle to boil it in. This liniment is to be applied with a sponge, and, indeed, it is good for any sore or bruise. It is a safe thing to keep in any one's barn ready to use when occasion requires.—*Our Home Journal.*

HORSE FLESH SACRIFICED IN NEW JERSEY.—A Marlboro correspondent sends us the following notice of the great horse sale which took place there last week, at C. E. Cornelius's farm. He says:

"It was the opinion of all the local horsemen present, this was the most valuable sale and the most largely attended of any that has ever been held in Morris County. The delegation from New York City was immense, and many noted turfmen present, attracted no doubt by the brilliant display, to be sold without reserve. But, oh! what a sad shrinkage in values, paid and received for the same. I was told by good authority, that the celebrated stallion 'Kirkwood,' cost Mr. Carman more than all that was sold yesterday brought."

ORNAMENTAL PLANTING.

THE beauty of many of our country homes is sadly marred by the injudicious planting of ornamental trees and shrubs, and there is no branch of the landscape gardener's busines that demands more sound judgment, correct ideas, or refined taste. It is not enough to admire and appreciate a well defined and harmoniously colored landscape; to be able to judge of its merits, or defects, he must also be able to select the materials, and so arrange or dispose of them as to produce an effect at once the most powerful, agreeable, and perfect that they are capable of doing. To attain this end, the planter requres an amount of skill and knowledge only attainable by perseverance, study, and practice. These remarks apply principally to large and extensive country seats, but also bear weight with regard to less pretentious residences. In former years the rage has been altogether for mixed planting, without any regard to the future size of the trees or shrubs planted, or to the effect of the shades of color either in summer or fall (how often have we seen Norway spruce, and other large growing tree, that will not stand pruning without spoiling their contour, planted within six feet of a Carriage drive), but now a more tasteful and natural idea prevails, and planting in groups with reference to the future general effect, the ultimate size of the trees, and their coloring in summer and fall, is more generally carried out. Trees having a resemblance to one another in the size and form of their leaves may be associated in groups, but it is more desirable that they possess some other marked characteristic in common, such as color of foliage, bark, or flower, habit of growth, or form, etc. Thus when depth of color in leafage is desired, it associates are found in the Purple Beech, Elm, Oak, Hazel, or Barberry; when light colors are wanted they are at command in the Golden Birch, Alder, Elder, and Willow, as also among the naturally silvery foliaged trees, as the silver Poplar, Linden, Maple, Huntingdon and other willows, and Sea Buck thorn, while among strictly variegated trees and shrubs there exists a wide field to select from. The autumnal colors and tints of falling foliage deserve marked attention. The rich scarlet and purple of the Oaks, Liquid Amber, Nyssa, or Scarlet Maple, the golden yellow of the Norway and other Maples, Tulip trees, etc.; the chestnut with its yellow and brown; gorgeous festoons of Virginia Creeper, or Yellow Celastrus, contrasting beautifully with the deep green of the Spruces, Hemlocks, or other evergreens. Color in bark is most appreciable when branches are denuded of their foliage, and small groups having distinct colors tend to relieve the dull monotony of the winter and early spring months. White Birch, Linden, Golden Ash, Copper, Purple, and Golden Willow, Virgilia, the red Dog-wood, etc., all work in well; while Deutzias, Spiræas, Weigelias, Dwarf Magnolias, Tartarian Honeysuckle, Pavias, the Japanese Judas Tree, double Almonds, and the dwarfer Evergreens, either singly, or in groups, may fill up the foreground, and give lightness and beauty to the carriage drive and lawn during the whole season. Irregularity of outline to the lawn gives an idea of size, and the margins and points may be well filled up here and there by a border of hardy herbaceous and other plants. Daphne Cneorum and other dwarf flowering plants—the noble and striking Pampas grass, Arundo donax variegata, or Arundo Conspicua, in prominent positions, or as single specimens on the lawn, while, of course, nearer the house, the flower-beds are located, radiant with beauty during the summer and fall months.

NOTES ON ORANGE CULTURE.

MANDARIN, Fla., March 17, 1877.

EDITOR FOREST AND STREAM.

Theories concerning the cultivation of orange trees are so numerous and varied that one is at a loss sometimes to know which to adopt. Almost every one has some pet idea to which he pins his solemn faith and indefatigable energy, and the inexperienced may well be puzzled at such variety of opinions expressed on almost every part of the subject.

It is stated that high-land is the only suitable place for a grove; but what about the numerous thrifty groves on low land that bear their yearly abundance.

There are numerous learned essays on the necessity of a substratum of clay, or marl, or what not, but I have seen groves where, if there were anything of this kind, it was so far beneath the surface as to be only discoverable to the well digger.

There are groves on the hills where the soil, during the season, retains barely sufficient of the rainfall to nourish plant life; and there are others on the flat, low lands, where the drains are dug deep, and the trees set high on ridges, to escape the continued superabundance of water.

The man who has paid a hundred dollars for his acre of choice hammock, and he who has homesteaden from the government his tract miles back in the pine lands, possess their groves, with no apparent difference in the condition of the trees except what is due to fertility of the soil.

The rich, black hammock will, unaided by fertilizers, produce fine growth, as will also the better quality of pine land; but even on land which is so poor that it seems little else but white sand, the orange tree will wave its green leaves in vigorous growth, if cared for and fertilized.

For the first few years the plough should do its duty in keeping the weeds and grass down, but when both foliage and roots have spread far and wide, the plough should be run lightly, or the cultivator or harrow used in its place. So rapid and extensive is the growth of the roots, that when the grove is well in bearing, the space between the trees is practically covered with the fine, yellow fibrous network, and the rake is then deemed the proper thing to loosen the soil, and avoid injuring the roots.

Pruning the trees is practiced more or less by some, and by others not at all. I shall not say which is best, as the tree appears to flourish either way, and he who has his grove may take his choice between the native luxuriant growth, or the pruned symmetrical tree. In this vicinity, however, pruning is done but moderately, if at all, many preferring low-headed, bushy trees, and some being of opinion that the low foliage affords a protection against frost, and against the too fierce rays of the sun, and keeps the roots cool and moist in hot, dry weather. Possibly, as in many other things, the best course may be a medium between the two extremes, the pruning knife being used sparingly.
